General Oil Refining Practice

Selection of refinery site; boiler plant and pumping requirements, details of distillation and treatment processes for oils, pitches and asphalts; storage; fire protection precautions; railway trackage and wharf requirements.

C. D. Dean, A.M.E.I.C.

Paper presented before Toronto Branch, The Engineering Institute of Canada, October 21st, 1920.

Among all the great mass of technical literature, that devoted to petroleum refining, is very meagre, partly on account of the great complexity in the physical and chemical characteristics of crude oil and the products therefrom. In the past the technologists in the industry have been made from within and the extensions they made to the knowledge of the art were of a confidential nature until comparatively recent times, when the academically trained man with the scientific mind has found a place therein with the result that literature pertaining to petroleum has made its appearance, and no doubt from now on will increase in scope and volume.

The difficulty confronting anyone interested in the art and anxious to get a quantitative as differentiated from a qualitative knowledge of the industry is the preliminary data to which the usual engineering principles can be applied and in this paper by courtesy of Imperial Oil, some — at least — of this data will be given.

Selection of Refinery Site

In the selection of a refinery site, aside from the usual economic consideration such as, markets, transportation, land values, labor and taxation, the primary physical requirement is fresh water in comparatively large quantities for boiler and condensing purposes. Sea-board plants use sea water for condensing purposes if fresh water is scarce or difficult to obtain, but one sea-board plant secures fresh water from a river 22 miles away.

Depending on the method of receiving crude and shipping finished products, as well as the variety of products to be manufactured, it is found that from 10 to 20 acres of land will be required per 1000 barrels of crude capacity daily. To minimize pumping heads, steam and electric power transmission losses, etc. the area should preferably be square and level, but as standard trackage is a necessity not only to handle current car movements, but also as storage for surplus empties, a rectangular area is usually selected—if available.

The total water requirements are usually found to lie between 1,000,000 and 1,500,000 Imperial Gallons per 1000 barrels crude capacity daily, depending on the variety of manufacture, and ordinarily the pumping rate will be found to be quite uniform. For plants located on level ground the combined static and friction heads are rarely over 100 feet and during the past ten year the use of centrifugal pumps for this purpose, operating at speeds of 1500 to 2000 R.P.M., has increased, due to their well-known characteristic of flexibility.

Aside from the requirements for mechanical power and heating, a great amount of steam is required for distillation and other uses in the process of refining and it is found that the steam requirements in our Canadian climate necessitates a boiler plant of between 500 and 650 H.P. per 1000-35 I.G. barrels crude daily. The load is usually found to vary quite widely and overloads for sustained periods 25 per cent above nominal rating are common. The water tube boiler is now coming into general use, but the nominal rating is figured 50 percent higher than the builders' rating and there is sufficient overload capacity left to take care of the variations encountered in refinery work.

Boiler Plant

Oil refining is a process carried on throughout the 24 hours each day and the boiler plant is the mainstay on which operation depend. The selection of the proper size of units for a boiler plant is sometimes rather difficult, but for refineries of up to 10,000 barrels of crude daily, 300 to 500 H.P. units are used. Above 10,000 barrels per day crude capacity, any large size of unit can be used, but it is generally felt that not more than 15 percent of the boiler capacity should be shut down at a time for repairs or cleaning.

As one-third of the total refinery fuel requirements which if liquid fuel, would vary between 20 and 30 percent of the crude run daily, is consumed in the boiler plant, economizers and super-heaters, the former preferred, are a regular installation and it is pretty generally the present day to install recording thermometers and water and steam meters, as well as CO_2 recorders, etc. in order to check and maintain efficiency and to ascertain correctly steam costs.

In certain locations fuel oil is used as refinery fuel, but it has so many advantages of an economic nature that makes it ideal as a fuel for ships and for heating purposes in cities, especially for offices and for public and private institutions, where transportation or cartage is a considerable item in fuel costs, that an effort is usually made to leave the fuel oil for these purposes. Generally speaking, coal is favoured as a refinery fuel and when it is used in boiler plants, especially in those of 1500 H.P. and up, stokers and power driven coal and ash handling apparatus are used, as in nearly every case they can be economically justified.

It is the general practice to locate the steam plant as near as possible to the centre of the refineries and carry the steam pipes supported on stanchions to the points where steam is used. In many of the processes, exhaust steam is as advantageous as the live steam and a network of exhaust lines, practically duplicating the live steam lines is installed. The steam pressures vary from 100 to 125 pounds gauge, while the exhaust line pressures are usually set at from 6 to 10 pounds gauge with an average of 8 pounds, and standard steel line pipe is used in both cases.

In general, it is found that the uses for exhaust steam are so varied and continuous that no waste from the exhaust lines occurs, and it is a rare thing to see the relief valves on them blowing. The current practice is to cover live steam lines with one inch of 85 percent magnesia, and one inch of hair felt with staggered joints and a final protective covering of roofing felt, while the exhaust lines have only a covering of one inch of 85 percent magnesia with roofing felt protection.

Under these conditions the radiation losses in live steam lines are found to be approximately .248 B.T.U. per hour per square foot of external surface of pipe per degree difference in temperature between the steam and the outside air. The radiation losses from the exhaust lines are found to be approximately .463 B.T.U. per hour per square foot of external surface of pipe per degree difference in temperature between the steam and the outside air. Taking the average boiler load, throughout the year it is found that the actual heat losses, from both live and exhaust lines, rarely exceed 5 percent of the generated steam.

The prices of coal have risen so much, compared with the prices of insulating materials, that a double jacket on exhaust lines would probably be financially justified. In designing live steam lines, the effort is made to keep the pressure drop for lines supplying large units of power to not more than 5 pounds.

Power Requirements

The requirements for mechanical power for pumping and other purposes, up to a few years ago, were all provided for directly by steam apparatus. In pumping, the duplex steam pump was used, while the throttling and occasionally the automatic cut off steam engine was depended on for the general mechanical purposes, incident to the business. For some time a controversy raged, as to whether or not there was a loss in using power apparatus, which required large quantities of live steam when the exhaust could be used so conveniently in the process.

It has been found by more refined investigation that the losses incident to the blowing of exhaust lines have been practically eliminated by the use of more efficient steam using apparatus and besides a real saving in boiler fuel for the same refining capacity has resulted from the same cause, seemingly altogether due to the more efficient use of the heat units absorbed in the prime movers.

The substitution of the centrifugal pump for the old style steam pump has had the largest effect in determining the modern trend for mechanical power in oil refining work. It is the nearest approach to a duplex steam pump for reliability in refining operations where liquids of a viscosity comparable with water are to be handled and its use has introduced the electric motor. Profuse lighting is a necessity for oil refineries and with the advent of the electric motor, an electric power plant became standard apparatus in a well ordered layout.

It is usually found for lighting and all mechanical purposes, except pumping high viscosity oils, the electric power consumption for a plant on level ground will be approximately 1000 K.W. hours per 1000 barrels of crude run. For plants built on sloping ground where comparatively high static pumping heads are encountered, it will be found that the electric power consumption will vary between 1500 and 1750 K.W. hours per 1000 barrels of crude run.

It is generally found that the maximum peak at the switch-board will be not more than 2-1½ times the 24 hour average, and the demand factor, figuring input to motors and watts per lamp, ranges around 40 percent, but this latter figure must be accepted with reservations for obvious reasons. As far as the peak load ratio is concerned, intermittent services like loading and discharging steamers are not included because as they usually occur throughout a 24 hour period continuously, they simply add their input rating to the refinery peak. While it is true the refinery process is continous, it is found that the peaks occur between 7 a.m. and 6 p.m.

The power characteristics usually selected are 440 volt, 3 phase, 60 cycles or 25 cycles-depending to some extent on the type of prime mover, and 440 volt apparatus was chosen primarily, because of the opinion that prevailed that this voltage would be safer for the operators, although the writer believes doubts on this points are confessed. The lighting voltage is all 120 and in the case of a small refinery is stepped down at the switch-board to save transformer costs. For large tramsmissions and comparatively large powers, where economically justified 2200 volts with step-up transformers are used and latterly for certain purposes 2200 volt apparatus is coming into use, although it is considered in its experimental stage, as far as oil refining work is concerned. Motor drives throughout are either the constant speed or variable speed induction motor, the latter being a rarity as it is only used to drive plunger displacement pumps.

The power factor at the switch-board is found to be between .8 and .9 although on occasions the writers has seen certain plants go as low as .7, but it will be found that if the water pumps are carefully calculated and the oil pumps are designed to take the worst case, as far as head conditions are concerned, the motors will run close enough to full load to give good power fadtor, especially if the generator capacity is flexible enough to have as near full load operation as possible. The transmission lines give a line loss of from 5 to 8 percent and trunk lines are generally liberally figured, because of the certainty of adding additional apparatus from time to time.

The type of prime mover used to drive the generators, is either steam engines or turbines oil engines of the full Diesel or semi-diesel type and gas engines. The steam engine is favored for units up to 200 H.P. each, while for larger units than this the direct connected turbine or the belted oil engine is chosen with preference for the former unless the advantages of the latter are overwhelmingly in its favour.

The gas engine driven units are not adopted unless the plant is located contiguous to a large field yielding natural gas or unless the refinery produces large quantities of by-product gas and only then when fuel is high, giving the gas a high comparative value. As a rule the oil and gas engines are not flexible and cannot respond to overload without distress, and the manufacturers usually recommend that they be operated on continuous loads of 80 percent or less than their rating.

Crude Oil Reception

Crude oil in quantities is received by tank car, by pipe line and by tank ship, or any combination of these methods. The most favoured means are by tank car or tank ship, because these means are independent of any field. As a rule, oil producing is a hazardous game and a pipe line usually requires a comparatively large capital expenditure. For short distances to the sea-board, a pipe line is preferred to tank cars, if the field warrants, while for long distances over land, the decision for pipe is a matter of considerable moment, and requires the exercise of judgment, based on long experience in the vagaries of oil production.

When crude is received by pipe line the tankage for receiving it is usually in two units of sufficient capacity to hold a full week of pumping to guard against possible shut-downs of the line which frequently occur, enough to warrant the expenditure for this safe-guard. The two units are necessary to gauge receipts properly.

When receipts occur by tank cars, provision must be made for interruptions in railway service, as well as for the vagaries of train movements and transfers, so that it is customary to carry about one week's supply, although it is not unusual for the tank car situation itself to dictate the amount of storage necessary for crude because of fluctuations and peaks in the movement of finished products at certain periods of the year. When crude is received by tank ship the capacity of the largest ship, plus about 15 days supply must be provided for due to the hazards of navigation and the difficulty of adhering to a pre-arranged schedule.

In the case of crude receipts by tank cars, pumps must be provided for unloading and these are usually made large enough to permit unloading and the re-dispatch of the empties within the standard 8 or 10 hours day or between switchings if two per day can be arranged. While it may seem like an economic waste to dispatch cars empty, the fact is cars in crude service must be cleaned to carry refined oils and besides the cost of cleaning and the time lost to do this, is the uncertainty of load in the direction of the crude supply. Tank ships are equipped with steam pumps for discharging their cargoes, but the rate of discharge which should be high to minimize avoidable demurrage, is influenced by two factors; the capacity of the ship's boilers and the allowable pressure on the hose connecting the ship to the permanent lines on the dock. If the lines to the crude tankage are long or if the static head ashore is comparatively high, shore booster pumps are used of large enough capacity to accommodate the rate of discharge of the largest ship.

First Distillation

The first distillation of crude oil occurs in crude stills, which are operated either continously in a battery or batch singly. Sometimes a combination of methods is used but the effort always is to get the most out of the crudes without using too much apparatus and the whole operaton depends on the characteristics of the crudes - no two of which are alike.

In the first distillation the separations that are made are naphtha distillate, refined oil distillate, gas oil, lubricating distillate and fuel oil, as well as coke if distillation is carried to dryness. These distillates are usually run to gravities which have a range of boiling points, in which considerable latitude is necessary but the aim is to approximate a degree of separation that reduces the necessity for subsequent distillation.

The continuous method lends itself to an exchange of heat between the ingoing charge and the distilled vapour, as well as the residual bottoms and thereby gives an opportunity for fuel saving, but it is only used when running for fuel oil or in refining parlance topping, because it does not give good separation. In running for fuel oil, the aim is to prevent cracking and while distillation occurs at what is called "atmospheric pressure" the temperature rises and reaches the critical temperature for certain fractions. To eliminate this tendency in distillation, the temperature are reduced by introducing dry steam, which owes its efficacy to the law of partial pressures, but which, as before mentioned, cause the fractions to overlap.

To get the most from crude in the sense of securing all the products with characteristics that are the most useful in industry, it seems to be necessary to distil to coke and do whatever cracking will naturally occur with a given crude at atmospheric distillation, which in reality is about ½ pound gauge.

In skimming operation alone it is ordinarily found that from 8 to 35 cubic feet of fixed gas, under standard conditions, is produced per barrel of crude run, while in coking from 50 to 120 cubic feet of fixed gas is produced, and it is found that a relation exists between the gas and coke produced. There is a distilling loss which probably averages for paraffine base crudes around 5 percent, but for asphaltic crudes goes as high as 15 percent. As far as they will apply, considering the uncertain element from cracking, the specific heat of oil on the pound degree Fahrenheit basis is ½ B.T.U., while the latent heat ranges between 140 and 150 B.T.U. per pound for atmospheric distillation.

An effort is made to secure as good fractionation as possible in the first distillation by using reflux towers through which air circulates and knocks down the heavier fractions in the vapour stream. In designing these towers they are made as flexible as possible by some system of control of the air circulation and for certain crudes and certain rates of running, it is sometimes necessary to jacket the towers, at least, in part.

The modern still of 1000 barrels charging capacity, has two towers and 3 worms or condensing coils, or 3 towers and 4 worms and the design of worms is made altogether on the basis of a low rate of heat transference, about 1000 B.T.U. per square foot of surface per hour, so as to provide great flexibility. Ordinarily the stills run either a 2 day or 3 day schedule, depending on the characteristics of the crude. The condensing water used is altogether based on the heat to be extracted from the oil and the rate of distillation, and for oils that have no viscosity the temperature is allowed to go as high as 120 to 140° F.

For such oils as have viscosity at ordinary temperatures, as would retard flow in the worms and thereby increase the time schedule the practice is to cool these to a temperature that gives them low viscosity and this is done by taking the condenser water at 120 or 140° F. from the light worms and using it to cool the contents of the heavier worms.

It will be appreciated that distilling to coke means very high temperature and the flue gases reach as high as 2000° F. towards the end of the run. As a general thing, the temperature of operations are all very high and as a result the labour needed to affect current repairs is as great as that needed in the operations. All still equipment is designed to permit the making of repairs as cheaply as possible by arranging the fire sheets and brick work so as to minimize the amount of tearing down in order to affect the real repairs. For the same reason the worms are built of cast iron flanged pipe installed so that any section can be removed and replaced without disturbing the other parts.

The draw-offs from the towers are arranged so that they can be sent back to the stills or on through the worm to the receiving-house and the run-backs to the stills are equipped with traps. Each worm runs to a look-box or turret in the receiving-house and the manifolds delivering to the receiving tanks are ordinarily placed in the ground floor of the buildings.

The gas is taken from the discharge end of the worms by a suction of about 2-½ inches of water, so as not to lift off any light vapours.

Treatment of Distillates

The finishing of the distillates is done by treating to remove unsaturated compounds, which give odor and color, etc. and subsequently distilling, but the order in which these are done depends on the product. In general, it may be said that treating is the first process in naphthas and refined oils and the last process in lubricating oils, but this is not necessarily so.

The treating of naphtha distillates is done either continuously or batch, and consists in bringing the distillate into intimate contact with commercial sulphuric acid of 66° Be. and after the re-actions have proceeded allow the sludge to settle out. The oil is then washed with water to remove all traces of the acid that can be removed by this means, then settled again, after which it is treated with caustic soda or soda ash to neutralize the acid that still remains. The sludge is again settled out after which the oil is washed with water. In general, it is found that the quantity of water required in treating is equal to about 35 I.G. per barrel, while the quantities of acid vary between ½ and 12 pounds per barrel, and the quantity of soda solution is approximately 12 gallons per barrel. There is always a loss in treating, varying between ½ and 3 percent.

From the treating plant the naphtha distillate is ready for finishing and is charged constinuously to a steam still, where the gasoline is extracted by fractionation leaving a bottom or residue that is largely kerosene.

Steam stills, since they run continuously, are equipped with vapour heat exchangers, oil heat exchangers, oil coolers, water separators, etc., and in addition have over the still a large tower, where the ingoing charge trickles over stones through which the out-going vapours pass. The object of the tower is to knock down any kerosene

fractions that may be leaving the still with the gasoline. The heating medium free, live or exhaust steam, is introduced into the still beneath the oil surface and it owes its efficacy to the operation of the law of partial pressures, previously mentioned. The pressure in the still is not allowed to exceed about ½ pound gauge, if possible, but on occasions it may, and the still is, therefore, usually built with spherical head's or is otherwise braced. These stills are built usually of 1200 or 1500 barrels batch capacity and the running rate depends on the condensing surface in the worms which is, therefore, made ample. It is found that approximately 8 pounds of steam is required per gallon of gasoline or roughly 1 pound steam per pound of gasoline overhead and the charge is fed at the rate of about 60 to 75 barrels per hour per still, requiring about 450 to 550 boiler horse power depending on the percentage taken overhead. On the condenser end of the vapour line means is provided for expanding the vapours before they enter the worm so as to take out any condensed steam and at the outlet end of the worm a trap is provided that takes out the most of the water from the interior of the worm and discharges it to a sewer. It may be mentioned here that for this and all other stills, about a two inch thickness of magnesia blocks and a weather protection is used to minimize radiation losses.

The treating of refined oil distillate is similar to that for naphthas, except that this is always batch in a loose top cone bottom agitator. The reason for this is that the oil has some viscosity and it is difficult to get an intimate mix of the chemicals and oil without violent agitation. This agitation is secured either by blowing with air or by circulating through a pump. Blowing with air means large losses; circulation with a pump means longer time and therefore large investment, but at the present time, both systems are in use. If, however, the oil contains large quantities of sulphur, blowing must be resorted to in order to get efficient chemical action.

After treatment and neutralization, the kerosene distillate is charged continuously to a battery of rerun stills which are, as in the case of crude stills, of about 1000 barrels capacity each, using bottom steam. With these stills use is made of vapour heat exchangers and towers, as well as oil heat exchangers and coolers for the residual bottoms. The condensation in the vapour heat exchanger and the tower is removed through separate cooling coils, while the vapours passing the tower are conducted into a worm. From these stills is taken a gasoline cut and refined oil as well as what is known as a re-run cut for re-treatment and re-distillation and the bottoms go to fuel oil.

There are many specifications for gasoline and refined oil, but in operating in the refinery the former is run for boiling points, while the latter is run for flash and viscosity which in a measure are imperfectly related.

The lubricating distillate contains the waxes or at least most of them, and before it is ready for finishing and treating, this wax must be removed. Present day practice involves the cooling by refrigeration of the whole distillate to between 32° F. and 0° F. and forcing the distillate under about 1000 pounds per square inch through filter presses where the wax crystallizes out and allows the oil to drip through. In cooling the distillate, it is fed through chilling machines, which are a series of long pipes, in which screw conveyors work to prevent the wax from adhering, and around which the brine is circulated. It requires a press for every 200 to 250 barrels of distillate and about 25 tons of refrigeration per press. After the press is full of wax, the filter plates are loosened and the slack wax drops into a hopper with a conveyor in the bottom, where it is broken up into small blocks and discharged into rundown tanks. In the rundown tanks the wax is melted and heated to quite a high temperature when it is pumped to the wax sweaters.

Slack Wax

The slack wax contains about 50 percent of its volume as oil, which must be removed before the wax is ready for treating and finishing in commercial articles. Wax sweaters consist of two sets each, consisting of a series, usually 12 to 24 shallow pans, one above the other carried on a frame work and enclosed within a brick or concrete building. The building has no windows, but both ends are almost completely doors, and the roof has ample adjustable ventilating openings, while the sidewalls are covered with steam coils.

In each pan is installed a closed coil on top of which is a screen of about ¼ inch mesh, although coarse sand is sometimes used. Each pan is filled with cold water up to the screen, and on top of this is pumped the hot slack wax, after which cold water is circulated through the coils if necessary to cool and solidify the wax. After the wax has become solid enough the water is run from each pan to the sewers and the doors and ventilators are shut, after which the steam is turned on in the building which heats the air up and allows the wax to soften sufficiently to allow the entrained oil to filter through to a pipe line that carries it to the pressed oil tank where the oil, which escaped from the presses when the wax was being pressed out, is stored preparatory to being transferred for further treatment. After the oil has been sweated out, steam is turned on in the coils within the pans which melts the wax and allows it to run down a separate line into what is known as a rundown tank building, which is plentifully supplied with steam coils. From this building the wax is fed to the wax treating plant, where it is filtered through Florida clay to eliminate the colouring matter and is then sent to the candle works where it is moulded into candles and other shapes for consumption.

The oil from the wax presses is delivered to the reducing department, where it is distilled in reducing stills either continuously or batch. These stills are never run down to coke and all the overhead distillates are closely fractionated into the various grades of lubricating stocks. The oils all carry considerable viscosity and they are allowed to issue quite warm from the ends of the worms, from 125° F. on up, depending on the viscosity. The bottom is the very high viscosity oils which at temperatures little below boiling temperature would flow very sluggishly, and it is termed a botton product. As cracking, which destroys viscosity, is to be eliminated great quantities of steam are used, about one pound for each pound of oil overhead, which must be disposed of and in order not to make it necessary to install too large a worm the steam is withdrawn from the worm after the oil has become liquid by a light suction induced by a jet of water. When the stills run continuously, an effort in made to converse

heat by creating a suction through an exchanger, where the steam gives up some of its heat to the ingoing charge.

The lubricating distillates, including the bottoms, are transferred to the treating plant where they are treated to remove objectionable matters of various kinds which are due to the insaturated compounds.

The treating is done in agitators which are equipped with closed coils running up and down adjoining the interior of the shell vertically. After charging, the steam is turned on and the batch is heated up to reduce viscosity and the acid dumped in successive doses, while the whole is agitated violently for some hours by an excess of air. The acid heat and the heat from the coils serves to allow the sludge to settle out, when it is drawn from the cone bottom of the agitator into either an acid coke pit or cooking kettle.

The treatment of lubricating oils some times necessitates as much as 50 pounds of acid per barrel of oil and there is a great deal of sulphuric acid left in the sludge and in a sludge coke pit; this is allowed to fester and drop out a coke, which can readily be handled and burned. With a cooking kettle, however, live steam is turned in the mass which separates the uncombined acid and the coke and this uncombined acid is pumped to the acid restoring plant and the coke, which is much less in amount in this case, can be handled and burned.

The treated oil in the agitator is now transferred to a wash tank, which is about double the capacity of the agitator, and which is jacketed and equipped with both open and closed steam coils. Here the oil is thoroughly washed with hot water about 180° F. and as the oil has been heavily treated, larger quantities must be used. After treating and washing the oil is neutralized with a soda solution and again washed with large quantities of hot water. The batch is then left in the wash tank and is maintained at a high temperature by the steam coils to permit the water to settle to the bottom. After all the water has settled out that can be eliminated in this way, the oil is transferred to a bleacher which is a tank, contained within a building, and in which is a large steam coil as well as air blowing coils. In the bleacher the oils are blown bright, i.e. the moisture is all eliminared, and are then transferred to the stock tanks, either for shipment or for filtering through clay to remove soapy substances that attract moisture and that in certain services would be deleterious.

Pitches and Paving Asphalts

One of the modern developments in the art of refining, which is growing enormously, is the production of pitches and paving asphalts from asphaltic base crudes, which in America come from California, Texas or Mexico.

This distillation is conducted batch in 1000 barrel stills, the condensers of which have large worm capacity. For certain crudes comparatively low in asphalt or pitch content, the stills are equipped with one or more towers for fractionation, but when the asphalt content is comparatively high these are notused. Mexican crude is the only one that the writer knows of that is used in Canada for the production of asphalts.

The various light oils come over successively, and depending on their boiling points comparatively close fractionation can be arranged in the tail house on the basis of gravities. The present practice is to produce asphalts as a bottom product, that is they are not driven overhead, on account of the high temperature necessary to do this. The steam serves the purpose of preventing the rise of temperature and thereby prevents the cracking of the bottoms, and asphalts can be produced that will have a minimum of carbon content. The steam is drawn from the worms beyond the point where the oil has condensed and is condensed with a water jet in a sealed chamber from which the still gas escaping with the steam is pulled by exhausters and burned beneath the stills. In order to cheapen the cost of operation, insofar as the use of bottom steam is concerned, some California refineries use vacuum stills operating at from 24 to 26 inches of vacum, and in addition introduce small quantities of steam which if properly distributed facilitates circulation and thereby prevents local heating.

High melting asphalts are produced by blowing air through the bottom, as it lies in the still and a slow fire is maintained beneath. It is claimed that the effect of the air is to oxidize some of the hydrogen in the chemical structure of the pitches producing the higher in the series with consequent raising of the melting point and other physical characteristics that go with this. It may be mentioned that about 500 cubic feet of free air is required per minute per still for oxidizing purposes.

Distillation under Pressure

In the early days of petroleum refining the effort was made to produce all the refined oil, fuel and lubricating stocks that the crude would yield and waste the light fractions, now in such great demand, and a good crude was considered to be one in which the percentage of fractions lighter than those permissible in refined oil was low. The development of the motor car, truck and tractor has radically changed the situation and crude oils are now valued, very largely on the basis of their gasoline and lubricating oil content. It was quite natural to expect that with a knowledge of the fact that crude oil can be cracked at atmospheric pressures in a coking still, an effort would be made to see what advantage would lie with distillation under pressure. Several patents in this direction were secured very early when the demand for gasoline showed evidence of exceeding the supply, and there are a few that are being commercially used on a large scale by big refineries in the United States and Canada. There is an immeasurable host of patents of this kind appearing every month, but they are mostly mechanical deviations from the existing apparatus and depend for success on the same principles on which all are based.

The first principle is that oils suffer a redistribution of molecular structure when raised to their critical temperatures and the heavier fractions have critical temperatures lower than those for the lighter fractions.

The second principle is that as pressure is made use of to get higher temperatures it is necessary to produce a fixed gas as well as condensible vapours in the still in order to hold pressure.

Probably the most successful apparatus in use is that covered by the Burton patents now owned by the Standard Oil Co. (of Indiana) and licensed to various companies in the United States and Canada. The stills use a gas or fuel oil of 30 to 35 gravity, as charging stock

which contains comparatively heavy fractions, having little or no lubricating properties and which would ordinarily reach the market as fuel oils. They are charged batch and run semi-continuously at about 96 pounds gauge pressure and have a capacity varying between one and two hundred barrels each per day. Approximately 50 percent of 50 gravity distillate is taken off ovehead and the bottoms are about 22 to 26 gravity. There is a loss of about 3-½ percent in operating which is nearly all gas. These stills sometimes have quite complicated overhead fractionating equipment to knock down for recracking the heavier vapors, as there is a rise in still temperature occurs of about 100° F. during a run as the gravity of the bottom increases.

The fuel consumption is about 1-8 of the charge if liquid fuel and the fixed gas produced is around seventy-five cubic feet under standard conditions per barrel charged. The still temperatures vary from about 640° to 740° F. and the flue temperatures are around 1200° F. The latest practice is to install steam superheaters in the flues to supply superheated steam to the various continuous and reducing stills using bottom steam.

The distillate is treated either continuously or batch, similar to the method of finishing crude naphtha and is then distilled continously either in fire stills or steam stills and yields gasoline, refined oil and a residual bottom which is gas oil.

The general refinery production of still gas, which will average probably about a hundred thousand feet per 1000 barrels per day, is usually burned in the refinery although instances in the United States are not rare where it is sold to gas companies direct as enrichment for water gas, etc. In refineries a very elaborate system of exhausters and gas lines is installed to dispose of it and when the production is large with wide fluctuations in the rates of production, as sometimes occurs, gasometers are used to prevent loss.

The still gas is usually found to have a heating value from 1000 B.T.U.'s per cubic foot to as high as 1800 B.T.U's per cubic foot, depending on the amount of gasoline vapour carried. Modern practice now calls for absorbers to extract the vapours from the gas which is usually done by forcing the gas after cooling, under low pressure through towers in which a menstruum of gas oil or any other similar heavy oil, the inital boiling point of which is considerably higher than the final boiling point of the absorbed naphtha can be,—is trickling. It is ordinarily found that the menstruum will absorb about 10 to 11 per cent of its volume as naphtha and a gas that will yield one Imperial gallon per 1000 cubic feet is considered to pay for the extraction. The menstruum with entrapped naphtha is steam stilled under about 15 pound gauge pressure and the recovered naphtha, after treatment, is mixed with the current production of naphtha. On steam stilling, it is found that a loss of about 5 percent of the volume of the menstruum occurs, i.e. this amount goes overhead with the naphtha.

Storage

Practically everything including waxes and asphalts—but of course not coke—is stored in tankage and handled by pumping. The tankage is all steel and varies in size from 5′ diameter by 10′ high, having a capacity of 35 barrels to 120′ diameter by 40′ high, having a capacity of 80,000 barrels.

The tanks are designed for a stress of 20,000 pounds per square inch on the net area of the shell, when full of water, but no plate in the shell or bottom is less than ¼ inch thick. Generally speaking the bottom is made of 3-8 inch steel and the roof plates of 3-16 inch material. The roof is designed to carry a wind and snow of 30 pounds per square foot and while the practice of a few years ago was to install truss roofs quite extensively, the present practice is to use I beam supports, bolted at one end and free to slide on the other to take care of tank distortion, due to settlement of the foundation or varying elongation of the materials with differing oil heights.

Tanks varying in capacity from 20,000 barrels to 80, 000 barrels weigh about 9 pounds per barrel, while for tanks from 10,000 barrels to 20,000 barrels the weight of steel per barrel is about 10-¼ pounds and for tanks from 5,000 to 10,000 barrels the weight is about 12-½ pounds per barrel.

The space occupied per tank is quite variable, but very roughly follows the plan of allowing one square foot of ground per barrel capacity. The deviations from this rule are frequent however, depending on the shape of the tank lot and local regulations, if there are any. As far as possible, for light products ,i.e. gasoline, refined oil, fuel oil and crude, the tanks are surrounded by dykes - built high enough to hold the contents of the tank should disaster occur, but there is a rule restricting the height of the dykes to 6 feet, and it is adhered to quite religiously on account of the need for accessibility for hose reels, etc.

For certain heavy products, such as heavy crude oils, fuel oils, lubricating oils, waxes and asphalts, the tanks are equipped with very elaborate heating coils, the surface of which is designed on the basis of the highest expected pumping rate, and in addition, certain lubricating tanks and all wax and asphalt tanks are jacketed with four inch hollow tile jackets to conserve heat and assist in maintaining high temperature. Every tank is equipped with two or more water draw-offs, in the shell near the bottom, which are arranged so as to remain full of oil after the water has been withdrawn from the tank. In tanks 25′ in diameter and larger, two manholes are provided, one on the roof and one on the shell near the bottom.

The oil lines are connected through the shell either at the top or the bottom. The top connection is favoured by some people, as line breakage does not involve the loss of the contents. It does, however, mean a continuous maximum pumping head and the bottom connection on this account is generally used. To safe-guard as much as possible against loss from line breakage, the line inside the tank is on a swing either by using a specially constructed valve or by using two ells so that the entrance of the pipe can be raised above the oil level.

The oil lines are all screwed steel pipe and are made large enough to give a total head for a refinery on level ground of from 65 to 75 ft., i.e. when centrifugal pumps are used, but for asphalts, waxes, etc. the pumping heads vary, although initial starting pressures greater than 100 lbs. per square inch are not favoured. In general for all important inter-refinery process pumping, no line is made less than 6″. Process pumps, motor driven, are either centrifugal driven by constant speed motors, or triplex single or double acting, or some of the patented positive displacement pumps driven by variable speed motors.

In pump-houses, which are located in carefully selected locations and are as few in number as possible, the pumps and motors are separated by brick walls as an additional protection against fire. For certain purposes, such as pumping waxes and asphalts, etc., no motor driven apparatus can be used, because the power required at starting is several times that required after the volume of oil in the line gets moving, and it is usual to put in a high ratio duplex steam pump for this work, as the exhaust steam need not be wasted.

Fire Protection

Fire protection is an important consideration in an oil refinery and large expenditures are made to provide fire fighting facilities on an elaborate scale. All tanks are equipped with 2″ steam fire lines, which enter in two places on a diameter near the top and which during thunder storms are opened. If steam enters a tank and displaces the air, the risk of fire is nil, but after an explosion if the roof blows off, and it nearly always does, steam is comparatively useless. During the past five years a new system of fighting oil fires has been developed known as chemical foam and there are three commercial foam formulas in use now.

The foams are mixed right at the tank in a mixing chamber either within or without and when discharged on the surface of burning oil, act as a blanket. The protection required per tank is difficult to estimate and is usually based on judgment. A conservative figure is that about three feet of foam per tank will be needed which is equivalent to about three gallons of solutions per square foot.

Current practice does not call for the installation of foam storage, totalling the whole risk, and it is customary to aprovide storage for, roughly, 10 percent of the tank risk. The foam making solutions are kept in separate tanks until required. In all the foam making formulas, the acid solution consists principally of 10-½ to 12 percent by weight of aluminum sulphate and 85-½ to 89 percent of water. The soda solution consists of about 8 percent of sodium bicarbonate and 89 to 91-½ percent of water. These produce the carbon dioxide and the other ingredients to produce the bubble for containing the gas, differ.

In the first one glue, glucose and arsenous oxide is added to the soda solution. In the second foam powdered extract of licorice is added to the acid solution, while in the third foamite is added to the soda solution. The first two are not used much for new installations, as the bubble materials deteriorates rapidly. In all cases, the expansion by mixing is about eight to one when fresh solutions are used, but ordinarily refinery storage solutions will give an increase of about 6½ to 1.

To cover a refinery risk means quite an extensive network of lines, as well as powerful pumping equipment, and it may be noted that foam hydrants are located at strategic points to permit the use of foam an other risks besides tanks.

Probably the most expensive fire fighting apparatus consists of the usual water protection. This consists of the well known hub and spigot pipe which in refinery work is all class "C" and powerful pumping equipment with boosters wherever necessary. It is the aim to provide for at least 12 standard 2½ inch hose at the farthest point in the fire lines. The use of water in oil fires is simply to keep surrounding apparatus and tanks, buildings, etc. cool during the progress of a fire to prevent insofar as this means will, the widening of the fire area.

Railway Trackage and Wharf Facilities

The amount of trackage required at a refinery varies considerably and depends on the percentage of the crude and finished products that will be moved by rail, as well as the amount of tank car storage space desired for seasonal variations in the movement of finished products. A rough figure of trackage requirements is about a half mile per 1000 barrels of crude daily, but for plants located on water it will be very much less than this.

Tank cars for use in the transportation of oil are built in accordance with the American Railway Association's specifications for carrying inflammable liquids, whose vapour pressure does not exceed 10 gauge at 100° F. If however casinghead naphtha is to be moved, Class IV tank cars must be used.

Wharfage facilities for plants erected on navigable waters, are, as far as possible, pile structures with deep water face, approximately 400 feet long and arranged for a boat draft of 20 feet in fresh waters and 30 feet at low tide in sea waters.

The deck loading is figured at about 400 pounds per square foot. For certain sea locations, particularly in South America loading and discharge of steamers is done through undersea lines, which sometimes are laid a mile out before sufficient depth of water for boat draft is reached. The end of the pipe line is either a hose supported on an anchored float or a small deck protected by pile dolphins. Such lines have a life of about four years.

Repair Shop Equipment

As mentioned previously, a very large part of the expense of refinery operation is due to the excessive repair work necessitated by the severe punishment that distilling and treating apparatus receives in service. On this account, mechanical shops, having carpenter, machine, boiler, blacksmith and pipe departments are a regular installation.

The customary equipment for the carpenter shop is a bandsaw and planer, and for pattern work a wood lathe is useful. The machine shop equipment preferably consists of two lathes, a planer, two drills, a tool grinder and bolt cutter, as well as the miscellaneous small tools, incidental to a well equipped machine shop. In the boiler shop, plate rolls to handle plates up to 16 feet wide are used, although some situations can be cared for by 12′ rolls. In addition, a power operated punch with at least a 36″ throat and fitted with a shearing device is a necessity, as well as a full complement of air drills, hammers, etc. The blacksmith shop should have a steam hammer, as well as the usual hand forges, etc. The pipe shop should be equipped with two pipe machines, one to cut and thread pipe from ½″ to 4″ and one to handle up to 16″ O.D. pipe, and in addition, the usual complement of hand tools for cutting and threading up to 4″ pipe should be available for use outside the shop.

Tank cars require regular repairs, and these together with the repairs incident to refining necessitate a storehouse of ample capacity, fully stocked with standard hardware and equipment specialties, as well as brick, lime, cement etc.

It is rather difficult in a paper of this kind to cover matters in as great detail as perhaps the importance of the subject justifies and in case any one is further interested in petroleum refining and wishes to rend an authentic publication, no better selection can be made at the present time than Bacon and Hamor's American Petroleum Industry.

The Place of the Laboratory in Standardization.

Types of engineering standards: measurement, constants, quality, performance, practice; work of the laboratory in determining standards, methods employed by the laboratories of the Hydro-Electric Power Commission of Ontario

W.P. Dobson, M.E.I.C.

Paper presented before Toronto Branch, The Engineering Institute of Canada, November 1921.

Standardization has been the subject of so much discussion during the past few years that an apology is an almost necessary introduction to a paper on this subject. Yet it is the hope of the writer that a description of the part played by a large operating organization in the preparation of standards of engineering and in their application to its work, may be of interest to *The Engineering Institute.* The part of the Hydro-Electric Power Commission of Ontario in this work, as will be brought out, lies chiefly in the application of these standards; their preparation is the co-operative work of many organizations- industrial, operating and regulating- in which work the Commission shares. The discussion approaches the subject from the point of view of the laboratory. An attempt will be made to establish the thesis that the laboratory is of fundamental importance in the preparation of engineering standards. Such examples as given are taken from the work of the Laboratories of the Hydro-Electric Power Commission.

In its broadest sense a standard is a model, example or authority with which comparison may be made. The application of a standard thus implies measurement and the value of standards in engineering is directly proportional to the degree to which they reduce comparison to quantitative measurement.

The standards of engineering may be grouped into five main classes:

1. Standards of measurement
2. Standard constants
3. Standards of quality
4. Standards of performance
5. Standards of practice.

Standards of measurement form the basis of all scientific and industrial research and of commercial intercourse. They are based upon arbitrary choice and include both fundamental and derived standards for expressing quantitatively the relations of space, time, energy, matter and motion. Among standard of measurement are included the units of length, mass, heat, light and electricity.

General View of High Tension Laboratory.

Standard constants are the numerical expressions of the fixed properties of matter or of the relations between the various forms of energy and matter and between physical quantities, the value of which it is necessary or useful to know. These are also of fundamental importance to science and industry and include such quantities as the mechanical equivalent of heat, viscosities, boiling and melting points, electrical conductivities of materials, etc.

Standards of quality usually take the form of specifications of the desired properties of a material in terms which

admit of measurement. The purpose of such standards is to provide a guide for the manufacturer in the production of material and thus to secure a high quality in the products of industry; and to serve as a scientific basis for purchasing by enabling the purchaser to specify the desired qualities of the material in definite terms and to make the necessary tests to determine its quality.

Standards of performance are specifications which may be applied to machines, instruments, or devices as standards of quality are applied to materials. To be of value they should specify the factors involved in terms susceptible of measurement. Specifications for electric generators, motors, transformers, weighing devices, steam engines, are standards of performance. To determine the performance of a machine requires the application of standards of measurement and standards of quality.

Standards of practice are the expression of scientific or technical requirements in the form of rules or laws. They involve such matters as the safety of property or persons, the relations between different corporations or between corporations and the public. Building codes and standards of electrical construction are examples of this class of standard.

Of the five classes of standards discussed above, the first, standards of measurement, includes those standards which are fundamental to science and industry, but which are purely arbitrary. The second class, standard constants, embraces fixed quantitative relations expressed in terms of standards of measurement. The preparation of these standards does not come within the province of an operating organization but is the function of national standardizing laboratories and scientific research workers. Certain standards of measurement are, however, maintained by most operating organizations; these may be called secondary or working standards as contrasted with the primary standards maintained by the national laboratories. The Hydro-Electric Power Commission maintains standards of electrical measurement and of photometry in the form of precision resistances, standard cells and incandescent lamps. These are instruments of high quality which have been compared with the fundamental standards of resistance, current and candle power maintained by the Bureau of Standards of the United States, and their characteristic properties determined to a high degree of accuracy. They are used to maintain the accuracy of the laboratory measuring instruments, and thus form the basis of all the work of the laboratory and of the standardization work of the Commission.

The determination of standard constants is also without the province of our laboratories.

The standards with which the operating organizations such as the Hydro Electric Power Commission are chiefly concerned are those of quality, performance and practice. The Laboratories are engaged in co-operation with other departments of the Commission in the preparation of such standards and in their application to the work of the Commission.

The preparation of standards of any kind involves a clear understanding of the requirements of the service to which the standard may be applied. These requirements must be stated in terms susceptible of measurement. A standard of engineering involves such questions as the properties of materials, the efficiency of apparatus, the safety of property or persons and the legal rights of corporations and individuals.

Short Circuit Test on 13,000 Volt Fuses.

The purpose of a specification may be defeated by setting the standard too low or too high. Too low a standard will cause waste and poor efficiency; too high a standard may have the same results. A careful study of the economics of each case should be made before setting a standard of quality, performance or practice. For example, in the design of a transmission system, the insulation of the transmission line should be so related to the insulation of the terminal apparatus that safety will be obtained at the minimum of cost. Too low a value of flashover voltage would result in frequent interruptions and line repairs; on the other hand, too high a value would increase the cost of the line and would impose an additional hazard on the system in that it would transfer the burden of defence against the attacks of excess voltage and of destructive surges of the terminal equipment, the failure of which would be more serious than in insulator failure and more difficult and costly to repair. As a further example, consider the specification of the efficiency of a transformer or of its exciting current. An increase in efficiency or a decrease in exciting current will increase the cost. It must be determined by the purchaser how much he can afford to pay for these improvements. In other words, he must balance the saving in cable, bus bars, switches, etc, resulting from the higher standards against the additional cost of the higher standards.

The preparation of standards of engineering, especially those of quality, performance and practice, can be satisfactory accomplished only by co-operation among the interested parties. The preparation of standards of practice is usually the work of governmental bodies who prepare the standards in co-operation with those organizations interested in and affected by the regulations; the standards are then promulgated as rules or codes. Standards of quality and performance are the peculiar interest of engineering and operating organizations. The work of preparing such standards has heretofore devolved largely upon the professional engineering bodies. In the United States there is also an organization whose exclusive function is the preparation of Standards, the American

Society for Testing Materials. The work of standardization has received a great impetus recently in the formation of national engineering standards associations. The co-operation of these national bodies has in reality formed an international standardizing association, the importance of which will grow rapidly and have an enormous influence on future engineering pratice in all countries.

The Hydro Electric Power Commission is represented on committees of the various standardizing organizations and the Laboratories are co-operating in the investigational work of these committees.

B—Resistance coils wound over insulation to determine temperature at various points.
Thermal conductivity calculated from readings.

Standards of Quality

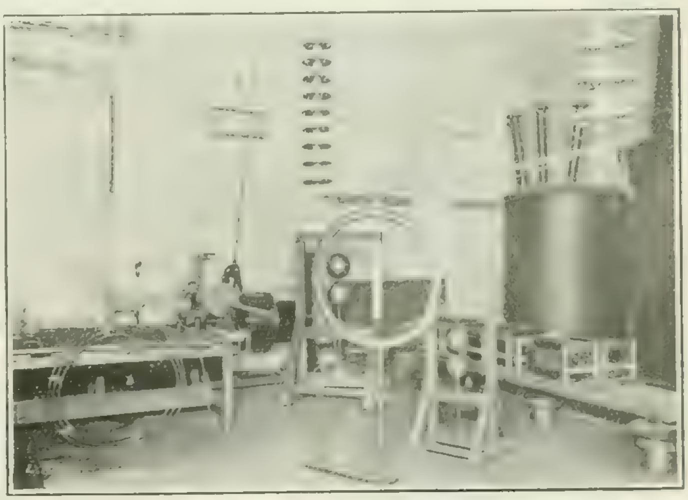
The need for standards arises whenever it is desired to purchase material intelligently, to effect economies in the construction of large works, or to operate such efficiently. The beginning of any standard is in the laboratory because it is almost always necessary to know the properties of a material before a standard of quality or even of performance and practice can be prepared, and a knowledge of the properties ofmaterials can only be obtained by investigation. The preparation of a standard is a process of evolution; let us take for example a standard of quality - insulating varnishes for electrical work. The desired properties are first determined. The varnish must resist the passage of electricity, that is, it must possess dielectric strength. It must have elasticity and flexibility under the temperature conditions to which it will be subjected. It must be moisture-resisting, oil-proof; and must not contain acid which would be injurious to the conductor or material to which the varnish is applied. These qualities are all necessary, but in order that a standard may be definite the properties must be stated in terms which admit of measurement. The first attempt at comparing varnishes under specification would probably be an estimate of the relative standing of the several samples submitted, with respect to these desired qualities. As experience was obtained in the use of the varnishes it would be possible to set suitable values for dielectric strength, oil proofness etc. and a definite standard would finally be evolved.

The work of the Laboratories respecting standards of quality covers practically the entire field of engineering materials. When standards exist the task of comparing any number of materials or of determining the quality of a single sample submitted is comparatively easy. It involves merely chemical or physical measurement. But for many materials no standards are available and it is then necessary to prepare tentative standards. It is usually possible to make comparison between two or more samples of a material with respect to any desired quality even though definite standards be not available.

The gradual accumulation of data from such tests lays the foundation for definite standards of quality. The work of the Laboratories in this connection has included such materials as transformer oil, tapes and cambric for electrical insulation, insulating varnish and moulded insulating material for electrical purposes, Portland cement, lubricating oils, gasoline, paints, protective coatings, metals for various structural uses, etc. The task of the Laboratories in the preparation of standards for such materials is twofold: first, to determine what values to assign to the desired properties; second, to devise methods of test by which the properties may be measured.

Methods of test are fundamental in the application of specifications and may have an important effect upon the value of the results of any comparison between competitive materials. In developing methods of testing it is also necessary, in many cases to devise testing instruments and apparatus; the results obtained often depend to a great extent upon the testing apparatus employed. An example will serve to illustrate this point.

The dielectric strength of insulating material such as oil or thin sheet insulation is determined by applying



High Frequency Test on Transformer Coil.

voltage to the material placed between electrodes. The values of breakdown voltage depend upon the shape of the electrodes and their size, as well as upon the time of

application of the voltage; it is then necessary that the required dielectric strength be specified in relation to the apparatus used to determine it. In the case of transformer oil three different devices have been developed to determine dielectric strength and confusion often arises in the interpretation of results when the method of test is not stated. The device used by the Laboratories consists of two discs 1 inch diameter spaced 0.1 inch apart on a horizontal axis. In the case of thin sheet insulation no standards have as yet been universally adopted; for the purpose of comparison the Laboratories has adopted a particular form of electrode and rate of application of voltage.

Standards of Performance

The work in connection with standards of performance is the counterpart with respect to apparatus, of the work in connection with standards of quality. The function of the laboratory is advisory to the engineering, purchasing and operating departments. The greater part of this work consists in efficiency tests on electrical machinery after installation and in tests on incandescent lamps. Assistance has also been given to the engineering and purchasing departments in the preparation of specifications for these classes of apparatus. In the preparation of specifications for high tension transformers, the necessity arose to specify the dielectric strength of the end turns nearest the line side, it being evident that these turns must be more heavily insulated then the interior turns. Such a test must be made at a very high frequency, as it is manifestly impossible to build up sufficient voltage at low frequency across the low impedance of the few turns of the end coil. After considerable investigation an oscillating circuit was built up which supplied sufficient energy at a frequency of approximately 300,000 cycles to accomplish the test and to enable us to set a reasonable value for the required dielectric strength of the end coils of the transformers. Considerable work has also been done in preparing specifications for incandescent lamps. This has included compilation of data regarding lamp performance; investigation of the effect of various operating conditions upon life; economic studies to determine the most suitable efficiencies and life under conditions of power cost in Ontario.

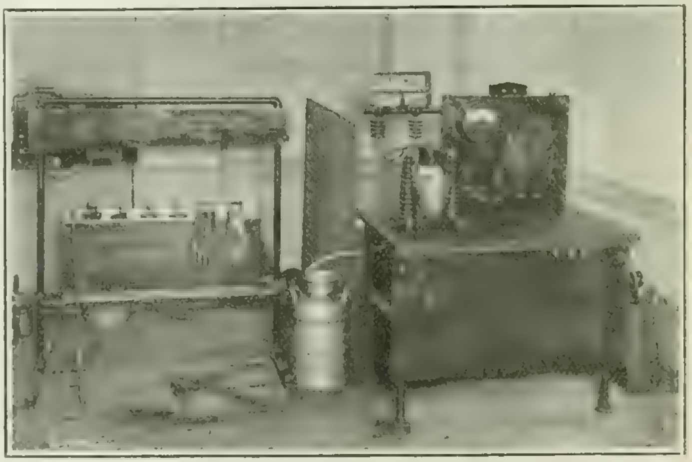
Standards of Practice

The standards of practice with which the Commission is concerned are of two kinds:

1. Standards governing practice in conctruction or operation of its systems.
2. Standards which it is obliged to enforce by reason of legislation

Among the first class are included all standards of construction and of operating routine. Those with which the Laboratories have a certain responsibility are concrete materials and linemen's rubber gloves.

Standard instructions for the handling of concrete materials have been prepared by a committee on which the Laboratories are represented and it is the duty of the Laboratories to act in an advisory capacity to the engineering and construction departments in carrying out these instructions. These instructions provided for the selection of suitable sources of materials for any concrete construction job; this is the duty of the Laboratories. From tests on these materials at the Laboratories the proportioning to yield the desired strength of concrete is determined. On jobs of sufficient size to warrant the expense, a field laboratory is installed and a continuous check upon the quality of concrete is maintained. The proportioning is varied as rendered necessary by changes in the quality of the materials; test samples are taken periodically from the mixer, stored for 28 days and tested for compression. In this way it is possible to determine whether the desired strength in the concrete structure is being obtained. Considerable research work has been conducted by the Laboratories in connection with methods of proportioning and a method has been evolved and tried out on several large jobs which renders possible important economies in the use of cement. The results of these researches have been given in several publications in the technical press. These articles have also been printed by the Commission and are available to those interested. The value of the standard of practice just described is not confined to economy in the use of cement. It furnishes the designing engineers with knowledge of the strength of the structure. Without this knowledge they would be forced to a more conservative design calling for higher strength in many cases than necessary.

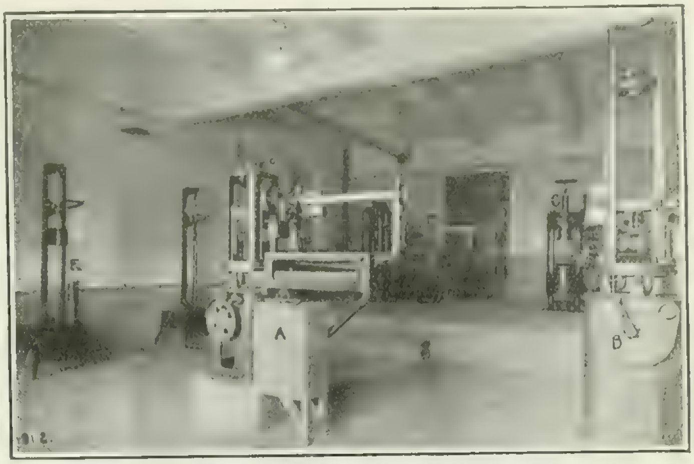


60,000 Volt Test Set for Testing Transformer Oil, Rubber Gloves, etc.

The standard for rubber gloves and its application is the function of the accident prevention department. All gloves are purchased under strict specifications as to plysical and electrical properties and stored in the Laboratories. Before being sent out to the field each glove is given a dielectric test of 10,000 volts and all good gloves are sealed in special envelopes indicating that the gloves have been tested. Each month all gloves are returned to the Laboratories for re-test. They are given a minute inspection for mechanical defects and a dielectric test of 10,000 volts. Every percaution is thus taken to insure againts accident to employees working on live lines. In connection with the preparation of this standard many tests have been made on the physical properties of the material entering into the gloves and methods of test have been developed to determine these properties.

The second class of standards of practice relates to the enforcement of the proviions of the Electrical Inspection Act. There are two distinct standards, one relating to the installation of wiring and electrical equipment in or upon buildings, the other to the design and construction of electrical material, devices and fittings for use in such installations. The first standard thus has to do with methods of installation, the second with the quality of the material or devices installed. The application of this latter standard is the function of the Laboratories.

The law requires that all electrical material, devices and fittings for use as specified in the preceding paragraph be approved by the Commission before being offered for sale or used in the province of Ontario. The object of this regulation is to eliminate as far as possible, fire and accident hazard from electrical apparatus and appliances, and thus protect the public from loss or danger incident to the use of electricity by reason of defective construction The work of the Laboratories consists in testing and inspecting all such material, devices and fittings, and in maintaining lists of approved material. A routine procedure has been adopted under which manufacturers submit samples of their product to the Laboratories where they are examined and tested in accordance with standardized methods as set forth in the specifications. When a device has been found to agree with the specifications it is formally approved by the Commission and may be so marked by the manufacturer. The Commission issues a list of approved devices and conducts an inspection service in order to be assured that approved devices are kept continously up to standard by the manufacturers. The preparation of specifications for the test and construction of electrical material, devices and fittings is a necessary part of this work, which is carried on in co-operation with the electrical inspection department of the Commission, the electrical contractors, manufacturers and jobbers, and the fire underwriters.



Testing machines in Structural Laboratory.

Many standards are in use by the Commission which are not mentioned in this paper. As indicated in the introduction the aim has been to describe the place of the laboratory in the work of standardization and such examples as are given were chosen with this aim in view. Standards to be of value must be continuously revised to keep pace with advances in industry. This implies improvements in methods of test and in testing instruments as well as revision of the requirements of use, and this in turn, implies investigation. The principal contribution of the laboratory to the work of standardization is the substitution of exact knowledge for judgment, which latter even when experienced can be but a poor substitute for the former. It would thus appear that the laboratory has an important place in the work of standardization.

The Aeroplane Engine

The requirements of aircraft propulsion and their effect on engine design.

P. E. Biggar, S. E. I. C.

Paper presented before the Montreal Branch, The Engineering Institute of Canada, November 3rd, 1921.

Man has always been keenly attracted by the air. Throughout the ages, he has been willing to risk, and too often sacrifice, his life in his efforts to explore this alluring element. He speaks of the lowly mortal as "of the earth, earthy" and depicts the heavenly being as an angel with wings. Even the sophisticated man of to-day feels this spell and cannot resist the temptation to gaze at the chance aeroplane overhead.

Probably this attraction is principally due to the very invisibility of the air. The intangible always possesses a psychological fascination. Then, there is the possibility of attaining very high speeds which already exceed those reached by any other mode of transportation. In flight, one leaves behind the restrictions of the earth and may travel by the shortest route and manoeuvre in three dimensions.

For many centuries, the conquest of the air remained but a dream. Nature's great barrier to flight, gravitation, proved insurmountable, until the wonderful development of the internal combustion engine, in the hands of Daimler, Benz and others, made available a power plant which would, in some measures at least, fulfil the exacting requirements of aerial use.

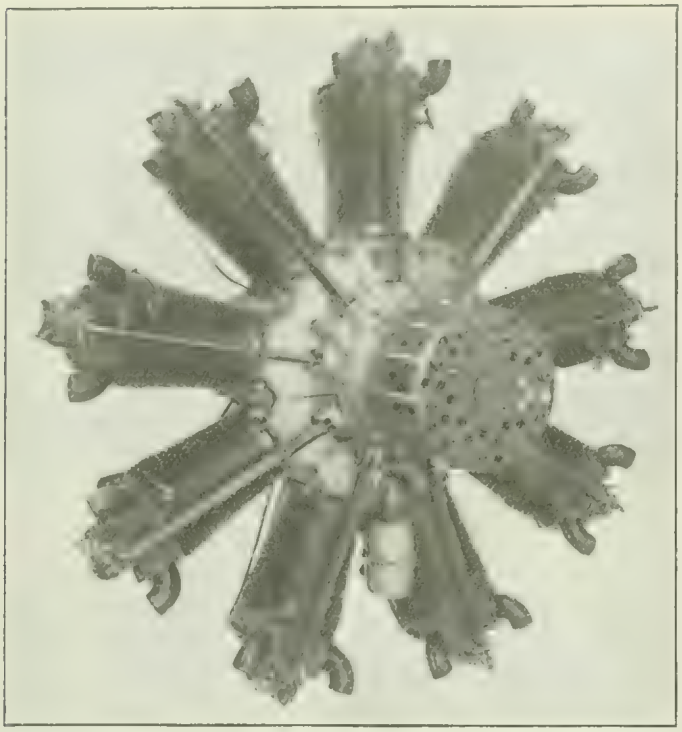


Fig. 1 The 450 H.P. Bristol "Jupiter".

Flight, like all man's greatest achievements, depended upon the evolution of a suitable prime mover. The standard of performance is so high and the conditions of operation so severe, that the aero engine will always be the finest of mechanisms. The only motor which has proved suitable for use in the air is the internal combustion engine of the four cycle, low-compression type, which is so widely known through its use for automotive propulsion.

The Requirements of the Aero Engine

Let us consider the factors which have governed the development of the aero engine. The following may be said to be the specifications of an engine suitable for use in the air, in order of their importance.

(1) The aero engine must be reliable.

(2) It must be as light as possible.

(3) It must be economical in its consumption of fuel and oil.

(4) Its head resistance, when installed in the plane, must be as low as possible.

(5) It must have a satisfactory degree of uniformity of torque and freedom from vibration.

(6) For use in war, it should be concentrated.

(7) For commercial use, it should be low in first cost and durable in service.

Reliability.

The first factor, reliability, is of very great importance. Apart from financial considerations, the whole future of commercial aviation depends upon the degree to which engine failure can be eliminated. In land or water transportation, a failure of the motive power will result in a delay of a few hours at most, but with flying, the plane, no longer able to keep to the air, must glide to a landing. The passengers will be delayed indefinitely and, if the plane is forced down over unsuitable country, run the risk of personal injury.

Reliability is of even greater importance to fighting craft. The efficiency of a squadron is measured by the number of hours of useful flying carried out per machine per day. Planes which are unfit to take the air demand the attention of the mechanics, night and day, until they are made serviceable and, during moving warfare, must often be abandoned, just when their potential value is greatest. Should the engine fail when over the lines, the pilot is unable to carry out his duties and becomes an added responsibility to his companions.

How, then, is reliability to be ensured? Firstly, the materials must be carefully chosen. During the war, great advances were made in the quality and treatment of the steels used in aero engines and 100 ton steel is now employed for the more highly stressed parts. Then the design must be worked out with great care. Success is only attained by a nice blending of the science of accurate calculation and the art of wide experience. To meet the requirements of use in the air, the stresses and load factors are somewhat higher than those used in stationary engine design and good judgement is necessary in deciding limiting values. Troublesome parts are duplicated, as far as possible. When the engine is completed, it is given a very severe running test on the bench, is then dissembled and inspected and any faulty parts are replaced.

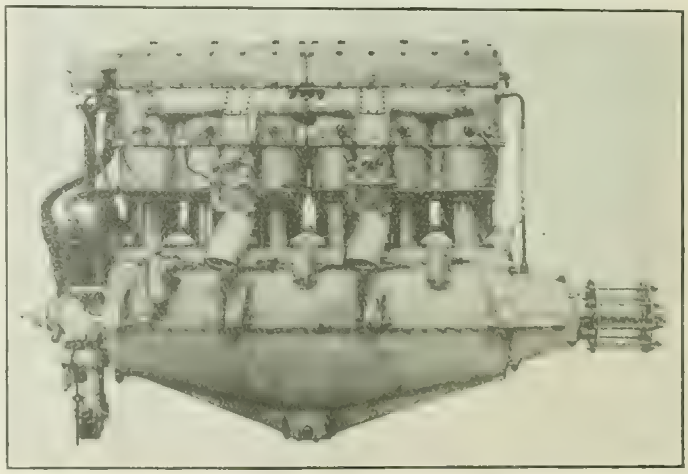

Fig. 2 The 240 H. P. Siddeley "Puma"

This care is wasted if the engine is carelessly handled in service. Before each flight the engine must be gradually warmed up, by running it quite slowly. The pilot must see that the oil pressure and the gasoline supply pressure are maintained at the correct point and, when the cooling water has reached the normal temperature, the throttle is gradually opened until the full rate of revolution is indicated. The condition of the engine is judged from the feel of the compression, when it is cranked over, by the sound of the exhaust and by the rate at which it is able to drive the propeller.

The mechanic is largely responsible for the service of his engine. Each night, the spark plugs must be cleaned and adjusted, the distributors wiped off and all gasoline and oil filters carefully cleaned. The entire engine is inspected for any indication of incipient trouble. After about one hundred flying hours, a stationary engine is given a "top overhaul". The cylinders are removed, the carbon cleaned out, the valves ground into place and all parts inspected. After about two hundred hours, the engine is removed from the plane and given a complete overhaul. In the case of a rotary engine, the top overhaul is carried out after thirty-five and seventy hours and the complete overhaul after one hundred hours flying.

Engine Weight.

The effect of engine weight on the load which the plane can carry is fairly obvious. Every pound added to the powerplant is just one pound less 'available lift'. The weight of the engine reacts on the strength of the bearers and internal bracing needed to carry it in the fuselage and on the extent of plane area and external bracing necessary to take it into the air. An aeroplane fitted with a heavy engine thus presents what the political economist would call a "vicious circle".

This was the great difficulty of the early aviators. Their flights were not of sufficient duration to demand a very high degree of reliability, but it was essential that the engine should develop sufficient power to lift itself and some hundreds of pounds of aeroplane off the ground. This factor was the dominating one in all the early engines. Langley was anxious to try an internal combustion engine in his "Aerodrome" and, as no manufacturer would undertake to produce a model of the extremely low weight required, he designed and built his own. It had five steel cylinders arranged radially about a common crankcase and developed 52 brakehorse power, for a dry weight of only 115 pounds. This type of engine received a great deal of attention during the later stages of the war. Fig 1 shows the Bristol "Jupiter", one of the finest radials of to-day.

The engine used by the Wright brothers was of the four cylinder vertical type. Though quite heavy, it developed but 24 horsepower. In response to a demand for greater power outputs, the six cylinder vertical was produced. Fig. 2 shows the Armstrong-Siddeley "Puma" which was designed during the war. Later on, in order to permit the development of more power without unduly increasing the length of the engine, the V, or diagonal type was evolved and has been brought to a high degree of refinement. Fig. 4 shows the Rolls-Royce "Eagle VIII", so well known for its wonderful performance in the trans-Atlantic and London-Australia flights. Of recent years, the number of banks of cylinders has been increased to three and even four. Fig. 5 shows the Napier "Lion", an extremely successful twelve cylinder engine. Fig. 7 shows the Napier "Cub" which was built for the Air Ministry. Full particulars are not available, but this engine is stated to have developed 1057 B.H.P. in its sixteen cylinders.

A few years after the first flight, the Gnôme rotary engine made its appearance. In this type, the crankshaft is held stationary and the cylinders, which are arranged radially, revolve en masse. In spite of its rather startling design, the engine showed a remarkable weight efficiency and enabled planes to fly which had never been able to lift their heavy powerplants from the ground. As the centrifugal stresses are somewhat severe, the entire engine is usually constructed of forged steel. Fig. 8 shows one of the more recent developments of this type.

The weight efficiencies of some of the engines in use to-day are given in table I. It is interesting to note that the weight of stationary engines varies from about 150 to 500 Lbs./B.H.P., though 30 Lbs./B.H.P. is attained in special types, such as submarine Diesels.

Table I.

Make and Model	Number of Cylinders	B.H.P.	Type	Bore and Stroke Inches.	Weight Lbs/B.H.P.	Fuel and Oil Lbs/BHP/Hour
Beardmore	6	160	Vertical	5.7 x 6.9	4.0	0.55
Bentley BR-2	9	220	Rotary	5.5 x 7.1	2.25	0.70
Bayern or B.M.W.	6	185	Vertical	5.9 x 7.1	3.15	0.46
Bristol "Jupiter"	9	450	Radial	5.7 x 7.5	1.74	0.61
Clerget BF	9	130	Rotary	4.7 x 6.7	2.70	1.00
Fiat A-14	12	700	V	6.7 x 8.2	2.30	0.53
Hispano-Suiza "Viper"	8	180	V	4.7 x 5.2	2.34	0.52
Hispano-Suiza H-2	8	300	V	5.5 x 5.9	2.00	0.54
Liberty	12	400	V	5.0 x 7.0	2.67	0.57
Maybach	6	260	Vertical	6.5 x 7.1	3.10	0.51
Napier "Lion"	12	450	Bd. Arrow	5.5 x 5.1	1.98	0.51
Napier "Cub"	16	1050	X	(?)	2.01	(?)
Rolls-Royce "Eagle VIII"	12	360	V	4.5 x 6.5	2.5	0.52
Siddeley "Puma" or B.H.P	6	240	Vertical	5.7 x 7.5	2.65	0.55

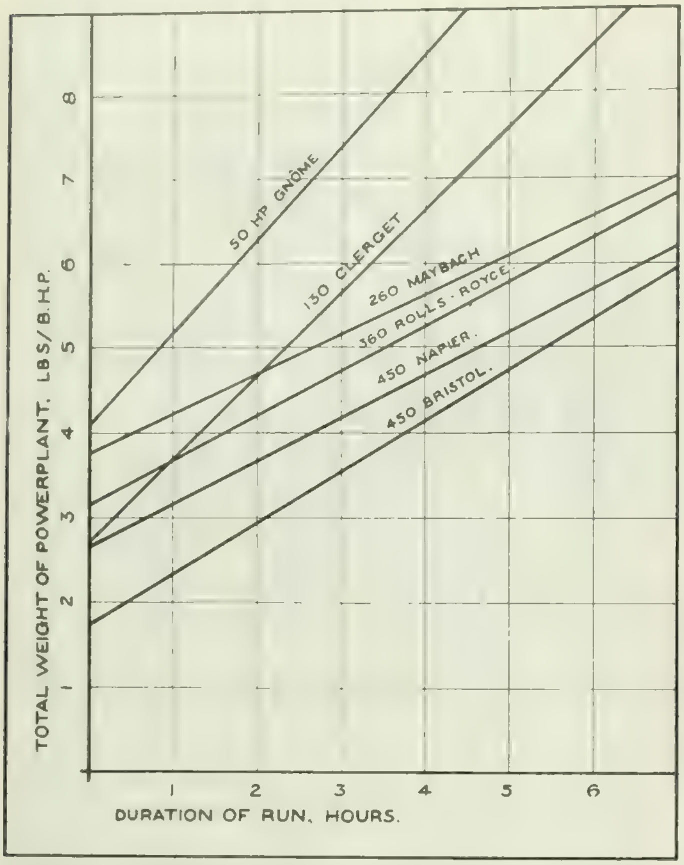

Fig. 3 The Relation of Fuel Consumption to Total Weight.

Consumption of Fuel and Oil.

The factor of fuel consumption is very closely related to that of weight efficiency. It is useless to produce an engine of low dry weight, if, by an abnormal consumption of fuel and oil, the total weight when ready for a few hours run may be bettered by a heavier but more economical rival. Fig. 3 will show this point. The starting point of the curve for any particular engine is determined by its dry weight in lbs./B.H.P. and the slope by its fuel consumption in lbs./B.H.P./hour. It appears that, for a flight of two hours or more, it would be better to use any of the stationary engines shown than to use the 130 H.P. Clerget rotary. In the case of the Napier "Lion", the fuel and oil for a run of six hours will weigh more than the entire powerplant.

With the airship, of which the only promise of commercial utility lies in its ability to remain in the air for long periods and to carry out extended cruises, the factor of fuel consumption is of even greater importance. Considering the case of the 260 H.P. Maybach, which was used in the Zeppelins and in the ill-fated British "ZR-2", we have the following figures,

Weight of powerplant in running order, less fuel and oil	1102.0 lbs.
Weight of fuel per hour	139.0 lbs.
Weight of oil per hour	12.36 lbs.
Weight of fuel and oil per hour	151.36 lbs.

The fuel and oil for a flight of fifty hours, such as a voyage from London to New York, would thus be 7568 lbs., or nearly seven times the weight of the powerplant. This would be modified by the degree to which the engines could be run throttled down, but the figures will serve to bring out the great extent to which total weight is governed by fuel consumption.

Fuel is a costly item of expense. Figures based on the operation of aerial routes in Europe show that the fuel bill constitutes from 29% to 54% of the total cost of operation, depending on the type of machine. American figures show as much as 28% for this item. In the operation of bombing planes, it was usual to place a calculated amount of fuel in the tanks and to use the remainder of the lift for bombs. On the way over, the planes requires careful protection, but, on the return journey, with bombs and half the fuel gone, the bombing machines could easily take care of themselves and, in fact, had an unpleasant custom of leaving their fighting escort far behind, to settle with the Huns.

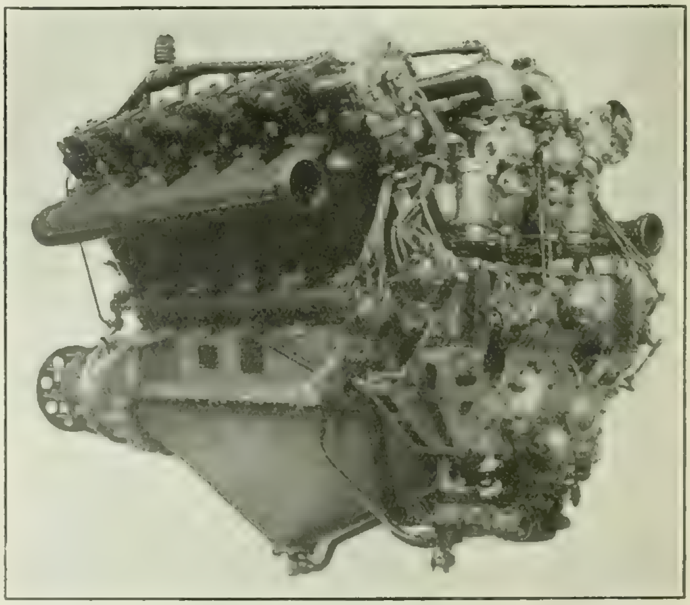

Fig. 4 The 360 H. P. Rolls-Royce "Eagle VIII".

The effort to economize fuel gains added importance from the ever increasing inadequacy of the supply of crude oil. We are forced to seek a more economical use of the gasoline of to-day and to consider a less attractive use of the indigestible fuels of to-morrow. Because of its high thermal efficiency and its ability to burn the heavier oils, the Diesel may yet be used in the air. It would settle our difficulties of carburetion, distribution and ignition, though at the expense of a rather delicate fuel injection system, and the fire risk would be almost eliminated. Experimental engines have been built, but their weight is rather greater that that of the low compression type.

Head Resistance

Since the engine is never left exposed to the air, this factor is really measured by the limitations it imposes

upon the shape of the nose of the fuselage. To this must be added a charge for the "drag" of those parts which are allowed to project from the cowling. In all the latest racing machines and many of the fighting craft, the fuselage is of a very efficient "streamline" shape and the tops of the cylinders are allowed to project a few inches. Some types of engine lend themselves very readily to this treatment. All the water-cooled stationaries may be cowled in very neatly, though their radiators offer a very noticeable resistance to the air. The rotary requires an almost flat nose about four feet in diameter and the radial must have all its cylinders exposed to the air, for effective cooling.

The engine must nearly always be mounted so that it is directly in the path of the air blown back by the propeller and this slip-stream has a velocity somewhat in excess of the air speed of the plane. When we consider that the power required to lift the plane varies almost directly as the speed, while that required to overcome inactive resistances varies nearly with the cube of the speed, one realizes the necessity of keeping this "drag" as small as possible.

Torque and Balance.

The factors of torque and balance cannot be discussed in exact terms. The range of each encountered in practice is surprisingly great. There has been a distinct tendency to increase the number of cylinders used and this may be ascribed to the difficulty of obtaining a very high power from each cylinder. Mechanical and thermal problems arise which are not easy of solution. The largest cylinders used are those of the Ricardo engine which are 8x11 inches and develop 120 B.H.P. Twenty-four cylinder engines have been designed, but the sixteen cylinder Napier "Cub" is the largest yet produced.

Probably an engine of less than six cylinders suffers to some extent from fluctuations in propeller velocity. Gearing is frequently employed to improve the propeller efficiency without a sacrifice of engine power which would arise from a reduced r.p.m. It is difficult to obtain satisfactory service from gearing, if driven by less than twelve cylinders, owing to fluctuations in torque. Flywheels are very seldom used in aero engines, owing to their weight.

With regard to balance, it may be pointed out that, as the engine and its mounting must be very light in weight, any unbalanced forces will cause an unpleasantly marked vibration. The balance characteristics of most of the stationary types are well known, but it may be mentioned that the four has a resultant secondary force acting in a vertical direction, the eight combines the forces of its banks of cylinders so that the resultant is horizontal and the six and its multiples have no resultant forces. The radials have rather large resultant primary forces, which are easily balanced by counterweights, except in the three cylinder radial. The rotary type has perfect balance.

It should be clearly understood that inherent balance may easily be spoiled by careless assembly. Reciprocating parts are always weighed and matched when the engine is built, but this arrangement may be altered during overhaul. In the case of the rotary, if one ounce is left unbalanced at the cylinder head, a centrifugal force of nearly fifty pounds will be exerted, at normal revolutions.

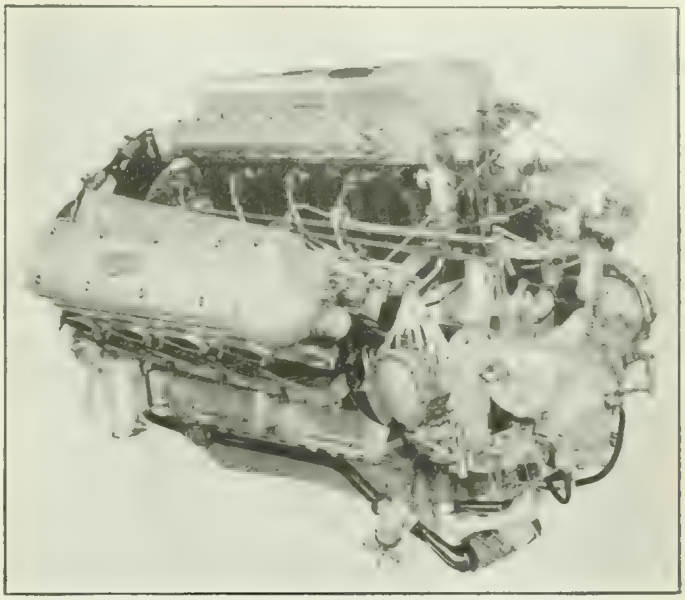

Fig. 5 The 450 H. P. Napier "Lion."

For this reason, the rotating parts should always be balanced on a pair of horizontal knife edges.

Torsional vibration in the crankshaft is often rather difficult to overcome. The Germans met this effect, which we may describe as rotary whipping, by the use of very heavy crankshafts. That of the 260 H.P. Mercedes, for instance, weighs 140 lbs. Even this rather questionable cure seems to have failed in the eight cylinder in line type of Mercedes. In the later British engines, the Lanchester anti-vibrator was used with very good results. Briefly, this consists of a very small flywheel, which is mounted on the end of the crankshaft opposite to the propeller and is driven through a friction clutch. This slips slightly, backwards and forwards, in response to the rotary accelerations of the end of the shaft and exerts a very marked damping effect.

Concentration

The factor of concentration is only of importance for engines used in fighting craft, where rapid manoeuvring is essential. If a rotary or a radial is used, the pilot may be placed immediately in rear of the engine and a very close-coupled arrangement results. The longitudinal moment of inertia is reduced and the machine responds very readily to the controls. This is of great value in a "dog fight" which may best be described as planes flying "madly in all directions". It may perhaps be considered that the gyroscopic effects of the rotary would render it unsuited for this use, but, in practice, these are so slight as to cause no noticeable inconvenience to the pilot.

Cost And Durability

These factors only enter into the commercial use of aircraft, since, in war everything must be sacrificed for effect. By careful design and a slight loss of weight efficiency, the engine may be constructed of cheaper materials and with more durable wearing parts. A commercial engine may weigh as much as 3½ lbs./B.H.P. and

should be able to run for 150 hours between overhauls. Accessibility of design and installation is most important. Inaccessible parts are nearly always neglected and the time of overhaul may be much reduced by careful attention to these details. In one of the latest English machines, the entire powerplant, less the fuel tanks, may be removed by loosening four bolts, after disconnecting the fuel lines and the controls.

Nearly all the current work on aero engines has been the re-designing and improvement of war-time models. In many cases, these were brought out in the shortest possible time with the result that many imperfections were introduced which nothing but the experience of hard service could bring to light. In England, the experimental work has largely been directed towards the development of the maximum power from a given cylinder.

Maximum Development of Power

In considering the possibility of improving the power output of a given engine, let us first examine the theoretical aspects of the case. For the comparison of thermal efficiency in internal combustion engines, there has been set up the "Air Standard". Assuming a perfect engine and that the specific heat of the working fluid is a constant quantity, thermodynamic reasoning will deduce the equation, $E = 1-(\frac{1}{r})^{\frac{C_p}{C_v}-1}$. In the Air Standard, the value of gamma, the ratio of the specific heats, is taken as 1.4 and, using this, we may plot the upper curve in Fig. 6, for practical values of $\frac{1}{r}$, the compression ratio.

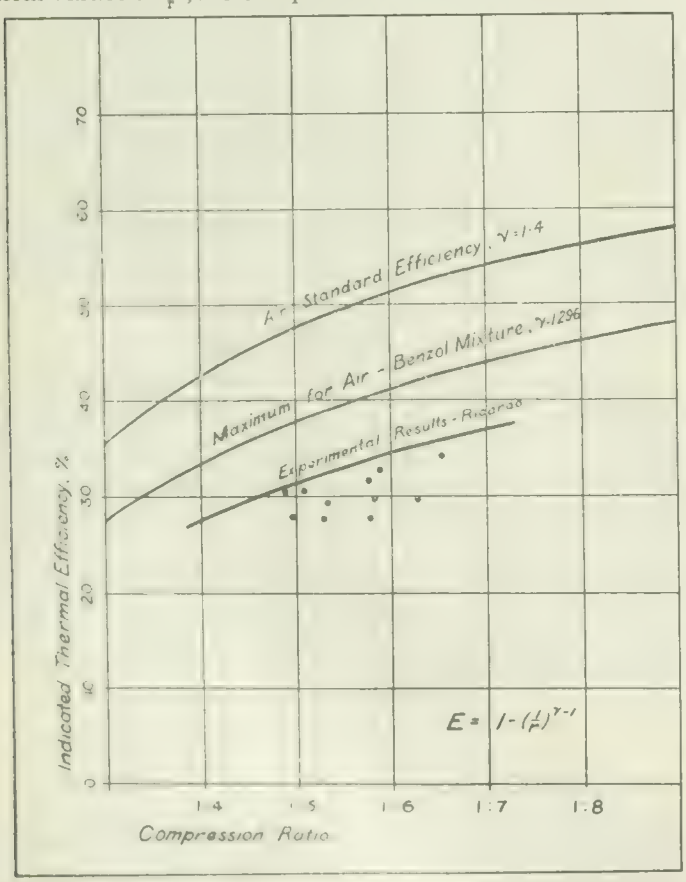

Fig. 6 The Relation of Thermal Efficiency to Compression Ratio.

Specific heat is, however, not a constant quantity. According to Ricardo, the value of gamma for the products of the combustion of a mixture of gasoline or of benzol and air is more correctly 1.296. Using this value in the above equation, we may plot the second curve. The engine is by no means thermodynamically perfect and best practical efficiencies fall lower still. Results obtained by Ricardo in a series of experiments on a variable compression engine are shown in the lower curve. The space between this and the second curve represents the heat losses of the engine. The indicated thermal efficiencies of a number of modern aero engines are indicated by dots. The scope for improvement would appear to be rather small.

High compression is plainly desirable. The possible thermal efficiency becomes greater and the performance at height is improved by the use of high compression ratios. Their great disadvantage is that they invariably bring pre-ignition and fuel knock, more often known as "detonation". This phenomenon has caused a great deal of trouble and, if allowed to persist, is capable of ruining the engine in a few hours. A compression ratio of 4.85 to 1 may be used with gasoline fuel, up to 7.05 to 1 with a fuel of high aromatic content, but, beyond this point, direct injection must be used.

The compression ratio is now frequently carried so high that the engine cannot be run "full out" near the ground. Its performance at height is much improved, but, until this designed height is attained, it must be throttled, or, better still, the closing of the inlet valve so delayed as to shorten the compression stroke. The density of the air has a direct bearing on the mass of the charge inspired during the inlet stroke and, since nearly all war flying is carried out at over 15,000 ft., at which altitude the power is about half that available at ground level, the maintainance of output is an important problem. The present altitude record of about 40,000 ft. was made by a plane equipped with a system of forced induction. Air was supplied to the carbureters by a blower driven by an exhaust turbine and the inlet pressure maintained equal to that of ground level up to about 24,000 ft.

Minimum Loss of Power

Let us now examine the mechanical side of the question. It remains to obtain the maximum efficiency in those points which thermodynamic reasoning assumes to be perfect. Consideration of the familiar "PLAN" formula, indicates that the requirements are as follows,–

(1) The development of maximum brake mean effective pressure which depends on,-

(A) The mean effective pressure and, for a given compression ratio, this is based on,-

(a) Maximum volumetric efficiency. This is a matter of careful design of the inlet tract and accurate valve timing.

(b) Correct and complete ignition, requiring an accurate mixture ratio, especially at full load.-

(c) Minimum heat and pressure losses - quantities which present little scope for improvement.

(B) The reduction of mechanical losses, which is a matter of careful design and effective lubrication.

(2) The attainment of maximum r.p.m., without serious loss of B.M.E.P. This figure reaches 2,100 r.p.m. in modern engines and shows continued improvement.

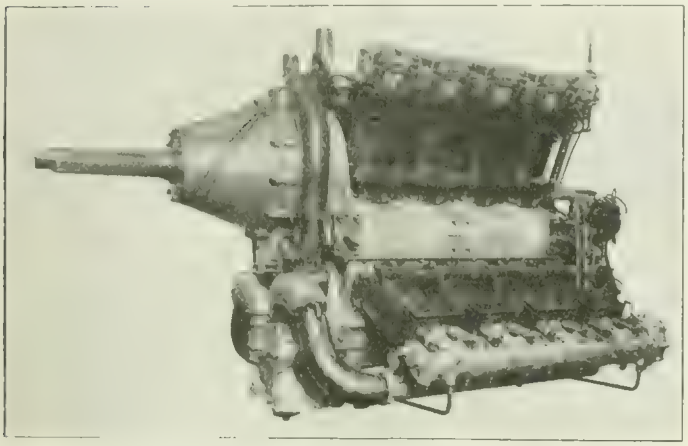

Fig. 7 The 1050 H.P. Napier " Cub ".

The extent of the mechanical losses in a modern aero engine is indicated by the following figures. They refer to the 260 H.P. Mercedes and are expressed in pounds per square inch of piston area.

(a) Piston friction	7.85 lbs./sq.in.
(b) Bearings, valve gear and auxiliaries	2.50 "
(c) Pumping losses	4.50 "
Total losses	14.85 lbs./sq.in.
Brake M.E.P.	107.50 "
Indicated M.E.P.	122.35 lbs./sq.in.
Mechanical efficiency	$107.5 \div 122.35 = 87.9\%$

In the case of the rotary type, it is necessary to add a windage loss of about 15% of the output. This represents the power required to revolve the cylinders against the resistance of the air.

The Development of the Aero Engine.

We have laid down seven requirements which govern the characteristics of an aeroplane engine. We have shown how these have affected its development and have indicated the limitations of present day design. There is one point which the engineer may well bear in mind. During the eighteen years which man has been able to respond to the lure of the air, there has been no change in any fundamental point of aero engine design or operation. The wonderful development of the science of aeronautics is due to careful and unprejudiced attention to the smallest and most insignificant detail. Truly, in the words of the R.F.C. arms, "Per Ardua ad Astra", - "By our Efforts even to the Stars."

THE

ENGINEERING JOURNAL

THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOL. V. January 1922 No. 1

Greetings

The President and Council of The Institute for the year just closed, desire to congratulate the members and the Branches on the progress that has been made during the year, particularly noticeable in increased membership and greater Branch activity.

To every member of The Institute the President and Council extend sincere wishes of good will, and express the hope that during the coming year, engineering work will be much more active, and that the members of The Institute will see their dreams realized in greater measure than ever before.

Annual Meeting Announcement

The Annual General Meeting of The Engineering Institute of Canada will be held at Montreal on Tuesday, January 24th, 1922, at ten o'clock A.M., and will be followed by a one day professional meeting under the auspices of the Montreal Branch.

The October *Journal* announcement regarding the Annual Meeting stated that the Annual Professional Meeting would be held in Winnipeg, February 21st, 22nd and 23rd. Owing to representations received, advising that it would be desirable to hold the Annual Professional Meeting at Winnipeg at a later date, the matter was referred to the Winnipeg Branch by the Council, no decision having been reached at the time of going to press for the December issue, the announcement of the business meeting only was included. Following the meeting of Council held on December 20th, it is possible to announce the decision of the Winnipeg Branch that on account of request from Ontario and if for the general welfare their meeting be postponed until September 5th, 6th and 7th, was heartily approved. Owing to the time elapsing between the business meeting and the Winnipeg professional meeting, it was considered by Council advisable, in order to make the meeting at Montreal more attractive, to hold a one day professional meeting, provided the co-operation of the Montreal Branch was secured. The Montreal branch executive, at a meeting held immediately after the Council meeting, unanimously approved of the suggestion that the Montreal Branch should hold a professional meeting in conjunction with the Annual Meeting, on the day following, January 25th.

Although too early to give all details, the members of *The Institute*, coming to Montreal for the Annual Meeting, are assured that they will not only have the opportunity of taking part in the business portion of the Meeting, but that enjoyable social functions will be planned for their entertainment.

Transactions of Other Societies.

It affords considerable satisfaction to be able to announce at this time that definite arrangements have been made with the four Founder Societies of the United States, The American Society of Mechanical Engineers, The American Institute of Mining and Metallurgical Engineers, The American Society of Civil Engineers and The American Institute of Electrical Engineers, whereby members of this Institute have the privelege of receiving the transactions and publications issued by the Founder Societies at the same price as paid by their own members.

The transactions and publications of the Founder Societies may be ordered direct or through the headquarters' office.

Institute Songs

During the past two years a complete change has taken place in the nature of the social functions attendant upon *Institute* meetings. The more or less perfunctory speech is giving way to the Community song, for the better, as all who have attended *Institute* functions of recent years will readily admit.

It has been planned for sometime to issue an *Institute* Song Sheet, and the Secretary has been collecting for that purpose. Suggestions are called for, and any member having any verse relative to engineers, any paraphrase of a popular air directed towards engineering, or any suggestions of songs which he thinks should be included, they will be gratefully received at the Secretary's office. Various college yells will be included, as all Canadian universities are represented in *The Institute* membership. One or two have been received that make light of the work of the engineer and his responsibility, but that is not the kind that it is intended to publish, but rather those of a boosting, inspirational nature.

It is hoped that the members will respond readily to this request, and forward suggestions as soon as convenient. Herewith is reproduced the most recently received suggestion, the key-note of which is along the right line.

I Wanna be in E. I. C.

TUNE: — *I Wanna be in Tennessee.*

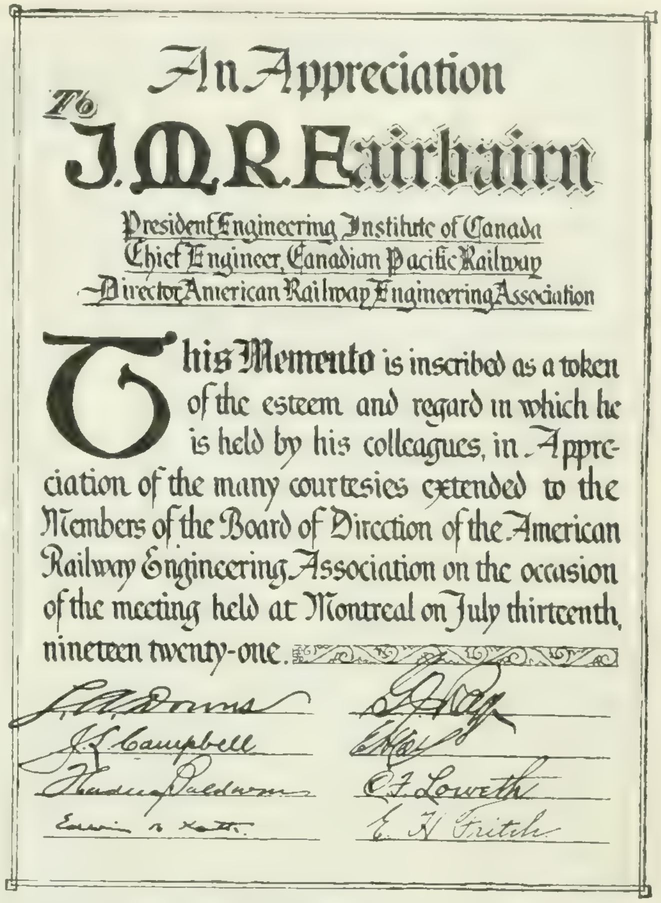
I wanna be in E. I. C.,
Our own Society,
Where the sunny atmosphere
Sends out its radiant cheer
I wanna be where I can see
The engineering feats
Of all the world, upon the lantern sheets
I wanna hear the engineer
Describe with modest mien
And show upon the screen
The things he's done and seen
Come and sing our songs
And forget about our wrongs
And happy be, eternally
In our dear old E. I. C.

Acknowledgment of Courtesies

At a recent meeting in New York of the Board of Direction of the American Railway Engineering Association held at their Headquarters, an event of interest to all members of *The Institute* took place. On the occasion referred to, President J. M. R. Fairbairn was presented by the Board of Direction with a beautifully engrossed memento, fittingly framed, of the Board's meeting at Montreal in July last.

The presentation was made by President L. A. Downs, who gave a brief and pleasing address of appreciation of the courtesies extended by our President and by other members of *The Institute.* Although taken by surprise, Persident Fairbairn made a suitable reply, extending his thanks for the beautiful souvenir of a happy gathering, as he felt the pleasure had been largely his, and that of those associated with him in Montreal. The memento, which was autographed by the members of the Board present at the meeting is reproduced, and will, no doubt, be highly prized by President Fairbairn.

President Downs advised the Board that on behalf of the members of the Board of Direction, he had addressed communications of appreciation for courtesies extended by their Canadian hosts on the occasion of the meeting of the Board at Montreal on July 13th and 14th, including J. M. R. Fairbairn, President of *The Engineering Institute of Canada*; Julian C. Smith, Vice-



An Appreciation

To J. M. R. Fairbairn

President Engineering Institute of Canada
Chief Engineer, Canadian Pacific Railway
Director American Railway Engineering Association

This Memento is inscribed as a token of the esteem and regard in which he is held by his colleagues, in Appreciation of the many courtesies extended to the Members of the Board of Direction of the American Railway Engineering Association on the occasion of the meeting held at Montreal on July thirteenth, nineteen twenty-one.

President Shawinigan Falls Water and Power Company; F. W. Cowie, Chief Secretary of the Montreal Harbour Commission; Fraser S. Keith, Secretary, *Engineering Institute of Canada*, and the management of the Canadian Pacific Railway Company.

Registration — Pro and Con

In view of the prominence which has been given during the past few years to the question of registration for the professional engineer in Canada and the acts already in force in all the Provinces but two, it is of considerable interest to have a light thrown on the situation as it exists in Great Britain. There the movement has not attained the momentum of the Canadian agitation for registration of the professional engineer but more than one of the professional engineering organizations is taking up the matter with some vigour. Whereas in Canada it is generally felt that the title "professional engineer" is sufficiently distinctive in Great Britain the expression is that of "chartered engineer", and parliamentary powers are to be sought to make this title only available to the professional engineer. Opinion is, however, by no means unanimous as to the advantages of this step and following thought provoking editorial from "The Electrician" is worthy of study by the Canadian professional engineer.

The Chartered Electrical Engineer

In the short time that has passed since the granting of a Royal Charter to the Institution of Electrical Engineers, it has become evident how widespread is the gratification at this increase in

status, accompanied as it is by so signal a mark of the Royal favour. This gratification, which is both natural and laudable, exists in spite of the feeling that the possession of such a document can have but a shadowy influence on the average electrical engineer's power of earning his bread and butter, or in assisting the Institution to take its proper place in leading the electrical profession and industry. Nevertheless, it was high time that the Institution should be invested with that prestige which is the prerogative of a State-constituted association as distinguished from a private company, and allowed to take the official position to which its influence and good work entitled it.

But though the charter places a Royal seal on the work and influence of the Institution, after all prestige is a quality which is generated from within rather than from without. If, therefore, the Institution is to be worthy of a Royal Charter, it must be the aim of its members to ensure that its policy and action are worthy of a profession to which it is their pride to belong. In other words although the possession of a Royal Charter confers a well-merited distinction on electrical engineers it requires from them a recognition that their profession has received a promotion which carries with it an additional responsibility. The possession of a Charter is a small thing, unless they continue to make the Institution worthy of the profession and industry it represents.

To discuss the new Institution which the possession of a Royal Charter will bring in its train is, therefore opportune. It will, first, ensure, on paper, that no one may use the title of electrical engineers, unless he or she is a member of the Institution of the Electrical Engineers. It will allow a sharp line of demarcation to be drawn between authorized and unauthorized practitioners, and will place clearly before the public the choice of employing duly qualified men under certain guarantees as regards the knowledge and performance they bring to their work, or of availing themselves of piratical outsiders, accompanied by a certain risk that is by no means off-set by a problematical saving of their pockets. It is true that the public cannot be forced to employ the real or chartered electrical engineers, but it should be the aim of chartered members to see that it is worth their while to do so by a display of individual skill and insight.

If we continue to look at this matter from the public's point of view, however, we find that these sanctions are moral rather than penal. No attempt is to be made to force the public by Act of Parliament or Order in Council to employ only chartered electrical engineers. The attempt could only fail if it were to be made. In this connection the benefits that are conferred by the kind of recognition we are trying to obtain are enormously exaggerated, both as a means of protection and as a method of obtaining wealth and work. To be entitled to the designation "chartered electrical engineer" may, therefore, be little more than a barren honour unless the public can be persuaded to realize that the holder of the title is able to do for them something that cannot be done so well by anyone else, despite protestations to the contrary, of which, incidentally, there will be many, both strident and voluminous.

The lesson the embryonic chartered electrical engineer has to learn is that upon his own exertions alone depend the value of his title, that if to secure that title he imposes upon himself and upon candidates for admission to the profession the necessity of completing a certain course of education and of complying with certain rules, all will be well, and that to be called a chartered electrical engineer will be a mark of honour. That if this is not done and he allows his ranks to be thrown open to all and sundry, the titel, though high-sounding, will be empty and barren of any value.

It is, therefore, essential that the Institution of Electrical Engineers should jealously guard admission to its ranks. Possession of a Royal Charter, the institution of registration for engineers, the laying down of standards of conduct are nothing in themselves. They are, indeed, little more than indications of a policy of purification, which to be successful must be justly and fearlessly carried out. The individual chartered electrical engineer has an equal responsibility in proving to the public, not only that he is competent in his profession, but that he is more competent than the unchartered free-lance man. While, therefore, we view with pleasure the constant growth of the membership of the Institution of Electrical Engineers, we must reiterate the importance of ensuring that such membership is not to be lightly granted.

American Railway Association

An interesting little volume has been published by the American Railway Association relative to the past and present activities of the Association. A copy has been presented to *The Institute* and is available for reference in the Library. The American Railway Association was founded in 1871 and has expanded to a remarkable extent, the membership list including railways in Canada as well as Mexico, Cuba and Japan. On the Board of Directors are a number of Canadians including Howard G. Kelley M.E.I.C., president of the Grand Trunk Railway and E. W. Beatty, president of the Canadian Pacific Railway.

The Association work is conducted by committees dealing with operating, transportation traffic, engineering, freight claims, automatic train control, etc. and the work of these committees is most noteworthy.

Publications of the British Engineering Standards Association

The following specifications and reports have been issued by the British Engineering Standards Association and can be obtained at twenty-five cents per copy from Capt. R.J. Durley M.E.I.C., Secretary, Canadian Engineering Standards Association, Room 112, West Block, Ottawa. A series of translations of a number of the most important specifications and reports issued in French, Italian, Spanish and Portuguese have also been issued by the British Engineering Standards Association and can be obtained from Captain Durley, a revision of the British specification for Portland Cement has also been issued.

Condenser Tubes and Fittings for Marine Condensers;
Creosote for preservation of Timber;
Wood Poles for Telegraph and Telephone Lines;
Terms and definitions for Automatic Telephone Systems;
Benzol for Motor Fuel;
Tungsten Electric Lamps;
Metallic Resistance Meterials for Electrical Purposes;
Switches and Circuit breakers for pressures not exceeding 660 volts;
Tramway Tires;
Soldering Sockets for Electric Cables;
Electrical Pressures for new systems of installations.

Errata

In the letter on "The Metric System" appearing in the December number, the word "Meteorological" should have been "Metrological".

THE ANNUAL GENERAL MEETING

OF THE INSTITUTE
WITH WHICH WILL BE ASSOCIATED A

PROFESSIONAL MEETING

UNDER THE AUSPICES OF THE MONTREAL BRANCH,
WILL BE HELD AT

MONTREAL, JANUARY 24th and 25th

PROGRAMME

(Subject to alteration)

Tuesday,	Jan. 24th,	9.00 a.m.	—	Registration, E.I.C. Headquarters, 176 Mansfield St.
"	"	10.00 a.m.	—	Annual Meeting Called to Order.
"	"	1.00 p.m.	—	Informal Luncheon. (Tickets, $1.00) C.P.R. Windsor Street, Mezzanine Dining Room.
"	"	2.30 p.m.	—	Resumption of Business Meeting and President's Address.
"	"	7.30 p.m.	—	Banquet, followed by Smoking Concert. (Tickets, $5.00) Rose Room, Windsor Hotel.
Wednesday,	Jan. 25th,	9.30 a.m.	-	Visit to Dominion Engineering Works, Rockfield. (Large 41,000 h.p. turbine unit for Shawinigan may be seen under construction)
"	"	1.00 p.m.	—	Luncheon — Rose Room, Windsor Hotel. Members and Ladies. (Tickets, $1.50 — Visiting Members, Complimentary) Followed by short address.
"	"	3.30 p.m.	—	Professional Paper at Headquarters.
"	"	8.15 p.m.	—	" " " "

Accommodation for Visiting Members will be reserved at the Windsor Hotel.

Will you please notify:

J. L. Busfield, Secretary-Treasurer, Montreal Branch, E.I.C.,
260 St. James St., Montreal,

of your requirements and of the functions you expect to attend — or advise your local Secretary.

MONTREAL BRANCH EXTENDS A CORDIAL INVITATION TO ALL MEMBERS

A number of important committee meetings will take place about the same dates.

CORRESPONDENCE

Advertising in the Journal

Dec. 14th, 1921.

Editor, *Journal:*—

Dear Sir:

All members of *The Engineering Institute of Canada* are directly interested in making a success of *The Journal.* Advertising has a great effect on the financial success of *The Journal* and, hence, anything we members can do to encourage firms to advertise therein will greatly benefit *The Institute* and us.

In connection with the work of the Sub-Committee of the Ottawa Branch on Advertising, one firm stated that the money they spent was wasted, as no enquiries or business had come to them as a result of their advertisement in *The Journal.* This may or may not have been the case, as unless those engineers writing to a firm mention that they have seen their advertisement in *The Journal,* the firm has no way of knowing that their ad. has served its purpose to them. Another Ottawa firm has mentioned that its advertisement in *The Journal* has been the most productive of results of any of its magazine or newspaper advertising, this statement being made solely because engineers have mentioned that the firm's advertisement has been noticed in *The Journal* when they are writing for prices or information.

Evidently incidents of this nature are what determine the policy of a company in regard to advertising and it will contribute greatly to the success of *The Journal, The Institute* and ourselves, if every member consistently mentions the fact that they have seen a firm's ad. when they are writing to that firm information or prices. Let's boost our *Journal* in every possible legitimate manner.

Yours faithfully,

J. L. Rannie, A.M.E.I.C.,
Convener of Sub-Committee on Advertising,
Ottawa Branch.

Society of Chemical Industry, Montreal Section

A series of monthly meetings with an agenda of scientific papers and addresses by eminent authorities on the subjects dealt with is being held by the Montreal Section of the Society of Chemical Industry.

Among the interesting features of the session's programme is the joint meeting of the Society with *The Engineering Institute of Canada* and the Canadian Institute of Mining and Metallurgy. This meeting is to be held on January 20 at the Queen's Hotel, preceded by the usual dinner. The papers at this joint meeting will include "Administration of the Explosives Act in Canada," by Lt.-Col. G. Ogilvie, chief inspector of explosives, and "The Electric Steam Generator, its Possibilities and Limitations," by F.T. Kaelin, M.E.I.C., chief engineer of the Shawinigan Water and Power Company.

What is also considered as an important move forward is the formation of an Engineering Group in the Society of Chemical Industry, which will consist of members of sections in Canada and the United States. This group is now being organized and when flourishing will form a valuable meeting ground for the exchange of ideas and discussion of problems where engineering and scientific developments require a closer co-operation.

Since the convention of August last when the Society of Chemical Industry, (which has its headquarters in London, Eng, with Sections in all parts of the world), held its annual meeting in Canada for the first time, and honoured Canada by appointing a Canadian President in the person of Dr. R. F. Ruttan, of McGill University, the members of the Montreal Section have been most active, as the programme for the Session 1921-22 will show.

The first meeting was held on Nov. 18, at which Prof. R. de L. French M.E.I.C. of McGill University, gave a paper dealing with the carbonization of Western Lignite. This address was accompanied by illustrated lantern slides, and Professor French described in detail the efforts that are being exerted to convert this valuable material into economic form. He described the difficulties which had to be overcome owing to the friable nature of this special lignite, and with illustrations showed how these had been surmounted and a carbonized product, suitable for compression into high grade scientific briquettes, secured. This new industry opens up considerable prospects of development, nor only from the fuel standpoint, but the utilization of the resulting tar and the production of by products of considerable value. This is all matter for future research in the laboratory, and may lead to developments of the utmost importance to Canadian Industry.

Another paper, given by E. Levitt, described a method for the decomposition of Clays and Feldspars. This method possesses the merit of newness, and the lecturer claimed that a high yield of calcined alumina of extreme purity is obtained, and that the by-products are directly useable, or enter again into the cycle of manufacture with almost negligible percentage of loss. The process promises well, and should it be adopted on a manufacturing scale would obviate the importation of water glass and aluminum sulphate, both of which substances are used in large amounts in Canada.

The next meeting was held on December 16 in the Physics Building, McGill University, when Prof. Eve of the University, spoke on Wireless Telephony. A demonstration was arranged by the Marconi Company the wireless telephone being explained by D. R. P. Coates.

On February 20th a lecture will be given on "Chemistry and the Motion Picture" by C. E. Kenneth Mees, D.Sc., and on March 17th the paper will be "Water Supply Purification" by Jas. O. Meadows.

Canadian Sitka Spruce

The Dominion Forestry Branch has just issued a bulletin entitled "Canadian Sitka Spruce" —Its Mechanical and Physical Properties "which was prepared by Loren L. Brown, A.M.E.I.C., recently superintendent of the Forest Product Laboratories of Canada at Vancouver, B.C., and now British Columbia lumber commissioner

for Eastern Canada with headquarters at No. 1 Adelaide St., East, Toronto. This bulletin should be of interest to all users of softwoods, as Sitka Spruce posesses characteristics which make it valuable not only in building construction, but also to the factory trade. It can be obtained on application to the Director of Forestry, Department of the Interior, Ottawa.

EMPLOYMENT BUREAU

Situations Wanted

Electrical Engineer

An apprentice electrical engineer finishing term with Canadian General Electric Company, seeks employment in Montreal. Box 86-P.

Electrical Engineer

Graduate B.Sc. in electrical engineering, McGill University, 1921, desires position in electrical engineering work. Practical experience in electrical testing. Summer with Northern Electric Company, valuation with Dr. Herdt. References furnished on request. Box No. 88-P.

Mechanical Engineer

Engineer, Jr.E.I.C., age 23. Six months experience mechanical drafting, designing and engineering, including supervision over manufacture of special machinery, design of tools, jigs and attachments for the manufacture of iron working machine tools. Improvement of lathes, shapers, drills, grinders, pipe threading machines, tumbling mills and a thorough knowledge of hydraulic pumps. Desires change. Salary expected $160.00 per month. Apply Box 87-P.

Situations Vacant

Assistant Mining Engineer

3442. An Assistant Mining Engineer, Mining Lands and Yukon Branch, Department of the Interior at Calgary, Alta., at an initial salary of $2,100 per annum, which will be increased upon recommendation for efficient service at the rate of $120 per annum, until a maximum of $2,580 has been reached. This initial salary will be supplemented by whatever bonus is provided by law.

Duties.—To assist in making examinations of mineral deposits; in some cases to have charge of mining survey parties; to test mineral samples; to inspect refining mills, shops and plants which are engaged in concentrating, refining, or otherwise preparing mineral products; and to perform other related work as required.

Application forms properly filled in must be filed in the office of the Civil Service Commission not later than January 12, 1922. Application forms may be obtained from the office of the Employment Service of Canada or from the Secretary of the Civil Service Commission

By Order of the Commission.

W. FORAN, *Secretary.*

Members Exchange

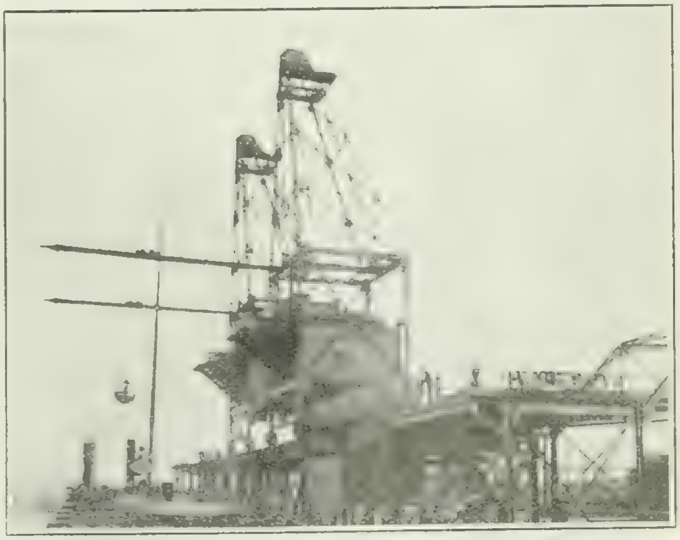
Offices to Rent

One or two very desirable offices are available for consulting engineers. In connection with the rental of these offices, telephone, stenographic and typewriter services are available, the telephone service being placed on the firm's exchange. These offices are also centrally located. Apply Box 19-A.

Imperial Oil Ltd. Coal Handling Plant at Sarnia

The oil refinery at Sarnia of the Imperial Oil Co. Limited, of which Thos. Montgomery is chief engineer, is the largest in Canada, and the consumption of coal in their water hogs and stills approximates 200,000 tons annually.

The coal is received at the dock in steamers specially constructed for this purpose, and carrying cargoes of 6,000 tons. This coal is taken from the hold of the steamer by movable towers, each equipped with an automatic grab bucket having a capacity of about 3,000 lbs. The hoisting of these buckets is accomplished by direct acting steam engines, one in each tower, and the operation of hoisting in each tower is accomplished by one man only. The coal is elevated a distance of about 50 ft. and discharges into cable cars running on an elevated trestle for carrying the coal across the railroad tracks and public street into the Imperial Oil yard, where the coal is discharged into a large pocket for distribution to the various portions of the plant by means of auto trucks.



The photograph shows the two unloading towers in operation; each tower has an unloading capacity of 250 tons per hour, giving a total of 500 tons for the two towers.

The present plant is laid out so that eventually the cable road conveying system can be extended a distance of about half a mile, so as to deliver coal direct to the various stills and power plants and also to the storage pile. The complete plant was designed, manufactured and constructed by the Canadian Mead-Morrison Company Limited.

British Industries Fair

The eighth annual British Industries Fair which embraces a large number of the most important lines of British trade, will be held in London and Birmingham from 27th February to 10 March. This is purely a trade fair where buyer and seller meet, not an exhibition. This Fair, whether regarded from the point of view of size, diversity of products shown or resultant business, now surpasses in importance and value to the world's markets any other trade fair or similar purpose. A visit to the Fair will convince overseas buyers that enormous strides have been made in Britain's post war production. A considerable number of Canadian buyers are making arrangements to attend. Admittance is restricted to trade buyers on invitation of the British Government and business is not impeded by crowds of sightseers.

While participation in the Fair is confined to manufacturers in the British Empire as exhibitors, many overseas buyers will undoubtedly continue to utilize the services of merchant houses who fill so important a role in the export trade of the United Kingdom. From the buyers' point of view, however, the Fair has the great advantage of personal contact with the actual producer.

The British Trade Commissioners in Canada will be pleased to give full particulars and to issue invitation cards to Canadian buyers who propose to visit the Fair at their following addresses:-

248 St. James Street, Montreal,
260 Confederation Life Building, Toronto,
610 Electric Railway Chambers, Winnipeg.

OBITUARIES

A. M. Phillips, A.M.E.I.C.

A. M. Phillips, A.M.E.I.C., died on November 15th in Kamloops, B.C., after a short illness from blood poisoning contracted through driving a splinter into his left thumb. He was born in August 1883 at Valleyfield, Que., and entered the Royal Military College at Kingston in 1901 graduating in 1904. On graduation Mr. Phillips entered the service of the Grand Trunk Pacific, serving for one year as instrument man in Northern Quebec; for two years subsequently he was resident engineer on the Napierville Junction Railway. In 1910 Mr. Phillips was appointed resident of the Grand Trunk Pacific Railway at Kenora, Ont.; in 1911 to 1917 he was resident engineer with the Canadian Northern Railway at Kamloops, and in 1918 he was appointed assistant engineer, Dominion Water Power Branch in the same city. Mr. Phillips was elected an Associate Member on April 9th, 1910.

J. Emile Girard, Q.L.S., A.M.E.I.C.

J. Emile Girard, Q.L.S., A.M.E.I.C., died suddenly, on July 14th, 1921, while he was aboard the S.S. Cape Diamond, on a vacation trip to the Saguenay. He was born on the 2nd. of December 1867 at Bécancour, county of Nicolet, P.Q., of Léger Girard and Eugénie LeBlanc. After attending a local academy, he completed his education at the Three Rivers Seminary and studied Land Surveying under G. P. Roy, Q.L.S., of Quebec, with whom he served during several years, and became a

J. EMILE GIRARD, Q.L.S., A.M.E.I.C.

member of the Corporation of Land Surveyors for the province of Quebec in 1890. In 1901, Mr. Girard was appointed to the Survey Branch of the Department of Lands and Forests, Quebec, as assistant to the director of surveys. In 1908, he became inspector of surveys for the Provincial government and, in 1910, director of surveys for the Province of Quebec. He was admitted in the Canadian Society of Civil Engineers, now *The Engineering Institute of Canada*, as an Associate Member in 1905.

Mr. Girard married Miss Blanche Fafard, of Quebec, in 1914. His residence was Quebec. He was well known and esteemed by many engineers and by all the Quebec Land Surveyors.

PERSONALS

T. H. Byrne, A.M.E.I.C., has been appointed road superintendent for Carleton County, Ont.

W. E. Keyt, A.M.E.I.C., has been transferred by the Department of Public Works to Nelson, B.C.

J. F. F. Mackenzie, Jr.E.I.C., is now with the Dominion Bridge Company Limited, at Lachine, Quebec.

A. G. McLerie, A.M.E.I.C., formerly with the Laurentide Co. Ltd., is at present with the Royal Canadian Air Force at Camp Borden.

E. S. Miles, A.M.E.I.C., formally of Matane, Que., is now with Doheny, Quinlan & Robertson, Limited, at Thorold, Ont.

L. H. Wheaton, A.M.E.I.C., has been appointed Commissioner of the Joint Expenditure Commission to the County of Cape Breton.

A. T. Perrin, A.M.E.I.C., has been appointed plant and equipment engineer for the Parker Motor Car Company, Limited, at Longue Pointe, Que.

E. C. Girouard, A.M.E.I.C., has opened an office as manufacturers' broker and agent at 224 St. James St., Montreal. Mr. Girouard is particularly interested in contractors' plant.

W. D. Coulter, S.E.I.C., formerly with the Farris Bridge Company, at Cumberland, Maryland, is now in the drafting department of the Lackawanna Bridge Company, at Buffalo, N.Y.

E. L. Miles, M.E.I.C., has received the appointment of county engineer, to be combined with his regular duties as county road superintendent for the County of Victoria, Ontario. Headquarters, Lindsay.

Captain G. V. Douglas, A.M.E.I.C., has joined Sir Edward Shackleton's expedition to the Antarctic and sailed South with the exploring party in the "Quest". The good wishes of every member of *The Institute* go with Captain Douglas.

H. R. McClelland, M.E.I.C., has left for an extended business tour in Great Britain. Mr. McClelland is an active member of the Montreal Branch, and recently delivered a very interesting paper to the Branch on Shipbuilding.

Herbert P. Heywood, A.M.E.I.C., is superintending construction of the Muddy Run Trunk Sewer, Niagara Falls, Ont., as resident engineer. Mr. Heywood designed this sewer for James, Proctor, and Redfern, consulting engineers, the cost of the work being $250,000.

J. A. Burnett, A.M.E.I.C., will carry on the business of the consulting engineering firm formerly known as Smart & Burnett. V.I.Smart, M.E.I.C.has been appointed by the Government in connection with appraisal work. It is Mr. Burnett's intention to carry on his consulting practice, and specialize in appraisal work.

Charles E. Fraser, M.E.I.C., James H. Brace, M.E.I.C., and George C. Clarke, M.E.I.C., have issued an attractive year-book for 1920 of Fraser, Brace Limited. The purpose of the book is to give an idea of the variety of the work undertaken by the firm. It is attractively printed with many illustrations.

Donald L. Derrom, M.E.I.C., who has spent the past few months in Montreal, and was particularly active as having been in charge of the Service Department of the McGill Reunion, has accepted a position as mechanical engineer with the Dominion Atlantic Railway, with headquarters at Kentville, N.S.

H. R. Safford, D.Sc., M.E.I.C., is to be congratulated on the further evidence of his success, as indicated by a recent announcement of the President of the Chicago, Burlington and Quincy Railroad Company, advising that at a meeting of the Board of Directors held on December 1st, Mr. Safford, assistant to the president, was elected vice president to the company. Mr. Safford's friends in Canada will be glad to hear of this promotion.

Geo. B. Mitchell, M.E.I.C., manager of the Foundation Company at Lima, Peru, has presented to *The Institute* a copy of the Centennial edition of the West Coast Leader of Lima, Peru. The Centennial edition gives an immense amount of information as to present conditions in the republic of Peru and gives an insight into the remarkable energy and foresight of Canadian British and American firms which have helped to develop the resources of the country.

Geo. W. Craig, M.E.I.C., Chairman of the Calgary Branch has just returned from an extended tour through the central States, during which he attended two engineering meetings, giving an outline of the work that *The Institute* is doing for engineers in Canada, especially emphasizing the activity of *The Institute* in legislative matters and the individual attention given to members. Mr. Craig was gratified to note the interest taken in the work of *The Engineering Institute* by engineers whom he met on his visit.

W. G. Macnaughton, A.M.E.I.C., recently of Kapuskasing, Ont., and formerly of Spokane, who has for many years been connected with the pulp and paper industry as professional engineer, has accepted the secretaryship of the Technical Association of the Pulp and Paper Industry, with headquarters at 18 East Forty-first Street, New York City, succeeding T. J. Keenan, who has retired as editor of the paper. Mr. Macnaughton will also edit a section of the Paper Trade Journal, which is acting as the official organ of the Pulp and Paper Association.

J. G. SULLIVAN, M.E.I.C.
President - elect for 1922

Boyd Candlish, A.M.E.I.C., announces that he has just appointed an assistant who will reside permanently in Hamilton. Mr. Candlish is chief engineer of the Herbert Morris Crane & Hoist Company Limited, of Niagara Falls, and is a specialist in lifting machinery. Mr. Candlish will continue as heretofore to make frequent visits to Hamilton for the purpose of working out problems in lifting and transporting, but his assistant, Mr. Fred Simpson, is competent to lay out the preliminary lines of such studies, and Mr. Candlish's friends will be pleased to know if his presence there.

Horace L. Seymour, C.E. (Toronto), A.M.E.I.C., town planning engineer of the firm of Frank Barber and Associates Ltd., consulting engineers, Toronto, has been retained as city planning consultant to the city of Niagara Falls, Ont., in which connection his first work will be to consult with Carl Gardner, B.A.Sc., A.M.E.I.C., in the preparation of study maps and data, which will form the basis of zoning maps and proposed zoning ordinances, as well as for other features of a city planning scheme. This is a feature of municipal work which has been seriously neglected, and the city of Niagara Falls is to be commended for its up to date policies which are sure to have beneficial results.

G. T. Clark, M.E.I.C., addressed the Engineering Society of the University of Toronto on November 23rd, on the organization of engineers in general and *The Engineering Institute* in particular. Mr. Clark first spoke of the need for organization in the engineering profession, one of the most important of the present day, and then dealt with the organization developed by *The Institute.* He traced the growth of the Canadian Society of Civil Engineers from the days when the civil engineer could handle every branch of the profession to the present day when every engineer is perforce a specialist. He pointed that the Canadian Society of Civil Engineers had kept pace with the changing conditions and had been re-organized under its present title with a remarkably flexible constitution. Mr. Clark showed that membership was a mutual benefit to *The Institute* and the member in the exchange of ideas and the promotion of technical knowledge. In conclusion the splendid work of *The Institute* in protecting the public from the impostor and in maintaining a high moral code were indicated.

BRANCH NEWS

Vancouver Branch

P. H. Buchan, A.M.E.I.C., Secretary-Treasurer.

The Annual Meeting of the Branch was held on Dec. 21st, when the following matters were disposed of

Election of new Branch Officers:—

Chairman, Chas. Brakenridge, M.E.I.C.

Vice-Chairman, A. C. Eddy, M.E.I.C.

Secretary-Treasurer, P. H. Buchan, A.M.E.I.C. 930 Birks Building.

Executive: J. N. Anderson, A.M.E.I.C.; Wm. Smaill, M.E.I.C.; Major-General R. G. Edwardes Leckie, C.M.G., A.M.E.I.C.

The Chairman, Vice-Chairman and Secretary-Treasurer are elected for the year 1922, and the three members of the Executive Committee named for the years 1922 and 1923, there being three members of last year's Executive Committee acting for a second term, as provided in the By-law.

The amendments to the by-laws were both carried, the first by a majority of 54 to 1, the second by 49 to 3.

The matter of suggested meeting of Branch Secretaries was discussed and was referred to the Executive Committee to go into more fully.

The letter of Council regarding the suggested arrangements with the B. C. Technical Association was read and discussed and was also referred to the Executive Committee to consider before sending to the B. C. Technical Association.

Meeting of Association of Professional Engineers of British Columbia.

The following report has been received from E. A. Wheatley, A.M.E.I.C., Registrar of the Association of Professional Engineers of the Province of B. C.

The Second Annual General Meeting of the Association of Professional Engineers of the Province of British

Meeting of Association of Professional Engineers, British Columbia.

Columbia was held on 3rd December, in the Rose du Barry room of the Hotel Vancouver and commenced at 11 o'clock in the forenoon; after the usual passing and adopting of the 1920 minutes, Major W. G. Swan, D.S.O., M.E.I.C., chief engineer of the Harbour Commissioners and president of the Association during 1921, addressed the meeting. During the year the membership of the Association had grown to 754 and on account of nine resignations and the death of five members, which had been a blow to all engineers in the province, the actual number at the time was 740.

The chairman drew attention to the fact that 116 applications had been unavoidably rejected although the Council had been fairly lenient with applicants and had made it a point of policy that if an applicant had been obtaining his living by carrying out engineering work, even if his qualifications did not approach the standard desired, he had been granted membership in the Association. Major Swan thought that the Association was now on its feet. In the future qualifications would be made more stringent and possibly later it would be necessary that all applicants should have diplomas or college degrees before admission.

Major Swan referred to the question of joint quarters and joint staff with other engineering bodies, which had been recommended at the last Annual Meeting, and informed the meeting it had been found impossible to arrange for a joint staff, but he was very happy to be able to report that joint quarters had been arranged; and not only with *The Engineering Institute of Canada*, Vancouver Branch, and ours, but also with the British Columbia Technical Association, Vancouver Section of the American Institute of Electrical Engineers, the Institute of Architects and a small Chemical Society, which made altogether some six Associations housed under one roof.

The Chairman commented on their indebtedness to *The Engineering Institute of Canada* for allowing their library to be opened to all the members of these Associations, and drew attention to the need of the appointment of various committees, including a legislative committee, who should, in the light of past experience go in detail through the Act and make recommendations to the Council of necessary changes. Also a library committee should be considered in the hope that they might finally obtain a library which should be up to date and of the greatest use to all the engineers, whatever their branch, who are members of the Association.

The result of the ballot was declared as follows:— D. O. Lewis, M.E.I.C., President, J. M. Turnbull, Vice-President, and G. A. Walkem, M.E.I.C., A. E. Foreman, M.E.I.C., J. Muirhead, M.E.I.C., and H. L. Johnston, M.E.I.C., members of Council. Major Swan invited the new President, Mr. Lewis, to address the meeting. Mr. Lewis briefly remarked on the great amount of work which was in front of them all and assured the meeting that anything in the interest of the engineers appealed very greatly to him and he would use his best endeavours to carry out their wishes and commands.

A number of changes of by-laws were introduced and passed. It was agreed and arranged that the incoming Council should endeavour to have round table conferences with *The Engineering Institute of Canada* and the British Columbia Technical Association, with a view to the Associations working together or co-operating in the interests of all engineers. This is considered a very important step in the right direction.

One hundred and fifty members were present at the meeting, which was marked throughout with a great deal of enthusiasm. A vote of thanks was extended to the retiring President for the energy, keenness and success with which he and the Council had conducted the affairs of the Association during 1921, to which Major Swan replied that it had been nothing but pleasure to work for them inasmuch that all the members of the Council had shown such interest in the affairs of engineers.

In the interval between the morning and afternoon sessions, a luncheon was held in the Hotel Dining room, and later a group photograph of the members was taken on the Court House steps.

Local News.

F. J. Whittaker, A. M. E. I. C., municipal engineer for South Vancouver has been appointed city engineer of Prince Rupert, B.C., and will commence his new duties about 15th December.

The Vancouver Branch has moved to 930 Birks Building, where joint quarters are being maintained with the Association of Professional Engineers of the Province of B. C., the Architectural Institute of B. C., the B. C. Technical Association, the Vancouver Section of the American Institute of Electrical Engineers and the Chemical Society.

The suite consists of a general office, board room secretaries room and reading room and library.

Calgary Branch

Arthur L. Ford, M.E.I.C., Secretary-Treasurer.
Floyd K. Beach, A.M.E.I.C., Branch News Editor.

Meeting of Association of Professional Engineers

On November 26th, a meeting was held in Calgary of the Association of Professional Engineers of Alberta. This meeting, while not of members of *The Institute* as such, was attended by many of them who are also members of the Association formed as a result of efforts started by *The Institute* to secure legislation.

Prior to this meeting there may have been a feeling that the legislation so far secured is of little practical value. At the close of the meeting that feeling had not only been dissipated, but all present felt that a real step toward the advancement of the profession has been achieved in the legislation secured, in its resulting organization of engineers of the province practising in all branches, and in the raising of ethical standards.

R. A. Brown, president of the Association opened the meeting by a very forceful talk outlining the work so far done. He pointed out that whereas the legislation secured provided only a protection for the name Professional Engineer, subsequent legislation respecting various undertakings in the province, such as the Irrigation Districts act, have provided that only a Professional

Engineer may do certain things. Attention was drawn to difficulties that have been met in passing on the credentials of various applicants for admission to the association, due in many cases to indefinite statements on the application form. Possibly some applications have been rejected that would have been accepted if they had been in clearer form and it is equally possible that some had been admitted whose qualifications were not as high as they should have been. At all events, legislation is admitted to be unjust if it takes away a man's livelihood, and if a man has made his living by the practice of engineering, we must allow him to continue, while restricting the entrance of new men until they can show their worth and right to practise.

The question of dual registration was raised. Should engineers be registered in two or more branches of engineering? The general feeling was that it was probably unwise to recognize legally any but the term Professional Engineer. The various branches were recognized within the Association for purposes of equal representation on the council. In any event, it is unwise to make any move toward amendment of the act, and those engineers who wish dual registration should receive it on proof of being entitled to it. The fact that registration is or is not made in a certain branch should have no bearing on the rights to discipline members for practise that shall endanger the public security of life or property.

The meeting, which was held in the afternoon in the Board of Trade rooms, was followed by a banquet and musical programme. R. A. Brown presided throughout and proved himself a most able chairman, bringing several delicate situations to a point of agreement.

Engineers and the Law

When a married man loses his own money he has himself to blame and his wife to blame him, but if an engineer causes clients to lose their money he has not only the losers to blame him, but he may make himself amenable to the law.

When dealing with companies and corporations, the engineer should know the ground upon which they stand before risking much of his own time and talent or before allowing a client to risk his money. It would appear that the only competent authority to pass on the rights of a company to contract, is a lawyer well versed in corporation law.

This very briefly is the meat that engineers can draw from a very able talk given by Alexander Hannah, barrister, of the firm of Lougheed, Bennett, and Company, to the Calgary Branch on December 2nd. In opening his talk, Mr. Hannah remarked that the subject he was to cover in an evening is one to which twenty or more lectures are assigned in a law school, and on which many lengthy volumes have been written, so that only salient features could be outlined. The reviewer is very diffident, being an engineer, in reporting Mr. Hannah's talk, which was so full of meaning as to leave one with the impression that hardly a phrase could be taken away from it without disturbing the meaning of the whole.

A corporation is regarded as a legal person. Since the fiction is admitted, the powers which it possesses must be fixed in some manner by law. Corporations may be classified as to size; the words trust, corporation, and company being variously used. Ordinarily a concern such as the Canadian Pacific Railway or the City of Calgary being entitled to the name of corporation, while the word company usually refers to a smaller concern.

Again, they may be classified as to the origin of their authority to do business. A Royal Charter endows the concern with the furthest reaching powers. Incorporation may also be obtained from the Dominion or the Provincial government by letters patent or by memorandum of association, or by an act of parliament (or act of legislature).

The Hudson's Bay Company is an outstanding example of incorporation by Royal Charter. Its powers cannot easily be questioned anywhere within the empire. The case of the Bonanza Creek Company was cited. In that case there was an association authorized to do business in Ontario, which went into the Yukon. Its right to hold mining lands in the Yukon was questioned and it took its case to the Privy Council. That body rested its decision on the form of incorporation which had been obtained from the Lieutenant Governor of Ontario under the great seal of that province. The ruling was that the company had rights flowing from the crown and were entitled to do business elsewhere than in Ontario.

Public service corporations, such as the City of Calgary, the Canadian Pacific Railway, the Gas Company, etc., require the right of expropriation. This right can be granted only by an act of parliament, so that in dealing with a company that may need this right, it is necessary that it be incorporated by an act that the act specify the right.

Further the speaker pointed out that, if a company is not incorporated in the province in which it is doing business, it is necessary to investigate and ascertain that it has obtained rights to do business in the province, as otherwise money might be tied up indefinitely while the courts thresh-out its rights.

A controversial subject is entered when discussing the merits of letters patent as against the merits of registration by memorandum and articles of association. Mr. Hannah stated there is much to be said in favour of registration of the regulations of a company in that for a small fee anyone could obtain from the provincial registrar full details of the powers of a company. In the case of letters patent, a company is regulated by its by-laws, and by-laws may be written and amended by the directors of the company. Unscrupulous directors might do many things harmful to the stock holders or to persons doing business with the company.

Mr. Hannah mentioned that articles of association may be written out in full, outlining all powers as desired, or they might be in a short form with reference to "Table A", an Alberta form which is now very antiquated. It provides, for example, that the office of a director shall *ipso facto* be vacated if he accept a contract or office of profit to himself from his company

A more sensible by-law or rule is that a director must declare his interest at a meeting of directors, and having so declared his interest, he is free to contract as an individual.

Contracts may be signed by authorized directors of a company without the seal of the company but in such

cases as an individual would use a seal, the seal of the company is affixed. The signature of one or more directors of the company then becomes merely a witness to the fact that the seal of the company was purposely and knowingly placed. Mr. Hannah then outlined where the seal of an individual or company is required.

Companies are sometimes looked on as a means of losing money quickly. Probably a lack of knowledge of what they can and cannot do would save many investors from losing their money. For example, in 1914 many people lost money in the oil boom who should not have done so had they inquired into their rights. A minimum suscription clause, for example, actually existed in some cases, and though the minimum subscription was not obtained the money actually subscribed was not returned.

In considering Mr. Hannah's talk as a whole, it was an impressive exposition of the value a lawyer has in any organization scheme of which a company is one factor.

Local News

Captain Hobart R. Carscallen, M.C., A.M.E.I.C., has been promoted to the position of office engineer in the irrigation division of the reclamation service at Calgary, and has removed from Ottawa where he has resided since returning from overseas. Captain Carscallen lost a leg while serving in France with the Canadian Engineers. This disability combined with his experience in irrigation work prior to going overseas and his genial disposition has made his promotion very acceptable to those who know him and have to work with him.

Angus Smith, M.E.I.C., has just been elected city commissioner for Calgary. He appealed to the electors on his record as city engineer for Victoria, Regina and Prince Albert, and defeated the present incumbent of the office by a small majority in the face of opposition by both newspapers. As he was comparatively unknown to the majority of electors, his success may be taken as a compliment to the profession as well as to himself.

Winnipeg Branch

Geo. L. Guy, M.E.I.C., Secretary-Treasurer.
E. V. Caton, A.M.E.I.C., Branch News Editor.

At a meeting of the Branch which was held on the 1st December, E. P. Fetherstonhaugh, M.E.I.C., in the chair, a series of films illustrating the paper making industry was shown.

D. A. Ross, M.E.I.C., read a short synopsis of the various methods of manufacturing wood pulp and paper, which was listened to with considerable interest by the members. The growing interest which is being taken in the paper industry in the West and the prospects of the installation of pulp mills in the Winnipeg district resulted in a large attendance.

Local News

J. G. Sullivan, M.E.I.C., was re-elected for alderman at the recent municipal elections.

Foundations In and Around Winnipeg

At a regular meeting of the Branch, held in the Engineering Buildings, Manitoba University, on the 9th. December, E. P. Fetherstonhaugh, M.E.I.C., in the chair, a paper on "Foundations In and Around Winnipeg" was presented by Harold Edwards, M.E.I.C., this paper being a summary of all information collected by a large Committee which has been working on the subject for some time.

The paper was introduced by a short description of the geological history and formation in and around Winnipeg, given by P. Burke Gaffney, M.E.I.C.

Mr. Edwards opened his address by emphasizing the very contradictory information the Committee has received and emphasized the necessity for more careful observations by the members and those interested to insure accurate information being obtained. He pointed out the condition of rock in the Winnipeg district, in which there appeared to be no regularity of elevation which could be relied upon, nor did there seem to be any general trend for the slope of the rock in any direction. Borings within short distances of each other showed considerable differences in the elevation of the rock and from a large number of results which have been obtained, spread over practically the whole Winnipeg area, there does not seem to be any definite line of rock elevation in the district. The usual covering over the rock, after the first foot or so of mould, was clay; boulders, hard pan, and gravel was found immediately over the rock, but in many cases exceptions to this were found, such as quicksand, soft blue clay under the hard pan and in one case a soft mushy clay immediately over the hard pan. The clay covering over the hard pan also varied greatly from a stiff yellow clay to a soft blue clay and in many cases a poor marle was found. The rock itself varied in places; in one case the layers were very soft and easily broken with a hammer. In many cases before reaching the true rock a layer of soft broken rock was found. In some cases layers of clay were found under the rock. Another point which required careful investigation was the water level under the soil. This had been found to vary from place to place and as a matter of fact several authentic cases were given where the water level within a short distance had varied considerably at the same time. It was also found that the water level varied from time to time and evidence pointed to this being somewhat dependent upon the state of Lake Winnipeg, although it was not sufficiently proved to be accepted without further investigation.

The speaker emphasized the necessity in all foundations for uniformity of loading. He suggested that a load of 4,000 lbs. per square foot (live and dead) should not be exceeded until some definite information had been obtained, as investigations show that buildings which had exceeded this loading had shown signs of trouble. Against this, however, he pointed out that buildings having a load of 7,000 lbs. per square foot were still in perfect condition.

The speaker concluded with impressing upon the members the necessity for co-operation from everybody in this investigation and requested that the Committee be notified of any condition which appeared to be unusual when foundations were being excavated or in borings being made in the district. He also emphasized the necessity for careful watching the question of water level in

the soil, as in his opinion this was one of the most important matters which affected the stability of foundations built on the Winnipeg clay.

Upon a motion before the Branch, the standing Committee on Foundations was reappointed to continue these investigations and the meeting concluded with a hearty vote of thanks to the speakers.

The meeting was largely attended and a live discussion took place, many interesting points being brought out

Lethbridge Branch

C. M. Arnold, M.E.I.C., Secretary-Treasurer.

On December 3rd the Corporate Members of *The Engineering Institute* resident in Lethbridge held an organization meeting at which the Lethbridge Branch was brought into being. The following officers were elected to serve until the regular Annual Meeting of the Branch in March : Chairman, Sam G. Porter, M.E.I.C.; Secretary-Treasurer, C. M. Arnold, M.E.I.C.; Executive Committee, G.N. Houston, M.E.I.C., C. D. MacKintosh, A.M.E.I.C., H.W. Meech, A.M.E.I.C.

Following the enthusiastic preliminary meetings which have been held in Lethbridge, it is expected that the new Branch will quickly blossom into one of the most active in *The Institute.*

Border Cities Branch

J. Clark Keith, A.M.E.I.C., Secretary-Treasurer.

The annual meeting of the Branch was held in the Cadillac Cafe, Friday evening, December 9th.

The reports of the officers and committees for 1921 were received, and on motion of M. E. Brian, A.M.E.I.C., seconded by H. C. McMordie, A.M.E.I.C., the reports were adopted.

The meeting then prodeeced to the election of officers for the year 1922. The following officers were elected:

Chairman	Geo. F. Porter, L.L.D. M.E.I.C.
Secretary-Treasurer:	J. Clark Keith, A. M. E. I. C.
Executive Committee:	A. J. M. Bowman, A. M. E. I. C
	L. M. Allan, A. M. E. I. C.
	H. C. McMordie, A.M.E.I.C

Niagara Peninsula Branch

R. P. Johnson, A.M.E.I.C., Secretary-Treasurer.
G. R. Taylor, A.M.E.I.C., Branch News Editor.

Power Development at Niagara Falls

About 125 members and friends sat down to dinner at the Lafayette Hotel on the evening of December 6th with F. S. Lazier, M.E.I.C., Branch Vice-Chairman in the chair. After dinner, J. L. Harper, chief engineer of the Niagara Falls Power Company, gave a very interesting illustrated address on Niagara Falls, the problems of power development there and the particular work of his own company. Mr. Harper outlined the various stages in the power development of the Falls from 14,000 H.P. twenty years ago to the 1,000,000 H.P. of the present day and he argued for a still larger development, outlining a plan whereby 60% of the water could be utilized without affecting the scenic effects.

Mr. Harper gave some very interesting information in regard to the 32 foot pressure tunnel his company has now under construction for the supply of water power for their 70,000 H.P. generators which will bring their total output up to 400,000 H.P. when they will be getting twenty horse power per cubic foot of water used instead of ten as in some of their old plants. He stated that in past years by better design of tail races and draft tubes a gain of 5% in efficiency had been effected.

Among other interesting items Mr. Harper mentioned that their transmission cable to the Aluminium Company had an area of 144 square inches and was possibly the largest in existence.

Two moving picture reels were shown, one illustrating the scenic beauties of the Falls and the other the importance of the industries at Niagara Falls utilizing power, particular stress being laid on the abrasive industries, the necessity for a large supply of electric power for their furnaces and their great importance in the whole industrial life of the country.

A very hearty vote of thanks was extended to Mr. Harper for his kindness in coming to address the Branch and for his most interesting lecture.

Hamilton Branch

W. F. McLaren, M.E.I.C., Secretary-Treasurer.

The Annual Banquet of the Branch was held in the Royal Connaught Hotel, on 24th November, 1921, at 6.30 p.m., with E.H. Darling, M.E.I.C. presiding. Brig.-Gen. C.H. Mitchell, C.B., C.M.G., D.S.O., Dean of the Faculty of Applied Science and Engineering, University of Toronto, was guest of honour, and Messrs Geo. C. Martin, Chamber of Commerce, and F.R. Close, Board of Education, were also invited. Musical selections were rendered during the evening and songs sung by the members.

Mr. Darling introduced Mr. Martin who outlined some of the activities of the Chamber of Commerce, many of which dealt with engineering problems. He said that engineers of high technical training should devote some of their talents to municipal affairs and hoped that many would become members of the Chamber of Commerce.

Mr. Close described some of the difficulties of the board of education caused by the rapid growth of the city requiring new schools with all the latest appliances for ventilation demanding the highest skill of the architect.

J. W. Tyrrell, M.E.I.C., one of the earliest graduates of the Faculty of Applied Science of Toronto, then introduced Brig.-Gen.C.H. Mitchell, C.B.,C.M.G. etc; who said that in Mr. Tyrrell's time there were 3 graduates in Civil Engineering while now there are about 57 varieties of engineers: whereas Civil used to take first place in point of numbers, now it was down to fourth place. There are over 800 students taking engineering courses. They are divided up as follows:-

Electrical Engineering	....	290
Chemical "	....	175
Mechanical "	....	160
Civil "	....	130
Mining "	....	55
Architectural "	....	32

Formerly, civil engineers were engaged on large construction work, but now we are in an industrial period requiring specialists in the scientific technicalities of the various branches of manufacturing.

The Engineering Institute combines all branches and extends from coast to coast. It is a sign of the times that all branches of engineers are getting together. Canada is essentially an agricultural country and always will be; but we must have transportation, shipping, including docks and harbours, canals, electric railways, aerial navigation, highways, water supply, sewage disposal, bridges, town planning architecture, mining as in Labrador and Northern Ontario and other parts. Then there are the great basic manufactures, iron and steel, milling, wood, cement and clay products and clothing. All these will require engineering ability more and more as time goes on. Plants employed on war work are being adapted to peace industries, as at Shawinigan where acetone is giving place to acetylene. In Saskatchewan they are now making Epsom salts and similar chemicals in place of explosives. These chemical industries will require chemical engineers. When we consider all these possibilities, we realize the complexity of engineering in its broader sense.

We engineers are not taking enough part in the affairs of the country. We are assistants to those who are running things, but we are not running things ourselves. Engineers, educated in highly endowed universities, owe it as a duty to place their special knowledge at the service of the community. They should take a more active interest in politics by serving on municipal boards and joining the Chamber of Commerce in their localities— Don't ask "What do I get out of it?," for you will get out all that you put in.

The vote of thanks was moved by H. U. Hart, M.E.I.C., chief engineer and general manager of the Canadian Westinghouse Co., and was carried amid loud applause, thus closing a most successful gathering at which over 100 engineers were present, including representatives from Brantford, Simcoe, and Dundas.

Local News

It will be noted that Mr. Hart, having resigned the Chairmanship of the branch some weeks ago, owing to pressure of work, E. H. Darling, M.E.I.C., consulting engineer, had been chosen by the executive to fill the vacancy. The cigars supplied for the dinner by Mr. Darling were greatly appreciated.

Toronto Branch

F. B. Goedike, M.E.I.C., Secretary-Treasurer.
C. R. Young, M.E.I.C., Branch News Editor.

Electricity Applied to Railway Signalling

The development of railway signalling through the application of electricity was discussed in a comprehensive manner at the meeting of the Branch on November 24 by C. H. Tillett, signal engineer for the Grand Trunk Railway. Mr. Tillett described the methods of signalling from the elementary device of the banner and lantern to the elaborate block and interlocking signalling installations now being used on first-class lines. The address was fully illustrated by lantern slides.

Social Service

At the meeting held on December 1st, Professor J. A. Dale, of the Social Service Department of the University of Toronto, addressed the Branch on "What Constitutes Social Service". According to the speaker's definition, social service consists of "the modern practice of the principles of the Good Samaritan worked out in a scientific way, as a result of centuries of experience and study".

In the discussion which followed the address, various speakers expressed their interest in the application of the principles of social service to industry and the problem of employment.

The report of the Committee on Sociology was submitted by its chairman, T. L. Crossley, M.E.I.C., who also presided at the meeting.

At the meeting of the executive held on the same evening, Willis Chipman, M.E.I.C., was named as the Branch representative on the Provincial Division.

Toronto Park System

The park system of Toronto was interestingly described and illustrated with an excellent collection of lantern slides by Chas. E. Chambers, commissioner of parks, Toronto, at the meeting on December 8th.

J. M. Oxley, M.E.I.C., Wm. Storrie, M.E.I.C., G. G. Powell, M.E.I.C., G. W. Winckler, M.E.I.C., and others took part in the discussion.

Street Illumination

A. G. Lang, of the Hydro-Electric Power Commission, gave an address on street illumination, illustrated by lantern slides, at the meeting on December 15th. R. O. Wynne-Roberts, M.E.I.C., G. W. Winkler, M.E.I.C., A. C. Oxley, A.M.E.I.C., and others took part in the discussion.

A resolution was carried by the meeting instructing the executive of the Branch to request the city authorities to have all street names illuminated.

At the meeting of the executive held on this date, G. T. Clark, M.E.I.C., Wm. Storrie, M.E.I.C., and H. J. Lamb, M.E.I.C., were appointed representatives to attend the meeting of the Provincial Division executive in Toronto on December 17th.

Students' Night, Toronto Branch

On November the twenty-eighth the Student Members of the Toronto Branch held a very successful meeting in Hart House at which about one hundred persons were present. Papers were presented by four undergraduates in a very creditable manner. A great deal of credit is due A. W. McQueen S.E.I.C., and A. M. Reid, S.E.I.C., for the organization and management of the meeting.

Mr. Reid in opening the meeting expressed the appreciation of the Student Members to the Toronto Branch of the *E. I. C.* and especially to Messrs G. J. Clark and R. O. Wynne-Roberts for their invaluable assistance.

The first paper on Railway Electrification was given by Harold S. Weldon, S.E.I.C., The history of the electric locomotive was traced, noting the outstanding

points in its development, including increased ventilation, magnetic blow-out type of controller interpole, with the consequent increased range of commutation, and also the improved mechanical construction of the motors. The advantages of railway electrification such as improved service, increased speed, and lower maintenance costs were reviewed. Mention was also made of the different systems of electrification, and of the automatic sub-stations now in use.

R. I. Wynne-Roberts S.E.I.C., then spoke on "Waste and its Possibilities" He indicated the origin of waste and defined his subject as "Waste is simply raw material in the wrong place". The speaker developing this definition, pointed out the interesting commercial evolution of waste to a product of value, and emphasized the important bearing the exploitation of waste products has upon the wealth of the nation. He illustrated his remarks by allusion to the various successful applications that have already been made in the world of industry. In his opinion the future of the waste disposal problem lies in the full scientific utlization of waste and the establish ment of a recognized market, to give all waste material definite accepted value;

The address by W. J. McLelland S.E.I.C., on water softening by the zeolite process proved very interesting. Mr. McLelland has had considerable experience both in installing and selling "Permutit" softeners so he was very conversant with his subject.

The outstanding points of this method of softening water, impressed upon all present, were the simplicity of operation, the thoroughness with which the "Permutit" removed the hardness-as demonstrated by a small working model-and the little care such a method required.

When Mr. McLelland had finished, the subject was left open for discussion, whereupon several interesting and instructive points were raised concerning the method of operation of this type of softener.

In presenting the paper on Unemployment, Mr. A. W. McQueen defined his subject as "involuntary idleness in the sphere of work for wages." He then went on to state that any attempt to solve the problem of unemployment must be preceded by a through study of the whole subject matter of economics. Western industrialism, the speaker continued, had been built up on two main ideas. First, the production of material wealth and the resultant commodities exchanged in free competition and second, that services were also a commodity to be exchanged in free competition. Unemployment is one of the evils resulting from hindering this free play of competitive forces and is caused wholley by maladjustment between wage rates and the demand for labour.

In the discussion which ensued besides several students the following took part: G. T. Clark, M.E.I.C.; R.O. Wynne-Roberts, M.E.I.C.; Professors P. Gillespie, M.E.I. C.; C. R. Young M.E.I.C.; J. R. Cockburn, M.E.I.C.

A. M. Reid, S.E.I.C., presided at the meeting.

Peterborough Branch

D. L. McLaren, A.M.E.I.C., Secretary.

The City of Peterboro has for a number of years been considering the installation of a sewage disposal plant. A difference of opinion as regards the system best suited to the needs of the City existed between the city engineer and the Ontario Board of Health.

In view of the criticism directed towards the city engineer by a representative of the latter organization at a meeting of the city council, a resolution was passed by the executive of the local Branch at a meeting held on December 5th, and the following is a copy of same:—

"Resolved, that while recognizing that the system of sewage disposal best suited to the needs of the City of Peterborough is a question of debate, we, the executive of the Peterboro Branch of *The Engineering Institute of Canada* hereby express our confidence in Roy H. Parsons, M.E.I.C., city engineer, Peterborough, knowing that he will be governed in advice to the city by scientific and economic principles only, and that a copy of this resolution be sent to the city clerk."

Automatic Stations

On Thursday Dec. 8th, G. R. Langley, M.E.I.C., switchboard engineer, for the Canadian General Electric Co., Ltd., gave an address to the local Branch on "Automatic Stations". The speaker dealt with automatic stations both of the railway and hydro-electric type and showed conclusively that the equipment for such stations is not complex as commonly believed, but perfectly standard in every respect.

Kingston Branch

L. T. Rutledge, M.E.I.C., Secretary-Treasurer.

Life of Sir Sandford Fleming

A regular meeting of the Branch was held in Convocation Hall, Queen's University, on November 22nd. at which Professor Peter Gillespie, M.E.I.C. of the University of Toronto gave a very interesting address illustrated with lantern slides on the life and career of Sir Sandford Fleming, an eminent engineer and a late chancellor of Queen's University.

Prof. Gillespie reviewed many of the details of the early life and education of Sandford Fleming. He then dwelt at length on the pioneer work done by him along with other noted men in the development of the Great West at the time when the Canadian Pacific Railway was being surveyed and afterwards constructed. The speaker enumerated many instances of hardship and privation met with in the mountain fastness where the snow was so deep and the cold so intense. Sir Sandford laboured with untiring energy as a chief engineer during the years of the construction of the railway roadbed and it was interesting to note that he was present at the ceremony of driving the last spike on the mountain division. The picture which illustrated this ceremony showed Sir Sandford standing beside two honored empire-builders known to us as Sir William Van Horne and as Lord Strathcona.

The strong personality, the steadfastness of purpose, the adherence to principles of right, the honesty, integrity and the high moral character of the man were characteristics well brought out and illustrated by the speaker. The impression left on the mind of every person was that Sir Sandford Fleming's name occupies a high position in the list of those great men who have been the ornaments and benefactors of the Canadian race.

Iron Ores of Canada

The next meeting of the Branch was held on December 13th., at which meeting Prof. Stanley Graham, professor of mining engineering, Queen's University, gave a very instructive paper on the "Iron Ores of Canada". Prof. Graham treated the subject in a logical order as is revealed by the following synopsis:-

1. History of the development of iron mining in Canada with statistics and comparisons with other iron ore producing countries.

2. Iron ore and its impurities. The conditions effecting the value of it as a marketable product.

3. Value of Canadian ores in comparison with our U. S. competitors.

4. Treatment of low grade ores to make them marketable.

5. Concluding discussion on the probable future of the Canadian iron ore industry with suggestions as to means that might be used to stimulate the industry.

The speaker explained in the first place, the great and vital importance of the iron industry in any country. Then he showed how Canada had enormous iron ore resources widely scattered from the Atlantic to the Pacific. But though Canada has many ore beds and mines such as the Helen mine that produce in their natural state ores that are marketable, nevertheless, on the whole most of the ores require beneficiating before the furnace people will purchase them. Up to the present it has been possible to meet the demand with rich ores in the natural state and most of this ore has come from the United States Lake Superior district.

Prof. Graham, after showing in detail the true state of affairs, gave some interesting details as regards beneficiating iron ore and showed a bright future for Canadian ores when ores have to be treated universally. It is known that the tonnage of high grade U. S. ores is rapidly decreasing and consequently the value of U. S. ores is a diminishing quantity whereas relatively with our industry practically at a standstill the value of the Canadian ores is an increasing quantity. As soon as the United States companies have to begin treating their ores and this has already begun on a large scale in the Superior district, then the Canadian companies will be able to compete with their near-ores. Much research work has to be done to stimulate the Canadian iron industry and it is quite apparent that the Canadian government should assist in some measure. Stimulating the iron industry helps many other industries and consequently is a general benefit.

A very hearty vote of thanks was tendered Professor Graham for his excellent address.

Ottawa Branch

F. C. C. Lynch, Associate E.I.C., Secretary-Treasurer.

The Modern Telephone System

At an open meeting of the Branch on the evening of the 24th November, held in the Victoria Museum, N. M. Lash, B.Sc., chief engineer, Bell Telephone Company of Canada, Montreal, gave an interesting and instructive address on "The Complex Nature of a Modern Telephone System". The points covered by the address included:— Switchboards, effect of increasing the number of lines, importance of planning for the future, long distance, complexity of same, replacement of open lines by toll cables, transmission, effect on design, repeaters, etc. The lecture was illustrated with lantern slides and two reels of moving picture films, the first one showing the make-up of a telephone system and the other the progress of telephone installation, training and working of operators, closing with the progress of a call from Montreal to Vancouver. A large audience listened appreciatively to the lecturer and viewed with approval the interesting films.

The E.I.C. and Its Branches

The growing importance and usefulness of local branches of *The Engineering Institute of Canada* as shown by the dependence, more and more being placed on them by municipalities was strongly emphasized in an address delivered at the Ottawa Branch, *Engineering Institute* luncheon by J. M. R. Fairbairn, D.Sc., M.E.I.C., chief engineer of the C.P.R., and President of *The Engineering Institute of Canada.*

In opening, Mr. Fairbairn called attention to a recent speech of Lord Byng of Vimy, delivered in Toronto, in which the Governor General had stated that the future of Canada lay more and more with men of science. Prof. Macallum had also voiced the same sentiments when speaking on China, when he remarked that the future of China depended on the scientific education of its young men. It was common knowledge to the engineer, said Mr. Fairbairn, that the development of past ages was due to scientific attainments. People in other walks of life were beginning to appreciate this.

After tracing the development and growth of *The Engineering Institute of Canada* down to the present, with its 4,500 members and 20 different Branches from coast to coast, Mr. Fairbairn said that with the livened, energetic interest that had been developed, there had been engendered a keen interest by local Branches in civic affairs, that could not help but be of benefit to the public. This stimulation of interest in public affairs, and the improved ability of members of *The Engineering Institute* Branches to discuss civic matters of interest to engineers, were two of the outstanding accomplishments of local Branches, which Mr. Fairbairn considered were of the greatest importance.

A number of local Branches had got in touch with their municipalities and had been asked by them to assist in the solution of problems of interest to the municipalities. Another thing, which the speaker had noticed as a result of formation of Branches, was that engineers were able to get up and express themselves much better. Mr. Fairbairn said he had often been impressed by the ease with which labour men were able to make speeches on any matter, and he thought it was due to the practice they obtained in the lodge rooms. In the same way the Branches of *The Institute* should enable the cultivation of easy speech by the engineers. The latter often excused themselves by saying they were better at doing things than at talking.

The speaker believed that soon the Provincial Governments would be asking the advice and assistance

of *Engineering Institute* Branches in the larger centres, and the day was perhaps not far distant when even the Federal Government could obtain assistance from *The Engineering Institute* headquarters.

Mr. Fairbairn also stressed the importance of professional ethics among engineers, in their relations with one another. After all, these consisted only of the exercise of true courtesy to one another, one great body boosting one another.

If the thought of Lord Byng was to be fulfilled, each engineer must be willing to give his best ungrudgingly, realizing that in their attitude to each other, engineers could do the most good and be of the greatest value in the development of Canada's resources.

Short addresses were made by J. H. Hunter, A.M.E.I.C., Chairman of the Montreal Branch, who said "there was nothing engineers could not accomplish", and by George Mountain, M.E.I.C., chief engineer of the Railway Commission who said he felt sure that *The Engineering Institute* would be invited to give advice to the Federal Government on engineering matters.

The luncheon was presided over by C. P. Edwards, M.E.I.C., Chairman of the Ottawa Branch, who referred to the healthy state of the Ottawa Branch, which had 350 members to-day and $1,600 in the treasury.

Montreal Branch

J. L. Busfield, A.M.E.I.C., Secretary-Treasurer.

Canadian Authors' Week

On Thursday November 24th, in recognition of Canadian Authors' Week, the usual technical paper was abandoned, and the Branch went in for literature with historical and reminiscent talks on Canadian and other authors.

Col. George Ham of the Canadian Pacific Railway was the speaker of the evening, and the Chairman was J. M. R. Fairbairn, M.E.I.C., chief engineer of the C.P.R., President of *The Institute,* who briefly introduced Col. Ham.

Col. Ham's address was in the nature of a humorous anthology of Canadian authors and authoresses during the past half century, with whom he had been personally connected. He began many years back with reminiscences of D'Arcy McGee, whom he eulogized as one of the most brilliant speakers and writers Canada has ever known.

From this, Col. Ham proceeded to some sketchy reminiscences of his intimacy with Mark Twain and his personal associations with such writers as Robert Service, Hon. Frank Oliver, "Jack" Cameron the "Kahn", well known for many years as a newspaper and magazine writer, Augustus Bridle, accused of writing "The Masks of Ottawa"; Col. George T. Dennison of Toronto; "Billy" Moore of the Canadian Northern, who wrote "The Clash"; Hector Charlesworth of Toronto; E. King Dodds, H. F. Gadsby, John Munroe, E. W. Thompson and other Ottawa press gallery writers; Wilfrid Campbell, Bliss Carman, Col. E. J. Chambers, Irvin Cobb, Professor Stephen Leacock, Dr. Drummond and many others.

"But make no mistake" said Col. Ham, "we have good writers in Montreal, most of whom it has been my privilege to know. Such men as Cy. Warman, John Murray Gibbon, Hector Garneau, W. D. Lighthall, Frank L. Packard, George Iles, B. K. Sandwell, William Hunt, Arthur Dansereau, John Reid and Martin Griffin, whose works for so many years adorned The Montreal Gazette, and R. S. White who today yields so trenchant a pen on that journal."

Turning to the women writers of Canada he had known, Col. Ham said there was quite a bevy of them, from "Kit" of the Toronto Mail and Empire; "Françoise" of Montreal; Mrs. Fenwick Williams; "Janey Canuck", Nellie McClung and others.

During the evening a number of recitations from the works of Dr. Drummond and Robert Service were given by Messrs. J. Bevan Giles, R. Roberts, and C. Godwin.

Montreal Aqueduct

On December 1st, F. Y. Dorrance, A.M.E.I.C., division engineer of the Montreal Water Board presented the second of the series of papers on the Montreal Aqueduct dealing with the engineering features. H. W. Fairlie, A.M.E.I.C., presided.

Einstein's Theory

On December 8th, Professor Lewis T. Rutledge, A.M.E.I.C., of Queen's University, Kingston, gave an interesting lecture on Professor Einstein's Theory of Relativity and Gravitation. Prof. H. M. MacKay, M.E.I.C., presided. Professor Rutledge's address has already been published in the Kingston Branch news, so it will suffice to say that the address was found of absorbing interest.

Annual Meeting, December 15th, 1921

The British Government Commercial Intelligence System.

On December 15th, G. T. Milne, the Senior British Trade Commissioner in Canada and Newfoundland, addressed the Montreal Branch of *The Engineering Institute of Canada,* taking as his subject "The British Government Commercial Intelligence System".

In outlining the origin of this form of government assistance to trade, the lecturer pointed out that, in the days when Britain, as the pioneer industrial country of the world, held, almost without challenge, the position of being practically the only country exporting manufactured goods, and when her customers placed their orders through London merchants, there was not the same need for a government-supported Commercial Intelligence System as nowadays when the manufacturers of the United Kingdom have to meet the competition of highly developed countries, such as the United States and Germany. The speaker also thought that the development of a Commercial Intelligence System by his Government was in line with the modern conception of the relation of the state to the individual. Formerly, he said, the trader exporting to countries overseas considered himself more or less self-sufficient, and while this school has still exponents, its members are diminishing, and experience has shown that even the largest firms of manufacturers

find it to their advantage to consult the Department of Overseas Trade in London with regard to their export trade.

After briefly explaining the organization of the Commercial Intelligence Service, Mr. Milne emphasized that it was not the function of a government department or its overseas officers to secure orders, but rather to indicate where opportunities for doing business occur, and by bringing buyer and seller together. His function as a Trade Commissioner was to supplement existing activities of the ordinary merchant and trader, and in no sense to take their place.

Mr. Milne paid a tribute to the work being done by Canadian Trade Commissioners in different parts of the world which he had visited, adding that Canada had appointed Trade Commissioners before Great Britain had. He considered that the explanation of this was to be found that, in a new industrial community such as Canada, whose traders had not yet established business connections in the world's markets, the most convenient method of investigating possibilities was by means of a Trade Commissioner knowing what his country could export. In countries where Canada is not represented by a Trade Commissioner, Canadian importers and exporters may utilize the services of British Consuls. These services, which are being made use of extensively, do not cost the Canadian taxpayer a single cent.

Before concluding, Mr. Milne referred to the forthcoming Eighth Annual British Industries Fair, which is organized by his Department in London, and mentioned that these Fairs has been instrumental in securing orders for British manufacturers running to millions sterling. Buyers flock to this Fair from all parts of the civilized world, and as showing its extent, Mr. Milne mentioned that the alley-ways in the Fair Building, occupied by exhibitors, extend to some miles in length. Wide publicity for the Fair has been obtained throughout the Dominion, and it is hoped that a large number of buyers representing Canadian importers will visit the Fair.

Time did not permit of more than a passing reference to the Export Credit Scheme devised by the British Government with the view of helping Britain's export trade. Under this scheme twenty-six millions sterling has been ear-marked for this purpose. Although originally devised with the view of assisting in the rehabilitation of Central Europe, the scheme, as now amended, applies to the whole world.

Mr. Milne extended an invitation to the members of *The Institute* to make use of the facilities of the Trade Commissioners' offices in all matters regarding trade with the United Kingdom.

The Annual Meeting was opened with the Chairman, J. H. Hunter, M.E.I.C., presiding, and the Secretary announced the election of the following officers:—

Chairman, J. A. Duchastel de Montrouge, M.E.I.C.

Vice-Chairman, John T. Farmer, M.E.I.C.

Committeemen, R. Bickerdike, M.E.I.C., C. J. DesBaillets, M.E.I.C., P. B. Motley, M.E.I.C.

A brief discussion was held on Branch Finances, and it was decided to ask every Member of the Branch to make a voluntary subscription, not exceeding $5.00 per member in order that the activities of the Branch may be carried on, and also a reserve fund built up.

Following the business session, a musical programme was provided, with Chas. M. McKergow, A.M.E.I.C., acting as master of ceremonies. Messrs. Busfield and Swan contributed vocal numbers, and Mr. Lamontagne gave a cello solo, which was greeted with very hearty applause. Light refreshments were served during the evening.

J. A. Duchastel de Montrouge, M.E.I.C., the new Chairman of the Montreal Branch of *The Institute* was born in New York in 1878, his father being the French Consul at that place. He was educated at Public Schools in Quebec, Amsterdam, Paris, Rheims, and entered the Ecole Polytechnique, (Laval University) in 1897, obtaining the Degree of Bachelor of Applied Science in 1901. For a few years Mr. Duchastel was connected with, first, Phoenix Bridge & Iron Works, the Canadian Pacific Railway, and Messrs. George and Vautelet. In 1906 he became city engineer of Outremont and from 1918 to date he has occupied the position of city engineer and manager of the City of Outremont.

Mr. Duchastel has been very active in *The Engineering Institute of Canada*, becoming a Student Member in 1899, an Associate Member in 1904, and a Member in 1912. He is also known as the president of the Automobile Club of Canada, vice-president of the American Road Builders Association, director and past president of the Canadian Good Roads Association. He is a Member of the Engineers' Club, of the Montreal Board of Trade, and the Chambre de Commerce Française.

John T. Farmer, M.E.I.C., the newly elected Vice-Chairman, was born in Liverpool, England, in 1874. He took the degree of B.Sc. and M.Sc., from Liverpool University in 1894, and was awarded the Exhibition of 1891 Scholarship for research entitling him to study abroad for two years. These years were spent at McGill where he graduated with the degree of M.Sc. in 1897, and later, in 1894, he was awarded the degree of Doctor of Science.

Mr. Farmer spent a number of years in the States with the Crosby Steam Gauge and Valve Company, the Ball and Wood Company of Elizabeth, New Jersey, Watts Campbell Company, Newark, New Jersey, and the Green's Economizer Company of New York, while since 1905 he has been the local Sales Engineer and Representative of a number of engineering firms in Montreal, including Glenfield and Kennedy Limited of Kilmarnock, Drysdale and Company of Glasgow, the Combustion Engineering Corporation of New York, also district manager of Green's Economizer Company of Canada.

Mr. Farmer was awarded the Gzowski Medal of *The Engineering Institute* for his work on impulse water wheels in 1898, and has been consulting engineer connected with a number of hydraulic installations.

C. J. DesBaillets, M.E.I.C., is a native of Geneva, Switzerland, and is a graduate of the University of West Switzerland. He came to Montreal in 1904, since when he has been connected with the Shawinigan Water and Power Company, the Structural Steel Company, the

Canada Paper Company, and the Canadian Westinghouse Company. In 1917 he was appointed manager and chief engineer of public utilities for the Corporation of Sherbrooke. In May 1920, Mr. DesBaillets joined the Montreal Water Board as engineer in charge, and has since that time been intimately connected with the carrying out of the Montreal Aqueduct. He became an Associate Member of *The Engineering Institute* in 1917 and a Member in 1920.

P. B. Motley, M.E.I.C., was born in India in 1871, and obtained his engineering education at the School of Practical Engineering in London, England. He has been continuously in the service of the Canadian Pacific Railway since 1892, commencing as a draughtsman under the late P. A. Peterson, and later occupying position of engineer in charge of bridge construction, assistant engineer in charge of design of bridge renewals, and at the present date, engineer of bridges. Mr. Motley became an Associate Member of *The Engineering Institute* in 1898, and a Member in 1905.

Robert Bickerdike, M.E.I.C., is a graduate of McGill University, and has spent a number of years on Railway construction work, and with the Department of Public Works on hydrographic surveys. From 1908 he was connected with the Transcontinental and Canada Central Railways. From 1912 until this year he was with J. H. Hunter and the Canada Starch Company in various capacities, except during the war. He went overseas with the 87th Battalion and returned with the rank of Lieutenant-Colonel. He was awarded the D.S.O. and Bar. At the present time he is in private practice.

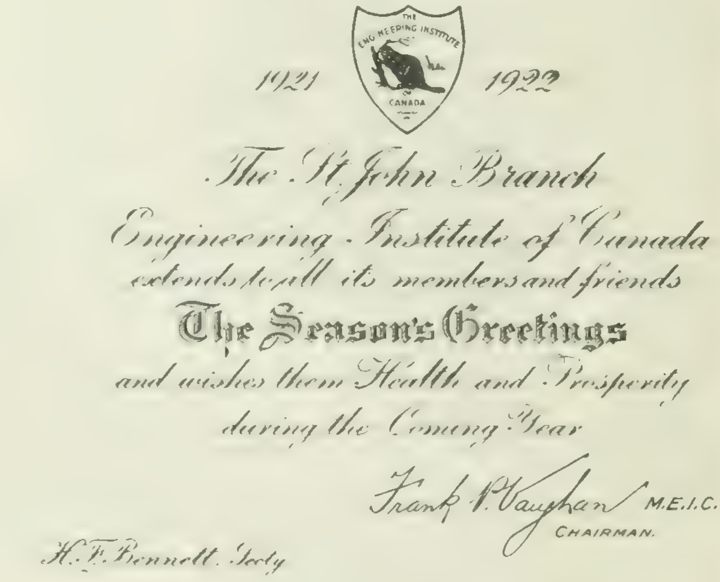
St. John Branch

Harry F. Bennett, A.M.E.I.C., Secretary-Treasurer.

Musquash Power Development

The members of the Branch had a splendid opportunity of seeing the works at the Musquash Power Development on Saturday, Dec. 10th, when they were the guests of the New Brunswick Contracting and Building Co., Ltd., general contractors on the concrete and earthwork sections, at luncheon, and afterwards visiting the various works under the direction of Herbert Phillips, M.E.I.C., managing director of the company, and S. R. Weston, A.M.E.I.C., asst. chief engineer of the Power Commission. The thirty-five members who motored down from the city, thoroughly enjoyed the splendid luncheon, and were impressed with the various works carried out under the direction of C. O. Foss, M.E.I.C., chief engineer of the N. B. Electric Power Commission.

The Musquash River, at the point of development, is 13 miles West of the city of St. John; it has a total watershed above the main dams of about 350 sq. miles, and the turbines are designed for a maximum load of 11,100 H.P. The river itself is small but the numerous lakes in the system, assisted by the increased pondage, will give sufficient water to keep the plant in continuous operation. The water is carried to the power house by an 8-foot wood stave pipe, 7,400 feet long from the main dam on the West Branch, and by a 10-foot wood stave pipe, 3,000 feet long from the main dam on the East Branch, the static head in the former being 128.5 feet and in the later, 103.5 ft.



St. John Branch Christmas Card.

The main dams are of concrete, with earth sections with a concrete core wall. Smaller earth dams are constructed to retain the flowage. On the upper stretches of the river, timber and earth dams have been constructed to increase the storage capacities of the larger lakes. The two intake houses and the power house are of concrete construction, the power house being located at the head of tide water. The turbines consist of two vertical turbines of 3,670 H.P. and one of 3,760 H.P., the generators consist of three 2,900 K.V.A. units.

The power will be delivered at a sub-station on the outskirts of the city of St. John. Steel towers have been erected on concrete foundations to carry the aluminum transmission cables, the longer spans of the cable are steel reinforced.

The first field work on this project was done in July 1920, the first contract let Nov. 9th, 1920, and at present, 95% of the work is completed. Surveys for a transmission line are now being made to Moncton, 90 miles east of St. John.

The contractors for the various works are as follows:—

Earthwork and concrete:—The New Brunswick Contracting and Building Co., Ltd.

Wood stave pipe line:—The Pacific Coast Pipe Co.

Hydraulic installations:—S. Morgan Smith Co.

Electric installations:—The Can. Gen. Electric Co.

Transmission line—clearing right of way:—The Maritime Construction Co.

Towers and erection:—The Canadian Bridge Co.

The regular monthly meeting of the Branch was held on Dec. 15th. A resolution was adopted endorsing the proposed meeting of the Branch Secretaries in January.

The Chairman, F. P. Vaughan, M.E.I.C., explained to the meeting that the Mayor of St. John had asked three members of *The Institute*, Messrs. C. C. Kirby, M.E.I.C., W. G. Chace, M.E.I.C., and G. G. Hare, M.E.I.C., to report on the distribution of the power available from Musquash. Their report had been published and considerable discussion had taken place. He felt that it was up to the city to find a market for the power which had been brought to our doors by the Power Commission and was offered to the city at 1.2 cents per K.W.H.

W. G. Chace, M.E.I.C., then addressed the meeting and explained the various options which offered for the disposal of this available power. He explained, that, with the exception of the several large users, the N. B. Power Company was supplying the city's electricity, as well as gas, and operating the electric railway. The charges for power were high, but various audits had shown that the profits were small. The committee, of which he was a member, recommended that the city and power company might unite in a contract with the Power Commission, the energy being purchased for distribution by the company. He felt that this could be done in such a way as to give the citizens the benefit of any economy.

C. O. Foss, M.E.I.C., then explained the policy of the Power Commission in the matter. They were willing to sell their power at cost, the 1.2 cents per K.W.H. was a maximum price and if it were possible it would be reduced. The commission had spent considerable money on these projects and were ready to go further in the development of power. They want the power distributed to the advantage of the citizens and prefer selling to Municipalities.

Considerable discussion took place after the addresses. opinions differing as to the best method of distribution. Since this meeting the power question has received considerable attention and is being seriously debated by the citizens at large.

Moncton Branch

M. J. Murphy, A.M.E.I.C., Secretary-Treasurer.

Natural Gas

The regular monthly meeting of Moncton Branch was held in the Supreme Court Chambers, Moncton, Wednesday evening, November 23rd. J. D. McBeath, M.E.I.C., Chairman of the Moncton Branch and asst. city engineer presided. The speaker of the evening was Dr. J. A. L. Henderson of London, England, president of the N.B. Gas and Oilfields, Ltd.

In beginning his address, Dr. Henderson told of the difficulty of classification of natural gases. Bituminous materials are divided into three great classes, pure bitumens, pyro-bitumens and artificial bitumens. In the pure bitumens are included all from gaseous to solid. Besides what is known commercially as "natural gas" i.e. petroleum gas, there are other gases in nature as for example natural coal gas and gases associated with igneous rocks in volcanic areas and steam.

Natural gas is used for domestic purposes for light, and for heating purposes, cooking, hot water and individual stoves, but should not be used for general house heating. It is used for industrial purposes for gas engines and boilers. It is now considered unwise from the national standpoint and for the consumer's own benefit to use it for heating of houses, on account of waste. Use under boilers is extremely wasteful. Four to five times the amount of gas is consumed to get the same relative efficiency. For smelting, baking bricks and tiles, and for the production of lamp black it should not be used, although in the United States 51,000,000 lbs. of lamp black was produced in 1920 from natural gas, chiefly in districts where the gas is so distant it cannot be used for any other purpose.

Speaking of the waste of natural gas, Dr. Henderson stated that it is estimated that in 1920 in the United States the waste was at the rate of 800 billion cubic feet per annum the equivalent of 20 million tons of high grade gasoline. This waste is incurred in production, distribution and in mis use.

Figures for 1911 show that 11,132,642 acres are held in the United States for exploitation purposes while 1918 figures give over 14 million acres. The acreage held for petroleum exploitations purposes in 1911 was over 8 million acres. On an equivalent basis of gasoline at 20 cents per gallon the natural gas would exceed the petroleum in value by 40 to 50 per cent.

The relative value of natural gas to a nation as compared with petroleum from the standpoint of value in quantity and area is equal if it does not exceed that of petroleum. Its drawback is that it can be used at present only in the country in which it is found. Pipe lines of 400 to 500 miles in length are probably the extreme limit of distance to which it can be conveyed. Natural gas is at the mercy of the country within which it is found. The community should interest itself in controlling the use of it not only for its own benefit but also for the use of posterity.

Over 95 per cent. of the known natural gas is produced in the United States. Canada comes next with 2 per cent; Russia, Galicia, Roumania and Italy follow consecutively. Natural gas is chiefly found in sedimentary rock mostly sandstone and limestone. It has been accumulated from the earliest time to now from the carboniferous rock period downwards. The largest initial flows of gas were found in Louisiana running from 40 to 75 million cubic feet and in California where a flow of 100 million a feet was struck, the pressures varying from 1500 to 2000 lbs. per square inch. The deepest well from a productive standpoint is the Liganier well near Pittsburg. It is over 6000 feet deep, averages 500,000 cubic feet and the pressure is too great to measure. The deepest well in the world is the Lake well in West Virginia, sunk in 1919 at a cost of $150,000. This went to a depth of 7,579 feet at which depth a temperature of 168 degrees Fahrenheit was encountered. This well failed to produce profitable gas.

After tracing briefly the early history of natural gas during which he stated that the Chinese and Phoenicians and Fire-worshipers along the Caspian Sea and others cognizant of it, the speaker said the present commercial development dated back only about 40 years. Canadian production commercially began in 1890 with a value of

$150,000. In 1910 the value had increased to $1,491,249. Since then there has been large expansion in Alberta and New Brunswick. One company alone in Alberta sold almost four billion cu. ft. yearly over more than 8 years.

In speaking of our Canadian fields in particular, Dr. Henderson dwelt on the need for conservation. The average life of a gas well is ten years and after the present supply is depleted there is no renewal to the wells. Some of the causes of uncurbed use of it, are too much use for industrial purposes and too low a price.

Dr. Henderson stated he was formerly of the opinion that government control of the natural gas resources was preferable but is now of the opinion, because of danger of depletion of the fields, that private ownership under regulation is better. To replace the 660 billion cubic feet of natural gas used in the United States in 1920 would require an expenditure of $1,200,000,000 for other fuels.

In closing, the chairman tendered Dr. Henderson a hearty vote of thanks for the clear and concise manner in which he presented such an excellent address on so intricate a subject.

Cape Breton Branch

Kenneth G. Cameron, A.M.E.I.C., Secretary-Treasurer.

Low Carbon Steels

A regular monthly meeting was held December 9th, in the Branch rooms at Sydney, there being about thirty members present when the meeting was called to order by the Chairman, C. M. Odell, M.E.I.C. The business of the evening was a paper by W. S. Wilson, A.M.E.I.C., on "Some interesting features relative to the properties, heat-treatment, and working of low carbon steels".

Mr. Wilson in opening, emphasized the fact that the breadth of his subject was such that he could only select a few of the more interesting characteristics, dealing with these from the viewpoint of our local problems, rather than from a highly technical attitude.

We might consider, he said, that modern civilization had its beginning with the intensive manufacture of steel, and it is certain that all our scientific discoveries can only be turned to public service and profit through the development of materials of engineering which will stand up to test,—we can see therefore the necessity of thoroughly acquainting ourselves with the properties and possibilities of those materials we have.

Dealing briefly with the microstructure resulting from the natural cooling of molten steel, Mr. Wilson illustrated the different characteristics of the constituents by an excellent microphotograph,—1000 diam. magnification,—of a piece of steel the surface of which had been scratched by a needle, the varying width and depth of the scratch showing clearly the difference between the soft and hard parts.

Mr. Wilson then gave some details of a recent discovery, in which the treatment of microscopic specimens by a new reagent deposits a thin film of copper on the purer steel as opposed to those portions containing segregated phosphorus, thus developing a pattern corresponding to the distribution of the phosphoric areas. Successive illustrations of an ingot, bloom, billet and bar treated in this manner, showed very clearly the effects of rolling and work done upon the steel. By means of this method of microscopic examination of steel, it is also possible to determine whether a failure is due to bad design or defective material.

An illustration of an ingot in which pieces of high manganese steel had been embedded regularly, and which was then drawn down in a hydraulic press, showed the irregularities resulting from this type of working as compared with that of a rolling mill.

Mr. Wilson then followed through the changes known to take place during the heating of steel, and the widely differing results obtainable by varying the heat-treatment, and dealt in particular with the results which might be expected from the recent installation by the Dominion Iron and Steel Co. of a rail bloom reheating furnace. He also emphasized the fact that properly heat treated carbon steels were taking the place of the more expensive alloy steels which came into use so largely a few years ago. The following table is an illustration of what we can do with our own home product, properly heat treated:—

	.8% carbon Steel, heat treated.	1.11% vanadium Steel, as rolled.
Elastic limit........	139,000 lbs.	121,000 lbs.
Breaking stress......	178,000 lbs.	172,500 lbs.
Elongation in 2"....	14%	10%
Reduction in area...	43%	17.6%

At the close of the paper considerable discussion took place, the subject being of strong local interest,—and at its conclusion, Mr. Wilson was accorded a very hearty vote of thanks.

Halifax Branch

O. S. Cox, A.M.E.I.C., Secretary-Treasurer.

Town Planning

The regular monthly meeting of the Branch was held at the Green Lantern, December 19th. Attendance, 42. C. E. W. Dodwell, M.E.I.C., Chairman of the Branch, presiding. Supper was served at 6.30 P.M., after which the meeting was called to order. H. W. Johnson then presented a very valuable paper on Town Planning. Mr. Johnson explained that the subject was too large to attempt to cover it fully in one evening. He touched on several phases of the subject, however, and many interesting features were brought out.

The following is an incomplete resumé of some of the points made by Mr. Johnson:—

A Town Planning Scheme is a means of providing for convenience, safety, service, contentment, health and progress. Intelligent planning saves the expenditure of large sums of money in spasmodic and costly attempts to keep pace with the growth of a city. Growth means expansion, change and new conditions. A town and its urban areas should be planned to provide for such future expansion. Transportation must be rapid and convenient and street systems must be provided to give a maximum

of ease and rapidity of movement. Street requirements are constantly changing, since growth brings increased traffic with increased freight tonnage. The rectangular layout of streets is the most common and has the advantage of economy and simplicity but has the disadvantage that the best grades cannot be obtained and it does not admit light and air freely. The diagonal or radiating system gives convenient, quick access from distant points to centre of the city but has the disadvantage of causing oblique street angles and loss of area.

Town Planning is comparatively modern and the majority of cities have grown up without any preconceived plan or layout and are unable to adequately cope with rapid growth and changing conditions. Many cities have adopted town planning in later years and while not getting the full benefit possible, are able to correct many existing evils and to provide for further growth and expansion. Halifax and Baltimore are examples of cities which have taken advantage of great civic disasters to introduce town planning for rebuilding devastated areas. In the case of Halifax, the area devastated by the explosion in 1917, which previously had a rectangular system of narrow streets, with grades of from 13 to 20%, has been rebuilt with wide streets, boulevards, parks and a modern aesthetic type of buildings. The maximum street grade in the rebuilt district is 5%.

A zoning law is a power whereby a city controls the character, use, height, location, etc., of its buildings. It provides districts for offensive industries; it segregates business and residential areas, regulates the location of homes at convenient distances from work, allows for a proper and sanitary admission of light and air and tends to make for better health, greater happiness and for the general betterment of the whole community. From the restrictions provided by a zoning law, values become stabilized and in consequence, investments give a more stable and more certain return.

The paper was followed by a good discussion by various members and guests of the Branch.

Mr. Murdoch extended an invitation to the Branch to attend the regular monthly meeting of the N. S. Electrical Association which was then in session in the adjoining room. Our meeting adjourned at 9.00 P.M., and gratefully accepted this kind invitation. A very pleasant hour was spent with the Electrical Association, who provided a very interesting programme of music and motion pictures.

Halifax Branch

Programme for the Season 1921-1922

October

Reconstruction in France after the War.
Prof. F. H. Sexton,
Principal of N.S. Technical College.

November

Tramway Engineering.
By I. P. MacNab, M.E.I.C.

December

Town Planning.
H. W. Johnson,
Assistant City Engineer.

January

Some Problems met with in Local Building Construction.
C. St. J. Wilson, A.M.E.I.C.

February

A Lump of Coal.
K. L. Dawson, A.M.E.I.C.

March

Engineering Underground in France.
R. R. Murray, A.M.E.I.C.

April

Some Problems met with in Surveying.
H. B. Pickings, A.M.E.I.C.

May

The Work of the Municipal Engineer.
F. W. W. Doane, M.E.I.C.

In addition to the above, there are several interesting papers in view, with uncertain dates.

Members will receive timely notice of each meeting.

Town Planning Notes and Comments

H. L. Seymour, A.M.E.I.C.

NOTE: — *In order to make this column of wide interest to members of The Institute, personals and items of town planning interest will be appreciated. Address: H. L. Seymour, A.M.E.I.C., 40 Jarvis Street, Toronto.*

Short Course in Civics and Town Planning

The two weeks Extension Course in Civics and Town Planning at Toronto University during January is an interesting experiment. It presents several unique features, that might well be reviewed at some length in this column.

The course is open to the public as well as students, at a purely nominal fee. It is expected to fill, in some measure at least, a long felt want. Some day, and probably some day soon, there will be full and regular town planning courses in our Canadian Universities. The next generation of town planners will be trained and equipped as our engineers and architects now are, at our Universities. But at present there are many interested in the subject of town planning and municipal development, who wish to have their reading intelligently directed and stimulated. To those technically interested in town planning, the course offers an opportunity for mutual betterment.

The course as announced is to consist principally of lectures and discussions and if time permits of work on actual problems. Evening discussions of actual or theoretical problems may be arranged, if the class so desires. Saturday afternoons may be utilized for visits to points of interest. Those from localities outside Toronto have been invited to bring maps or plans of their district, together with particulars of the circumstances surrounding any problem which happens to be interesting them. It is hoped that in this way the actuality of instruction and discussion may be augmented

and solutions of real problems, in some cases, found.

The lectures have been divided under four general headings: — Economic, Sociological, Technical and Administrative, and may be briefly described as follows:—

Economic

The economic aspects of urban growth and concentration with and without civic control, in relation to housing, land, agricultural and industrial development, taxation, transportation and finance.

Costs and values in municipal development; examples drawn from original investigations in Canada.

Results of the Ontario Housing Loan Policy.

Sociological

The relation of overcrowding and underhealth; reactions of housing environment on characted and physique, and mortality rates.

Education and recreation. The interaction of these and their place On the plan, whether urban or rural.

The organized suburb and the satellite town, with examples drawn from present-day effort and achievement in England.

The larger aspects and ideals of civics as the gathering of knowledge on which a wide plan, town plan, country plan, for the improvement of the quality of human living can be based.

The study of one particular community in Ontario. Its growth and prospects. Its delimiting conditions and its opportunities. The lessons of such a study.

The History of Toronto as to maps and plans.

Technical

Maps and plans and map reading. Canadian maps. Varieties of notation in plans of towns.

Roads and pavements. Location, grades and various methods of construction.

Sewers and drains — How the work under ground, without which the modern city would be uninhabitable for modern people, is planned and built and how it functions. Its effect on the health of communities, with statistics compiled from Canadian examples. The ways in which the drain and sewer plan guides or should guide the general plan of a small subdivision or a great city.

The original survey and its effect on the town plan.

Planning for sunlight and for other meteorological conditions.

Zoning, or the segregation of the various districts of a town. The Idea. Examples at work.

Transport to the city and transport within. Its means, problems and effects.

City parks, gardens and open spaces. The proper utilization of ravines and bad ground. Treatments for boulevard and front lawns and the kind of trees suitable to these.

An account of the Provincial Government's scheme for Kapuskasing. The climatic, geographical, social, industrial and incidental limitations of the problem and its solution.

Varieties of street sections. Widths and heights. Boulevard — terraced street, etc.

The placing of public buildings and the civic centre idea.

Where the architect comes in. Examples great and small of civic architecture and the effects attainable by the right architectural treatment of buildings including even those not under civic control.

Administrative

Civic government under the four headings:

(a) What is a municipality?

(b) The mayor, city council plan.

(c) The commission form of government.

(d) The council or commission-manager plan.

With a discussion of the effects and defects of the forms of civic government used in North America.

The law in Ontario to-day regarding town planning and housing.

Ways and means; or how even under existing laws, town planners' ideas may be put into effect.

The classes will be welcomed and addressed by Sir Robert Falconer, president of the University, Brigadier-General C. H. Mitchell, M.E.I.C., dean of the Faculty of Applied Science and Engineering, and J. P. Hynes, A.M.E.I.C., president of the Ontario Town Planning and Housing Association.

Prof. Adrian Berrington, Department of Architecture, who has been responsible for the preparation of the course, each day will lead the classes in general discussion of the day's work. Among the seventeen lecturers, University professors and external authorities, there are several corporate members of the E.I.C., from Ottawa and Toronto.

It is hoped to present as part of this column in succeeding months, a review of the lectures.

Preliminary Notice

of Applications for Admission and for Transfer

21st December, 1921

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate member a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility o each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in January, 1922.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option, Railway, Municipal, Hydraulic, Mechanical, Mining or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidat. has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years oe age, and must have been engaged in some branch of engineering for at least four yearsf This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects, Geography, History (that of Canada in particular), Arithmetic, Geometry Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits cientific acquirements, or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

> The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

AINSLIE—CHARLES MILLS, of Poona, India. Born at Mintlaw, Aberdeenshire, Scotland, April 4th, 1886; Assoc. Member, Aberdeen Assn. Civil Engrs.; Educ., C.E. course, Gordon Tech. Coll., Aberdeen, 1st class cert., 1902-08, ap'ticeship as civil engr., Great North of Scotland Rly., Aberdeen, 1902-07, and from 1907-11, asst. engr. in charge of extension and improvements of rly.; 1911-14, res. engr., 3 Sections, Pembroke North Bay. Ont., C.N.R; 1914-19, Major, Royal Engin., repair, constrn. & mtce. of mil. rlys. in France and Belgium. Awarded M.C.; 1919 to date, Garrison Engr., Military Works Service, India, in charge of constrn. etc., of military cantonments, fortifications, bldgs., streets, water supply etc.

— BY —

THE ENGINEERING INSTITUTE OF CANADA

INCORPORATED IN 1887 AS

THE CANADIAN SOCIETY OF CIVIL ENGINEERS

ENTERED AT THE POST OFFICE, MONTREAL, AS SECOND CLASS MATTER

VOLUME V | MONTREAL, FEBRUARY 1922 | NUMBER 2

Report of Council for the Year 1921.

Of the varied phases of *The Institute's* activities to distinguish the year 1921, the establishment of three new Branches, one at Sydney, Nova Scotia, known as the Cape Breton Branch, one at London, Ontario, and the other at Lethbridge, Alberta; a very substantial increase in membership and an expansion of Branch activities are the more notable.

It is undeniable that the year just closed has been one of the poorest from the view-point of engineering operations for many years, resulting in considerable individual hardship on account of unemployment, which condition Headquarters has sought in every way to alleviate, but, on account of economic conditions, with indifferent success. It is some satisfaction to note that the outlook for the coming year is more promising.

This year has seen the greatest engineering gathering yet held in Canada, when, under the auspices of the Toronto Branch, the Annual Professional Meeting was held in that city in February, the success of which was largely attributed to the organizing ability of the Toronto Branch Officers, and was an indication of the fact that engineers are becoming more and more alive to the advantages of meeting for social and professional intercourse. The Professional Meeting at Saskatoon, while fewer in numbers, was marked by continuous enthusiasm, and by a series of papers that would be a credit to any engineering gathering. A Council meeting was also held during this meeting. Authorization was given for a Council meeting to be held in Ontario during the current year, at a date to be set by the Ontario Provincial Division.

The difficulties involved in connection with the work of the Committee on Policy, due to its breadth of scope and the many factors presented to it for consideration, became apparent during the year, and although the Committee has done a great deal of work it has been found impossible to put the result into final shape without a meeting of the Committee, and it is therefore recommended to the incoming Council that a meeting be held shortly of the Committee.

Classification and Remuneration have been advanced to a point where the Committee's final report is under consideration by Council at the present time, and it is anticipated that this report will be submitted to the various Branches in the immediate future, for discussion and suggestions.

The report of the special committee on Publications, dealing with the question of rules and regulations regarding the publication of papers presented at Branches and

Professional Meetings, has been approved by Council, and will be found printed under Institute Committee reports.

Various Institute Committees in addition to those already mentioned, have done notable work during the past year. Of outstanding importance is that of the Committee on the Deterioration of Concrete in Alkali Soils, which is endeavouring to solve the problem which confronts the Prairie Provinces. The sum of thirteen thousand dollars has been raised to follow up more effectively the work done by this Committee during the past two years. The thanks of *The Institute* are due the Honorary Advisory Council for Scientific and Industrial Research, the Canadian Pacific Railway, the Canada Cement Company, the Province of Alberta, the Province of Saskatchewan, and the City of Winnipeg. It is hoped that this Committee's results will be of lasting benefit to the profession.

The happy relations existing between *The Institute* and the four founder engineering Societies of the United States, is illustrated by the fact that arrangements have been made with the American Society of Mechanical Engineers, the American Institute of Mining and Metallurgical Engineers, the American Society of Civil Engineers, and the American Institute of Electrical Engineers, whereby members of this *Institute* receive all the Transactions and publications of the founder Societies at the same price as that paid by their own members. In the case of the American Institute of Electrical Engineers, this amounts to the same price as paid by the members for transactions, in addition to their dues. With the other Societies it is amount paid by members for additional copies, and is equivalent in most cases to a fifty percent discount on the advertised rates. *The Institute* extends a similar courtesy to the sister societies, and it is hoped that the arrangement will be mutually beneficial.

The strength of *The Institute*, and its growth in the professional field, is well reflected in the operations of *The Institute* as a whole during the past year. Every Branch has shown a satisfactory growth, resulting in about fifteen percent increase in membership. For the first time a budget system was adopted by the Finance Committee, and the financial statement is one which reflects a flourishing organization, while the very large number of papers presented at professional and branch meetings, as shown in the reports, is an indication of the general activity of *The Institute.*

While lamenting the loss by death of a number of prominent members of *The Institute*, it is with particular regret that Council records the death of Sir John Kennedy, K.B., Hon. M.E.I.C., a charter member of *The Institute*, Past-President, one of its first Vice-Presidents, and for eleven years a Councillor, in honour of whose position in the engineering world, it is proposed to place a bronze tablet in *The Institute* Headquarters.

Meetings

Professional meetings were held as follows:—

Annual General Professional Meeting held in Toronto, Ont., February 1st., 2nd., and 3rd, 1921, at which the following papers were read:—

"Design of Sewage Disposal Scheme for a City located on Tidal Waters", by C. J. Yorath, A.M.E.I.C.

"Cost-Plus Contracts", by J. Clark Keith, A.M.E.I.C.

"Hydrated Lime a Chemical Engineering Product", by Lucius E. Allan, M.E.I.C.

"Toronto Filtration Plant", by James Milne, M.E.I.C.

"Heating and Ventilation of Paper Machine Rooms", by Edward A .Ryan, A.M.E.I.C.

Practice of Ventilation of Paper Machine Rooms", by E. A. Briner.

"Mechanical and Electrical Equipment of the Toronto Union Station", by Walter J. Armstrong, A.M.E.I.C.

"The Canadian Pulp and Paper Industry", by T. Linsey Crossley, A.M.E.I.C.

"Chemical Engineering in the Packing House", by J. Richardson Donald.

"Present Day Illumination Standards", by George C. Cousins.

"Municipal Engineering", by R. O. Wynne-Roberts, M.E.I.C.

"The Activated Sludge Process of Sewage Disposal", by George G. Nasmith.

"Some Controversial Points in Concrete Specifications", by Frank Barber, A.M.E.I.C.

"On the Economics of Building Construction", by J. Morrow Oxley, A.M.E.I.C.

"Toronto Harbour Improvements", by Edward L. Cousins, A.M.E.I.C.

"Control of Corrosion in Iron and Steel Pipes" by F. N. Speller.

Tenth General Professional Meeting held at Saskatoon, Sask., August 10th, 11th, and 12th, 1921, at which the following papers were read:—

"The Development of Trunk Highways as Affecting the "Western Provinces", by C. W. Dill, M.E.I.C.

"Water Supply and Irrigation Schemes of the Prairie Provinces", by G. N. Houston, M.E.I.C.

"The Audion and its Applications", by R. S. Parker, A.M.E.I.C., and S. B. Sherman, A.M.E.I.C.

"The Self-Corrosion of Cast Iron and other Metals in Alkaline Soils", by W. Nelson Smith, M.E.I.C., and Dr. J. W. Shipley.

"What about Western Coal", by R. de L. French, M.E.I.C.

"The Coal Situation of Western Canada", by William Pearce, M.E.I.C.

"Economics and Engineering Features of the Manitoba Power Commission", by J. Rochetti, M.E.I.C.

"The Water Powers of the Prairie Provinces", by C. H. Attwood, A.M.E.I.C.

"Northern Territory in Western Canada, Its Development and Problems", by R. C. Wallace.

"The Disintegration of Concrete in Alkali Soils", by G. M. Williams, A.M.E.I.C.

Roll of the Institute

Elections during the year resulted in the following additions to the roll:—one Honorary Member, seventy-one Members; three hundred and thirty Associate Members; one hundred and fifteen Juniors; three hundred and forty-seven Students and ten Associates.

The following transfers were made:—thirty-eight Associate Members to the class of Member; one Associate to the class of Member; thirty-seven Juniors to the class of Associate Member; twenty-five Students to the class of Associate Member; twenty-one Students to the class of Junior.

The following is a detailed statement of elections and transfers which have taken place. These are included in the official membership roll as acceptances are received and have been published monthly in *The Journal* immediately after election:—

Elections.

Removals from Roll

There have been removed from the Roll by resignation or on account of non-payment of dues:—sixteen Members; fifty Associate Members; seventy-one Juniors; one hundred and six Students and ten Associates. A detailed list of resignations accepted is as follows:—

Members.............Barton, Donald S.
Crenshaw, Smith S.
deLotbinière, A. C. Joly.
Fergie, Charles.
Frost, Harwood
Leach, Lt.-Col. Francis E.
Macintyre, Robt. Wentworth
Tarr, Charles Winthrop
Weatherbe, Lt.-Col. Paul
Webster, Henry
Wilkin, Lt.-Col. Francis A.

Associate Members....Ayer, Kenneth Roger
Bagshawe, Frederick T.
Charton, Capt. Pierre
Cowin, James
Dion, Alfred Hector,
Eriksen, Borge O.
Finlay, Delmar C.
Freeland, Philip Broke
Godwin, Benjamin
Harris, A .Dale
Hodge, Charles A.
MacNeil, Hector
Mullarkey, John P.
Smith, Geo. W.
Whitney, Arthur W.

Junior.................Stanley, Major H. P.

Students..............Emmons, E. F.
Gervan, C. F.
Godin, Charles
Haliburton, E. D.
Hayward, John Gray
Hovey, John A.
Jamieson, Eldred
MacDonald, J. P.
McLean, John Reginald
McLellan, N. W.
Pfeiffer, Walter M.
Payment, Euclide
Sirett, E. James
Tanton, John F.
Warner, Donald Franklin
Wright, E. S.

Associates............Bate, Wm. C.
Cowan, John Robert
Morrison, Thomas A.

Deceased Members

The following deaths, thirty-two in number, have been reported, of which number, eight were killed in action or died as the result of wounds and illness contracted during war service.

Members.............Bayne, Geo. Arthur
Burley, Ralph J.
Busteed, F. F.
Fawcett, Thomas
Hill, Albert James
Kennedy, James Cron
Kennedy, Sir John, LL.D. (Hon. Member)
Langton, John
McKay, Owen
Robb, Aubrey Granger
Sing, J. G.

	Tomlinson, A. T.
Associate Members....	Chataway, Chas. T.
	Drummond, T.
	Girard, Joseph E.
	Keefer, E. C.
	Mason, Major John
	McLellan, John Wm.
	McPhee, Capt. Murdoch N.
	Phillips, Archibald M.
	Powell, Major Alan Torrance
	Ruhl, Harry Thornton
	Stuart, William James
	Thorne, Major Stuart M.
	Waldron, Major Stanley M.
Juniors................	Allan, Lieut. H. D.
	Davis, Wm. James
	Duff, Miles O'Reilly
	Williams, Jack Northmore
Students.............	Jacquemart, Rene
	Probst, Emile
Associate.............	Kammerer, Jacob A.

Killed in action or died as the result of wounds, and illness contracted during war service:—

Associate Members....	Mason, Major John
	Powell, Major Alan Torrance
	Stuart, Lieut. William James
	Thorne, Major Stuart M.
	Waldron, Major Stanley M.
Junior................	Allan, Lieut. H. D.
Students.............	Jacquenart, Rene
	Probst, Emile

Total Membership

At present the membership stands as follows:—

Honorary Members............	10
Members.....................	1018
Associate Members............	2285
Juniors.......................	438
Students.....................	899
Associates....................	38
	4688
Elected — acceptances pending.	191
	4879

Respectfully submitted,

J. M. R. FAIRBAIRN,
President.

FRASER S. KEITH,
Secretary.

Library and House Committee

The President and Council,

On behalf of the Library and House Committee I beg to submit the following report. Your Committee had hoped to have a complete catalogue of the Library printed during the present year, but owing to other expenditures made by your Committee it was considered necessary to hold issuance of the catalogue until a later period. The present Library is catalogued according to a modification of the Dewey decimal system, published by the American Society of Civil Engineers a few years ago. Since its adoption by *The Institute* the United Engineering Societies Libraries, comprising the joint libraries of all the founder engineering societies of the United States, has adpoted the Dewey decimal system in its original form, and your Committee recommends that this system be adopted in *The Institute's* Library.

Additional equipment for the Assembly Hall was provided by the addition of fifty chairs, and in view of further accommodation being necessary, your Committee is now investigating the cost of providing additional by the means of a gallery. Should the cost of this prove too great it is recommended that an additional fifty chairs be purchased.

The question of improving the ventilation has received considerable thought, and a report is now in progress to Council, outlining this subject, together with that of increased accommodation.

It is felt by your Committee that the Library would be strengthened by the purchase of a number of modern engineering text-books, provision for which might be made in the budget for the coming year, if the suggestion meet with your approval.

Publication Received

The following publications were presented to *The Institute* during the year.—

By Octave Doin, publisher, Paris.

"La Technique des Pétroles" by R. Courau.

By the Institute of Naval Architects.

"Transactions of the Institution of Naval Architects

By Masson et Cie., publishers, Paris.

"Traité de Chimie Physique", translation by Wm. C. Lewis.

By D. Van Nostrand Company, New York, publishers.

"Cam. Design and Manufacture" by F. B. Jacobs.

By Canadian Engineering Standards Association.

"Standard Requirements for Single-Phase Distribution".

By National Board of Fire Underwriters, Bureau of Standards and Associated Factory Mutual Fire Insurance Companies.

"Fire Tests of Building Columns."

By American Concrete Institute.

Proceedings, Vols. 1 to 8; 12 to 16.

By A. C. Tagge, M.E.I.C.

Proceedings of the Royal Society of Canada, 1883 to 1892 inclusive.

By R. W. Leonard, M.E.I.C.

Book of Plans of New York State Barge Canal.

By Roy Campbell, A.M.E.I.C.

ALEX. BERTRAM,
Chairman.

Papers Committee

The President and Council,

On behalf of the Papers Committee I beg to submit the following report for the year 1921.

The Papers Committee is composed of the Chairman of the various Branches of the Institute with myself as Chairman of the whole Committee. On account of the members of the Committee residing so far apart, no attempts have been made to hold any meetings, but the Committee, nevertheless, has provided a means of interchange of papers between the Branches.

The activities of the Branches have been carried out so successfully that there has not been any great demand on the Papers Committee of the Institute for assistance but a number of meritorious papers have been sent in and I have referred them to other Branches for their use.

Respectfully submitted,

FREDERICK B. BROWN,
Chairman.

Committee on Legislation and By-Laws

The President and Council,

On behalf of the Committee on Legislation and By-Laws, I have the honour to report that peace and harmony has prevailed throughout the whole year as far as this Committee is concerned, and that nothing beyond the formal approval of Branch By-Laws has been submitted to the Committee.

Your Committee has kept in close touch with the legislation situation throughout the whole Dominion, and confidently believes that the period of evolution through which the profession is now passing will end in the haven of recognition already attained by our sister professions — law and medicine. This end cannot be reached by us, however, until its need is fully recognized by our members, and by everyone engaged in any branch of the profession, as well as by our legislators, and it is more than ever incumbent upon us, each and every one, to act in such a way that the public will appreciate our high ideals and in the end realize the wonderful part the engineer is playing in our great civilization.

Respectfully submitted,

WALTER J. FRANCIS,
Chairman.

Finance Committee

The President and Council,

On behalf of the Finance Committee, I have the honour to submit herewith the Financial Statement for the year 1921.

In presenting this statement, I would venture to call your attention to the fact that this is the first year during which the financial affairs of *The Institute* have been upon a budget system. The estimated operating surplus appearing in the budget prepared at the beginning of 1921 was $10,468. The actual operating surplus as certified by your Auditors is $10,313.73 exclusive of the hereinafter mentioned recommendation regarding the disposal of entrance fees. This is a satisfactory result in view of the difficulty of estimating either the revenue or expenditure on the items of *Journal* and transactions.

The Committee begs to recommend that as much as possible of the 1921 entrance fees be reserved to discharge our mortgage obligations, and for the future the whole of this amount be set aside for said purpose until such time as the mortgage is wiped out.

The Committee further recommends that the budget system be continued, and that for the future three annual statements be prepared for the Council:—

(a) Balance Sheet.
(b) Statement of Cash Receipts and Disbursements.
(c) A statement showing the operating condition of *The Institute.* This statement should include not only the cash but Bills Receivable and Bills Payable in order that the members may observe quickly the actual financial status of *The Institute.* This statement would correspond to the one that has been submitted to the Council from year to year.

Respectfully submitted,

R. A. ROSS, *Chairman.*

The President and Council,

Dear Sirs:—

We have completed the Audit of the Books ane Accounts of *The Engineering Institute of Canada* for thd year ending 31st December 1921, and submit herewith Statements of Assets and Liabilities as at that date and Revenue and Expenditure for the past year duly certified by us.

All expenditure has been properly supported by vouchers. The cash on hand and in Bank has been verified and the Investments held have been verified by personal inspection.

We append hereto a Schedule showing the position of the various Special Funds.

We certify that we have obtained all the information and explanations we have required, and that, in our opinion, the accompanying Balance sheet is properly drawn up so as to exhibit a true and correct view of the state of the affairs of *The Institute* as at 31st December 1921.

Faithfully yours,

RIDDELL, STEAD, GRAHAM and HUTCHISON, C.A.
Auditors.

STATEMENT OF ASSETS AND LIABILITIES AS AT 31st, DECEMBER 1921

Assets.

Canadian Engineering Standards Committee

The President and Council,

On behalf of the Canadian Engineering Standards Committee, I beg to submit the following report:—

Personnel

The Institute is honoured with having three members on the Main Committee of the Canadian Engineering Standards Association. At the beginning of this year the personnel of this Committee was as follows:—W. F. Tye, M.E.I.C., for one year; H. H. Vaughan, M.E.I.C., for two years; and the writer, for three years.

During the past year the work of the Association has developed considerably. The various working committees now complying upwards of 250 members, and the number is constantly increasing as work is commenced on new subjects. In the prosecution of this work *The Engineering Institute* is vitally interested, and over half the number of the Committee members are members of *The Institute.*

Publications

The publications during the year are as follows:—

No. 3, 1921, Standard Specifications for Galvanized Telegraph and Telephone Wire.

No. 4, 1921, Standard Specifications for Wire Rope for Mining and Dredging Purposes.

The Specification for Portland Cement is in the press.

The following publications are in an advanced stage of progress, and will shortly be ready for submission to the Main Committee for authority to print:—

Reprint of Standard Specification for Steel Railway Bridges.

Standard Specification for Steel Highway Bridges.

Standard Requirements for A.C. Watt-hour Meters.

Outside Relations

The establishment of cordial relations with the various European national standardizing bodies has been an important feature of the year's work. An arrangement has been approved by the Main Committee and is now in effect whereby information as to the progress of the work of the various Canadian Engineering Standards Association Committees is periodically transmitted to the organizations doing similar work in other parts of the world. Similar information as to their own work being furnished by these bodies in return. In this way overlapping and duplication of work will be avoided, and data as to work already accomplished elsewhere in any subject can be readily applied for.

Specially close co-operation and consultation has taken place with the British Engineering Standards Association, and with the American Engineering Standards Committee in several instances, (gearing for example), members of our Committee have been invited to attend meetings of the American Engineering Standards Committee with very satisfactory results.

The sympathy and financial assistance of *The Engineering Institute of Canada* has been greatly appreciated by the Main Committee of the Canadian Engineering Standards Association; in many subjects, (as for instance, the important one of Concrete and Reinforced Concrete), it is felt that the two organizations must work hand in hand if the best results are to be obtained by either.

New Activities

During the last few weeks a number of important suggestions for activity have been received, among which may be mentioned one from the Automobile Club of Canada requesting the formation of a Committee to draw up, if possible, specifications for gasoline, which will be acceptable to, and used by the manufacturers, and one from the Dominion Highways Commission, asking for the organization of a Sectional Committee on Road Materials and Construction, with the view of obtaining the co-operation of the various Provincial Highways Authorities, engineers and contractors, in defining and specifying road materials and methods so as to avoid confusion and secure uniformity wherever possible in the requirements for this important work throughout the Dominion. *The Institute,* of course, is primarily interested in this work.

Progress

In some cases, progress by the working committees has been disappointingly slow, not from lack of willingness on the part of the chairmen and members, but because of the time necessary to ensure that all interests concerned actually receive thorough consideration of their proposals, and that these proposals are adequately criticized before adoption.

Our late Chairman

This year the Committee sustained a great loss in the death of its founder and President, Sir John Kennedy, Hon.M.E.I.C. Untiring in his interest and co-operation, his keen judgment and long experience were of very great value, and while we mourn his loss, we are thankful that such long years of service to the engineering profession and to mankind were his portion.

Secretarial Work

Your representatives cannot close this report without referring in the most complimentary terms to the highly efficient and indefatigable work of the General Secretary, R. J. Durley, M.E.I.C. The success so far attained by the Committee is, in no small measure, due to his unflagging interest.

Respectfully submitted,

WALTER J. FRANCIS,

Chairman.

Canadian National Committee International, Electro-Technical Commission

The President and Council,

On behalf of the Canadian National Committee of the International Electro-technical Commission, I beg to submit the following report for the year 1921.

The main activities of the Committee have been connected with the completion of the system of International Electrical Symbols, and also with the question of the adoption of names for the fundamental Electro-Magnetic Units. The latter subject was brought to the fore by the action of the Danish Committee in appealing, in connection with the centenary of the discovery of Electro Magnetism by Oersted, for this name to be given to one of the Electro-Magnetic Units.

This appeal brought expressions of views from most of the National Committee, and the matter is still under consideration.

The Committee hope to be represented in Paris at the International Conference on technical problems connected with high tension distribution by Major Edgcumbe.

Yours truly,

L. A. HERDT,
Chairman.

Civil Service Classification Committee

The President and Council,

The Civil Service Classification Committee has not been called upon for any action during the past year and consequently has had no meeting.

Respectfully submitted,

J. M. R. FAIRBAIRN,
Chairman.

Committee on Deterioration of Concrete in Alkali Soils.

The President and Council,

On behalf of the Committee on Deterioration of Concrete in Alkali Soils, I beg to submit the following report. An organization meeting of the Committee as originally constituted was held at the University of Saskatchewan, Saskatoon, Sask., April 23rd, 1921. A general discussion of the problem by the Committee members, all of whom have been familiar with the effect of alkali on concrete for several years, indicated that there was complete agreement as to the course which should be pursued in the investigation. Since previous investigations have established the fact that the best of Portland cement concrete may not prove permanent under certain known exposure conditions it was agreed that the main effort should be directed towards the chemical problems involved, including the constitution of cement and the chemical reactions between the soluble salts and the constituents of the cement. There is at present little to be gained by an extensive series of exposure tests of concrete to field conditions and it was decided to limit this phase of the investigation to a limited number of concrete specimens which would later serve as a basis of comparison with future field work which might be planned as a result of the findings of the chemical laboratory. It was further agreed that a physical chemist having the highest qualifications be obtained to direct and supervise the chemical research and steps were taken to survey the field of available men in that line of work. In order that the Committee might have the benefit of the advice and experience of a number of chemists of the Prairie Provinces who are familiar with the alkali-concrete problem, the appointment by the Council of *The Institute* of the following to full membership on the Committee was recommended:—

- Dr. J. W. Shipley, professor of chemistry, University of Manitoba.
- Dr. T. Thorvaldson, professor of chemistry, University of Saskatchewan.
- F. C. Field, city analyst, Calgary.
- A. G. Blackie, city analyst, Winnipeg.
- J. A. Kelso, provincial analyst, Edmonton.

The above were later designated as Committee members and have since taken an active part in the work of the Committee.

A second series of meetings of the Committee was held in Saskatoon, August the 10th to 12th, 1921, at the time of the Tenth General Professional Meeting. After thorough consideration of the names of available chemists, it was decided to ask Dr. Thorvaldson, a Committee member, to take charge of this chemical research, which he accepted subject to the approval of Dr. Murray, president of the University of Saskatchewan. Dr. Thorvaldson has been directing the work of several assistants during the past year in connection with certain phases of the alkali-concrete problem and it was felt that he would be in a position to take active charge with a minimum of delay. The University of Saskatchewan has since agreed to this arrangement and in addition to offering all of its available facilities to advance the progress of the investigation has freed Dr. Thorvaldson from all class work so that beginning with January, 1922 he will devote all of his time to the research.

A report of the contributors to the funds of the Committee was made as follows:—

Council for Scientific and Industrial Research.	$5000.00
Province of Saskatchewan	3000.00
City of Winnipeg	200.00
Province of Alberta	1000.00
Canada Cement Company, Ltd.	3000.00
Canadian Pacific Railway	1000.00
Total	$13,200.00

A detailed report of the present status of the Chemical research appears later.

Report of Field Tests — Summer of 1921.

Following out the intention of the Committee that a limited amount of field investigation be started during the summer of 1921, concrete block specimens for exposure tests were moulded in the Concrete Laboratory of the University of Saskatchewan for exposure to alkali soil waters at points in Alberta, Saskatchewan and Manitoba.

These specimen are cylindrical in shape, 7″ in diameter and 21″ long, moulded in sheet metal forms. Two qualities of concretes were employed, having strengths of approximately 1200 and 2500 pounds per square inch at 28 days. Canada and Super brands of Portland cement were used. Three different aggregates were used for each of the above cements and qualities of concrete, gravel used in commercial work in the vicinity of Winnipeg, Saskatoon and Strathmore, Alta. After preliminary tests of the cements and aggregates, batches of concrete were carefully proportioned and mixed by hand and test specimens were cured in moist air for 27 days after 24 hours of hardening in the forms. From each batch of concrete prepared, there were moulded not less than six large exposure cylinders, 3-6″ x 12″ compression test cylinders and two slabs for permeability tests of the concrete. All obtainable data such as characteristics of cement and aggregate and weights of each used were noted for further study.

In addition to plain concretes listed above, other batches were prepared using various waterproofing and alkali proofing compounds suggested by the Committee members and different manufacturers as well as "Commercial" cement, a natural cement manufactured near Winnipeg. Some waterproofings are of the integral type while others are liquids or bituminous coatings applied to the surface after curing is completed. Each batch of concrete moulded was given a series number. In all 28 series or batches were prepared. Before shipment all specimens were wrapped in heavy paper and crated separately for protection.

Shipments of 56 test cylinders, (28 series) were made to the following points early in September for exposure to Alkali conditions.

Cassils, Alta.:—One group was placed in a heavy alkalied tract of land near Cassils, Alta., in a locality which has been used for several years by the Department of Natural Resources, C.P.Railway for similar experiments.

Grandora, Sask.:—One group was placed along the shore line of a sulphate lake near Grandora, Sask., about 14 miles west of Saskatoon.

Winnipeg, Man.:—A group was placed along the Aqueduct of the Greater Winnipeg Water District at a spot where analyses showed the ground water concentration to be highest.

At Cassils, Alta., the ground water table is only slightly below the ground surface and the blocks were embedded with about 6″ projecting. At Grandora, Sask., the same scheme was employed. At Winnipeg the water table was found about 8 feet below the surface which necessitated the excavation of the soil to a depth of 8 feet in an area about 50 feet square.

A systematic method of securing samples of the alkali waters, during the period that the ground remains unfrozen has been adopted and the inspection of the condition of the individual blocks will be made at least twice yearly, in the spring and in the fall.

The Portland Cement Association is at present conducting extensive field experiments in the United States and is cooperating with the work of our Committee by furnishing groups of 82 blocks each for exposure at the above three points. These have been installed alongside our own blocks and will be given the same inspection. The Super Cement (America) Limited has also furnished a number of small test pieces made in their laboratory which have been placed with the large blocks.

Report on Chemical Research.

Since September three graduate students holding bursaries from the Honorary Advisory Council for Scientific and Industrial Research have been working on certain phases of the problem. The laboratory work so far done is of a preliminary nature concerned mainly with the action of the various salts under consideration on some of the simpler substances in cement and concrete. A considerable quantity of equipment specially adapted to this investigation has been ordered and is now being delivered. In September Dr. Thorvaldson made a trip to Washington, D.C., and conferred with the members of the Cement Division of the Bureau of Standards and the research workers in the Geographical Laboratory of the Carnegie Institution on questions relating to this investigation. The bulk of the advances so far made in America as to the constitution of cement has been accomplished at these two laboratories and it was therefore considered important to ascertain what work on this subject they proposed to continue and correlate our work with theirs. We look forward to a cordial cooperation with these institutions. To date difficulty has been encountered in obtaining a trained assistant for the petrographical work. This phase should be carried on along with physical, chemical and collodial examinations of the disintegration of concrete. In addition to the foregoing and the graduate students whose services will continue, additional assistance will be required and is now being arranged for, and the force of trained research workers will be increased as rapidly as the different phases of the investigation unfold during the next few months. As stated above Dr. Thorvaldson is now devoting his full time to conducting and carrying on the chemical investigation.

Respectfully submitted,

G. M. Williams,
Secretary.

Honour Roll and War Trophies Committee

The President and Council,

On behalf of the Honour Roll and War Trophies Committee I beg to submit the following report. During the past year your Committee has secured the nucleus of an exhibit of war trophies, which have been placed in a glass case at *The Institute* Headquarters. It is suggested by the Committee that members of *The Institute* who have trophies which they do not desire to keep, might donate them to *The Institute*, where they could be placed on permanent exhibition, and for which credit will be given the donor.

Through the efforts of your Committee, and after considerable negotiations, we were able to secure for *The Institute* a captured German field gun, which has been mounted on a concrete base alongside the Headquarters building, and which will stand as a lasting

monument of the part played by Canadian engineers in the late War. It is hoped that a suitable bronze tablet may be placed on this trophy to commemorate the gallant part taken by the many members of *The Institute* in every branch of overseas service.

Respectfully submitted,

CHARLES J. ARMSTRONG,
Chairman.

Committee on International Co-operation

The President and Council,

On behalf of the Committee on International Co-operation, I beg to submit the following report.

Your Committee reports a continuation of friendly fraternal relations between *The Institute* and the founder engineering societies of the United States. Following the policy previously adopted, members of *The Institute* have been encouraged to attend the annual conventions of the founder societies in which they are members. One member of this Committee, John Murphy, M.E.I.C., attended as an official delegate of *The Institute*, a Peace Dinner, given in New York on October 10th, in honour of distinguished British and European engineers.

The outstanding announcement of your Committee is to advise that successful negotiations have been completed with the American Society of Civil Engineers, and the American Institute of Electrical Engineers, whereby our members shall receive the publications of these Societies at the same price as their own members, following a similar arrangement made last year with the American Society of Mechanical Engineers, and the American Institute of Mining and Metallurgical Engineers, in return for the same courtesy extended by *The Institute.*

Respectfully submitted,

H. H. VAUGHAN,
Chairman.

Publicity Committee

The President and Council,

Enclosed herewith is a copy of a report prepared in June 1921 by your Committee on Publicity, consisting of Professor Peter Gillespie, M.E.I.C., of Toronto; J. B. Challies, M.E.I.C., of Ottawa; H. H. Vaughan, M.E.I.C., of Montreal, and the writer as Chairman. Since preparing this report, further discussions have taken place and correspondence passed amongst the members of the Committee, and with certain representatives of the technical press, in an endeavour to harmonize the very conflicting opinions expressed.

The members of your Committee are not unanimous in the opinion that the suggested regulations are the best that can be drafted, but the majority of the Committee feels that the suggested regulations will serve the present purpose well, at least until they will have been in force for some time to see how they work out in practice. With the amendment to the by-laws worded as it is in our report, it will be possible for Council to change the regulations as it sees fit from time to time to meet any requirements that may arise.

It is suggested by one member of our Committee that it might be well not to make the proposed regulations a definite ruling of Council until, first, they have been submitted to the various Branches for immediate consideration and advice, and second, they have been made the basis of a consultation between the Institute Committee and a Committee representing the Trade and Engineering Journals of Canada.

After two years' experience in this Committee work, the writer feels thoroughly convinced that no restrictive regulations which any committee could put out will be acceptable to the technical press, which apparently desires an absolutely free hand to gather news wherever and in whatever manner it can do so.

Your Committee feels that it has completed the work it was asked to do, and begs to be relieved of its duties.

Respectfully submitted,

FREDERICK B. BROWN,
Chairman.

The President and Council,

Your Special Committee on Publicity in connection with Institute Papers and Addresses have continued the work they have been doing during the past year and now beg to present their report covering the work done to date. A great deal of correspondence has been exchanged between the members of the Committee, and representatives of the technical press have been interviewed. We have come to the conclusion that it will be impossible entirely to satisfy the representatives of the technical press by imposing any restriction whatever on the publication of Institute Papers. We realize that a certain amount of publicity in the technical press is desirable, especially if proper acknowledgement of the author's standing as a member of *The Institute* be made with the publication of the paper, but on the other hand we feel that some restrictions are necessary in the interests of *The Institute* and the author himself.

A solution which appears to meet the case well is to amend the by-laws as follows, — delete clause 3 of section 22 and substitute for this clause the following, which would become a new clause 3 of section 21 of the by-laws.

"All papers, written discussions thereon, or communications accepted for presentation at any Branch, Provincial Division, General Professional, Annual or other meeting of *The Institute*, as "Institute Papers" shall be considered the property of *The Institute.* The publication of such papers shall conform to regulations issued from time to time by the Publication Committee

and shall be subject to their decision. Any paper which has not been accepted shall be promptly returned to its author."

You will note in the above proposed amendment that the proposed restrictions apply only to papers accepted as "Institute Papers." This gives considerable leeway in deciding whether a paper is of sufficient importance to hold for the Transactions or *The Journal*, and it would also save dignifying as an Institute Paper a mere address of no real importance or a subject of purely local interest. We would therefore suggest that the above amendment be issued temporarily as a ruling of Council, and an amendment in the by-laws made accordingly. This would place the matter on a proper footing and the following suggested regulations could apply and be changed from time to time as found necessary or desirable without any further change in the by-laws.

Your Committee suggests the following regulations:—

1.—No Institute paper shall be published without written consent of the Publication Committee of *The Institute* in advance of its presentation before *The Institute* except it be in a regular or special edition of *The Journal*. All papers published in *The Journal* in advance of being read at a meeting of *The Institute*, shall, after being read, be immediately available for publication elsewhere.

2.—Any Institute paper published in advance of presentation or in advance of its publication in *The Journal* unless with the written consent of the Publication Committee of *The Institute*, shall be ineligible for inclusion in the Transactions of *The Institute* or for competition for any of *The Institute* prizes or medals.

3.—Institute papers of general or purely local interest may, with the author's permission, be published anywhere immediately after being read.

4.—Institute papers descriptive of engineering work of a technical nature or of a general engineering or technical nature may be published other than in *The Institute*'s publications in abstract only, unless by special arrangement with the Publication Committee, such abstract to be made by the author or by a committee.

5.—All Institute papers shall be subject to editing and revision by the Institute Committee before publication in the Transactions. A paper so revised shall not be published in the Transactions without the consent of the author to the proposed changes.

6.—When necessary to publish a paper in abstract in *The Journal*, the author should be requested to furnish an abstract corresponding with the space available or to consent to the paper being abstracted by the Publication Committee.

7.—The author of any paper should be requested to submit with his paper a list of members of *The Institute* specially qualified to discuss his paper and the Secretary should call the paper particularly to the attention of these members and others locally known to him as likely to be interested in it, urging them to be present at the meeting at which the paper is to be presented and to join in its oral discussion.

8.—The printing of his own discussion should be optional with the speaker.

Respectfully submitted,

FREDERICK B. BROWN,
Chairman.

Roads and Pavements Committee

The President and Council,

I beg to submit the following report with respect to the work of the Roads and Pavements Committee for the Calendar year 1921.

The year 1921 has been a season of somewhat exceptional activity with respect to road construction and paving throughout Canada; so that the Chairman of this Committee experienced some slight difficulty in securing the prompt attention of members of the Committee whose services would be most valuable. It is anticipated, however, that with the foundation laid during the past year, very satisfactory results will accrue during the year 1922 with respect to the work carried on by this Committee.

The Committee has undertaken the task of preparing general specifications for various types of roads and pavements and has allocated the drafting of these specifications to various individual members as follows:—

A. F. Macallum, M.E.I.C.	—Block Pavements.
W. P. Brereton, M.E.I.C.	—Sheet Asphalt.
J. A. Duchastel, M.E.I.C.	—Macadam.
W. P. Near, M.E.I.C.	—Cement Concrete.
L. C. Charlesworth, M.E.I.C.	—Gravel.
W. A. McLean, M.E.I.C.	—Bituminous Penetration and Bituminous Concrete.

It is intended that the several specifications will be prepared with some degree of uniformity, based on the following outlines:—

1. *General Description.*
2. *Preparation of Subgrade.*
   - (a) Cleaning
   - (b) Shaping to grade
   - (c) Consolidating.
3. *Foundation.*
   - (a) Brief Description
   - (b) Dimensions
   - (c) Materials
   - (d) Method
   - (e) Cleaning.
4. *Binder Course (Cushion).*
   - (a) Brief Description
   - (b) Dimensions
   - (c) Materials
   - (d) Method.

5. *Top Course.*
   - (a) Brief Description
   - (b) Materials
   - (c) Method of Handling
   - (d) Finishing
   - (e) Joints.

6. *Seal Coat (Grouting).*
   - (a) Brief Description
   - (b) Materials
   - (c) Method of Handling.

7. *Shoulders.*
   - (a) Brief Description
   - (b) Materials
   - (c) Method of Handling.

Committee On Uniform Steam Boiler Specifications

On behalf of the Committee I beg to report as follows on the progress made during the past year in having uniform boiler regulations adopted by the different provinces.

The regulations which the Committee recommend for adoption have been printed in pamphlet form and sample copies may be obtained from R. N. Blackburn, chief inspector of steam boilers, Regina, Sask.

These regulations have now been officially adopted by the different Provinces of Saskatchewan, Manitoba and Alberta.

The chief inspector of boilers for Ontario advises that sample copies of these regulations are being prepared for the consideration of the Minister of Labour for Ontario. It is expected that Ontario and British Columbia will adopt them at an early date.

The Department of Public Works of the Province of Nova Scotia has been supplied with copies of these regulations and is considering the advisability of adopting them.

Your committee hopes to bring the advantages of adopting these rules before the proper authorities in the remaining Provinces of Quebec, New Brunswick and Prince Edward Island, in the near future, in order that Canada shall have uniform boiler regulations in all the Provinces.

The membership of the Committee is as follows:— L. M. Arkley, M.E.I.C., Chairman, W. G. Chace, M.E.I.C., F. G. Clark, M.E.I.C., R. J. Durley, M.E.I.C., D. W. Robb, M.E.I.C., H. H. Vaughan, M.E.I.C.

Respectfully submitted,

L. M. Arkley,
Chairman.

Branch Reports

Victoria Branch

The President and Council,

On behalf of the Executive Committee I beg to submit the following report. I have pleasure in presenting for your consideration, some particulars of the work of the Branch during the past twelve months, which I trust be satisfactory, and meet with your approval.

Membership

Since the last annual meeting there have been a few changes in the membership of the Branch, which the following statement will make clear:—

Active members on present list

Members	25
Associate Members	41
Juniors	2
Students	3
Total	71

Changes

	Members	Assoc.Mem.	Gain	Loss
Died	–	1	-	1
Resigned	2	–	–	2
Left City	2	1	–	3
New Residents	4	3	7	–
Elected	–	2 1 Jr.	3	–
			10	6

Net gain of four.

Transfers

Only one transfer has been effected during the year, from Student to Associate Member.

Owing to the changed conditions affecting employment here, several members who are generally resident in Victoria have been away at other places during the greater part of the year.

Branch Activities

The activities of the Branch have comprised holding Regular Meetings, when Papers have been read and branch business conducted, luncheons at which either addresses on technical subjects have been delivered or some subject of general interest to the profession dealt with by different speakers.

In this regard I would mention that the Executive decided to invite all members of the Association of Professional Engineers who are not at present members of *The Institute*, to attend the lunches, and many have done so and have also expressed their appreciation for the consideration shown them.

Some of the papers and addresses which have been given dealt with the following subjects:—

Small Water Powers	J. B. Holdcroft, A.M.E.I.C.
Light Railways in France	H. Peters, A.M.E.I.C.
Electric Pumping for Irrigation	G. R. Alexander
Astronomy	Dr. Plaskett.
Wireless	F. P. Hill

Only one visit has been made during the year to the plant of Messrs. Yarrows Ltd., Esquimalt, but in the near future we hope to arrange for a series of visits to the new Dry Dock now under construction and also to the Dominion Govt. Astro-Physical Observatory.

Visitors

The Branch has been fortunate in that both the General Secretary of *The Institute*, Fraser S. Keith, and the President, J. M. R. Fairbairn, have visited the city in the year.

Mr. Keith was with us at lunch and also addressed the members at a regular meeting. We hope to have the pleasure of another visit some time during the coming year.

Unfortunately owing to the fact that he had only just previously recovered from a serious illness, the President was unable to meet the members collectively, but he did give a little of his time to discuss the affairs of *The Institute* with some members of your executive.

Branch members chosen for other positions

The Branch can congratulate itself in that several of its members have been chosen to act on different councils and committees. D. O. Lewis, M.E.I.C., formerly an active member of this Branch, and still considered as one of us, has been elected President of the Association of Professional Engineers of B. C. for the second time, and H. L. Johnston, M.E.I.C., our representative on the Council of *The Institute*, is also a member of the council of the same association of Professional Engineers.

P. Philip, A.M.E.I.C., has been appointed to act as provincial representative on *The Institute* Committee on Specifications for Good Roads. The appointment of a member to represent this branch on this committee is still to be made.

G. P. Napier, M.E.I.C., is a member of the Engineering Standards Committee on Steel Bridges.

Branch business

As indicating the relationship of the Branch to *The Institute* generally and to show the necessity for Branch organizations I would mention that during the period under review, not taking into consideration notices of meetings etc, about 460 letters have been received and

sent, dealing with such matters as legislation, remuneration, employment, applications for admission and transfer, and annual and professional meetings.

Journal

The Journal of *The Institute*, which shows continual improvement, now gives regularly in its pages some accounts of the work being done by this and other Branches. When any news of interest is available it is forwarded as a contribution to the Branch News, and the funds of the branch benefit to some extent from such copy.

It would be to the advantage of the Branch as a whole, as well as of interest to members individually, if items of news available for publication were forwarded to me for transmission to Montreal.

Branch dues

The question of the cost to members, of keeping up their subscriptions to various societies and keeping in touch with the technical literature published, is one calling for consideration. Apart from the fact that the remuneration of engineers is generally poor, it is quite expensive to be in the profession and keep up-to-date. I am of the opinion that this is the reason for the difficulty experienced in collecting Branch dues and also accounts for the absence from our meetings of some members. It would appear advisable that the question be given consideration.

In concluding I wish to express my thanks to the Chairman and members of the executive for their assistance and forbearance during this year, and the members for the readiness with which they have acted upon notices etc, and for their evident appreciation for my poor efforts.

Revenue

Fees from 1st Dec. 1920 to 30th Nov. 1921	$200.00

A. Long, Auditors.
December 8th 1921

Presented to the Annual Meeting of the Victoria Branch, December 14th 1921, and adopted.

Respectfully submitted,
H. M. BIGWOOD,
Secretary.

Vancouver Branch

The President and Council,

On behalf of the Executive Committee I beg to submit the following report.

Meetings

During the year 1921 the following meetings were held:—

Feb. 9—"**Town Planning**". Luncheon. Address by Thos. Adam, F.S.I. Attendance—45.

Feb. 25—**Water Supply Across the Sinai Desert for the Palestine Expeditionary Force**" Capt. T. W. Fairhurst, R.E., A.M.E.I.C. Attendance—60.

Mar. 24—**Luncheon. Address by S. L. Squire and Russel T. Kelley of the Canadian Good Roads Association** Attendance—50

April 8—**Dinner.** Guest, Fraser S. Keith, Secretary of the Institute. Attendance—39.

May 25—"**Administration of Vancouver Harbour**". Luncheon. Address by Lt. Col. Guy H. Kirkpatrick, D.S.O. Attendance—48.

June 8—"**Light Railways in France during the War**" Major W.G. Swan, D.S.O., M.E.I.C. Attendance,— 20.

Oct. 26—"**The Ballantyne Pier**" E. H. James, A.M.E.I.C., and Wm. Smail, M.E.I.C. Attendance—50.

On August 27th the Branch officers and those interested in paving work were the guests of the Provincial Public Works Department when the paving work on Lulu Island and in the Fraser Valley was visited. The Ballantyne Pier, the contractor's plant and yard were visited on 24th September.

The inauguration of luncheon meetings has proved a distinct success, both as regards the social side and the attendance, which was in excess of that at evening meetings. Difficulty has again been experienced in obtaining papers of sufficient interest to insure an attendance commensurate with the time for preparation and the cost of preparing slides.

The Executive Committee held eleven meetings during the year and two additional luncheon meetings.

Major Walkem and Professor Matheson attended the Western Professional meeting at Saskatchewan in August.

The Western Irrigation Convention held at Vernon was attended by two delegates from this Branch and a report on the proceedings was received from A. C. R. Yuill, A.M.E.I.C.

New Quarters

Considerable time was devoted to the obtaining of joint quarters. The new quarters in the Birks Building consist of four rooms, there being a general office, Board room, Secretary's Room, and Library. The following bodies are now housed in the new rooms: *The Institute*, the Association of Professional Engineers, The Architectural Institute of B.C., the B. C. Technical Association, Vancouver Sect. A.I.E.E., and the Chemical Society. The Library is undoubtedly better patronized since this arrangement was completed and its usefulness generally is much enhanced by the presence of Mr. Wheatley who has taken great pains to make the rooms as serviceable as possible. A valuable addition was made to the Library by Chas. Garden and the Branch is much indebted to Major Walkem for technical magazines.

British Columbia Technical Association

On 26th September the B.C.T.A. wrote this Branch requesting answers bearing on a suggested scheme whereby their members might join *The Institute*. This matter was very fully discussed by this Branch Executive and before an answer was drafted our President, Dr. Fairbairn, visited Vancouver, thus giving the Executive the viewpoint of Headquarters. The matter was then referred to Council and the reply received on 19th instant was submitted. The principle difficulties in the way of the scheme are the Association's request for the waiving of Entrance Fees and the difficulty some Technical Association members would meet with on account of lack of qualifications to enable them to gain corporate membership while their age might preclude them from entering in the junior grade.

It was a matter of very general regret that President Fairbairn was unable to meet the members at some general or social meeting, but he was scarcely recovered from a very severe illness, which caused him some anxiety while in the City.

Membership

It is rather difficult to compare the Branch membership year by year on account of the movement of Institute Members in B.C.

The present membership is:—

Members	51
Associate Members	86
Juniors	8
Students	11
Associate	1

During the year the Branch sustained a very great loss in the death of Messrs. F. F. Busteed, M.E.I.C., and W. J. Stuart.

Several members have left the Branch area. Major C.R. Crysdale A.J. Graham have gone to the Gold Coast, and Major LeR. Grant has gone to Kingston.

Several new members were admitted during the year and there have been additional members from other Branches.

Financial Statement

Branch Fees are provided for in the Branch By-laws, and of the 145 corporate and junior members only 44 have paid their current dues. Eight paid arrears for 1920. While admitting a multiplicity of fees, the proportion is exceedingly small.

The balance on hand is $209.16.

Branch News has brought in a very considerable sum, and it might bear repetition to state that this is a matter which the members should bear in mind. Matters of general interest and personal news should be sent to the Branch Secretary.

I wish to take this opportunity of thanking the Chairman, the Executive Committee and members for their help in my work, and to bespeak the same hearty co-operation for my successor.

J. N. Anderson,
Secretary-Treasurer.

Calgary Branch

The President and Council,

On behalf of the Executive Committee we beg to submit the following report for the period ending December 31st, 1921.

As our Branch year, previous to the amendment of the bye-law in January 1921, ended on November 30th, this report covers the period November 30th 1920 to December 31st 1921.

The first meeting was the Annual Meeting held on December 4th 1920 and the following officers were then elected:—

Chairman, G. N. Houston, M.E.I.C.,
Vice-Chairmen, P. Turner-Bone, M.E.I.C., G. W. Craig, M.E.I.C.,
Secretary-Treasurer, A. L. Ford., M.E.I.C.,
Executive Committee, F. W. Alexander, M.E.I.C., R. S. Trowsdale, A.M.E.I.C., C. C. Richards, A.M.E.I.C.
The appointed officers were:—
Assistant Secretary, J. J. Hannah, A.M.E.I.C.,
Auditors, F. K. Beach, A.M.E.I.C., W. J. Gale, A.M.E.I.C.,
Branch News Editor, F. K. Beach, A.M.E.I.C.

These officers under the new bye-law hold office until March 11th 1922.

In May Mr. Houston's official duties required his residence in Lethbridge and he resigned as Chairman, B. L. Thorne, M.E.I.C., being appointed to succeed him.

Mr. Hannah also moved to Lethbridge and was succeeded as Assistant Secretary by J. A. Spreckley, A.M.E.I.C.

Meetings

The executive held seventeen meetings at which the regular business of the Branch was transacted, special items being, the amendment of the bye-laws, compensation and remuneration of engineers, the function of the Provincial Institute of Technology now being erected in Calgary and the recommendation to the members of the

Provincial Government that a Highway Commission be appointed and that the engineering profession be represented thereon.

Fourteen general meetings were held at which there was on the whole a good attendance, a feature being the number of non members present at the open meetings.

The following is a list of these meetings:—

Dec. 4—"Annual Meeting".

Dec. 29—Special Meeting at Calgary Power House at which the members and the students from the University of Alberta were the guests of the City of Calgary. The subjects of the addresses were "**Electrical Distribution of the City of Calgary**", by R. A. Brown, M.A.I.E.E., City Electrical Engineer, Calgary. "**Cost of Operation of Power Plant**", by J. F. McCall, Chief Engineer Calgary Power Plant, and "**History and Purpose of The Engineering Institute of Canada**", by F. H. Peters, M.E.I.C., commissioner of irrigation, Calgary.

Jan. 21—"**The Lac La Range Expedition of 1920**", B. L. Thorne, M.E.I.C., mining engineer, Dept. of Natural Resources, C.P.R., Calgary. Smoker.

Feb. 4—"**Smokeless Powder**", G. N. Houston, M.E.I.C, Chairman of the Branch. Open Meeting with the Alberta Military Institute as guests.

Feb. 25—"**The Petroleum Situation**", Dr. J. A. Allan, University of Alberta, Edmonton. Open Meeting.

Mar. 3—"**Discussion of Report of Committee on Compensation and Remuneration**", P.J. Jennings, M.E.I.C, Chairman. Regular Meeting.

Mar. 18—"**Concrete**", Prof. G. M. Williams, M.E.I.C., of University of Saskatchewan, Saskatoon. Open Meeting.

April 1—"**Discussion of Amendment of Bye-laws**", Regular Meeting.

April 15—"**Dinner**". Gen. Secretary, Fraser S. Keith was guest of the Branch.

Oct. 4—"**Recent Developments in Concrete**", Lt. Col. Boyden, M.Am. Soc. C.E., of Chicago. Open Meeting.

Oct. 18—"**Special Luncheon**". Dr. J. M. R. Fairbairn, President of the Institute was the guest of honor.

Nov. 18—"**Engineering and Publicity**", C. O. Smith, editor of the "Herald" Calgary. Regular Meeting.

Dec. 2—"**Contracts in Relation to Corporations**", Alexander Hannah, Calgary. Regular Meeting.

Dec. 30—"**Annual Dinner**". P. L. Naismith, manager of the Dept. of Natural Resources, C.P.R., Calgary, R. B. Baxter, supt. of Alberta Government Telephones, Edmonton, Prof. R. S. L. Wilson of the University of Alberta, and the Students of the Provincial University were the guests of honor.

The Branch is indebted to the several speakers for contributing to the success of the programme and to the Programme Committee for the excellent entertainment provided and to the press of Calgary for its co-operation.

During the year F. H. Peters, M.E.I.C., a past chairman and very active member was lost to the Branch through his transfer to Ottawa. A. S. Dawson, M.E.I.C., who has always taken a very keen interest in the welfare of the Branch has been honoured by an appointment to the Senate of the University of Alberta.

Membership

The present Membership of the Branch is as follows:

28 Members
65 Associate Members
6 Juniors
4 Students
2 Associates
8 Affiliates of the Branch.

Total 113

During the year the gain in Membership to the Branch was:—

1 Member
17 Associate Members

and the loss in the lower grades:—

1 Junior
1 Student
1 Affiliate

Net gain 15

In the above statement the Members of the Calgary Branch who are now transferred to the newly formed Lethbridge Branch are shown as belonging to the old Branch. They will be written off our lists with the beginning of the new year.

This will decrease the number of full Members by four and Associate Members by three. It is to be noted however, in spite of this loss, that the Calgary Branch is entering 1922 with 106 members which is a stronger membership than at any time previous to 1921.

On behalf of the Calgary Branch we wish to express our best wishes for the success of the young branch which is, so to speak, our offspring.

The excellent condition as to membership is equalled by the splendid financial position of our Branch. The following statements are proof of this.

Financial Statement

Revenue

Balance on hand Dec. 1st, 1920	$620.22
Rebates for Parent Institution	215.44
Branch News	70.84

B. L. THORNE,
Chairman.

ARTHUR L. FORD,
Secretary-Treasurer.

Edmonton Branch

The President and Council,

On behalf of the Executive, we beg to submit the 1921 Annual Report covering the activities of the Edmonton Branch .

Membership

Members	8
Associate Members	44
Juniors	4
Students	3
Associates	1
	60

Six general, and seven executive meetings were held during the year. The early meetings were taken up largely with discussion relating to the classification and remuneration of engineers.

Two technical papers of general interest were read during the year, one by Prof. G. M. Williams, M.E.I.C., on "A logical method for determining the Concrete-making value available aggregate and its practical application to production of concrete in the field". The second paper was an illustrated paper on the "Geological investigations made in the Fort Norman area of the McKenzie River Basin", by F. H. Link, Imperial Oil geologist.

The Branch had a cash balance on hand December 31st, 1921, with accounts all paid, of $69.87.

The officers for the year were:—

Chairman.............D. J. Carter, A.M.E.I.C.
Vice-Chairman.........A. W. Haddow, A.M.E.I.C.
Secretary-Treasurer.....C. C. Sutherland, A.M.E.I.C.
Executive:.............R. W. Ross, A.M.E.I.C.
J. D. Robertson, A.M.E.I.C.
E. Kells Hall, A.M.E.I.C.
Prof. R. S. L. Wilson, A.M.E.I.C.

The officers elected for the year 1921 and 1922 were:—

Chairman.............C. A. Robb, A.M.E.I.C.
Secretary-Treasurer.....R. H. Douglas, A.M.E.I.C.
Executive:.............Lt.-Col. Reid, M.E.I.C.
R. W. Jones, M.E.I.C.
H. H. Tripp, A.M.E.I.C.
C. F. Corbett, A.M.E.I.C.
A. G. Stewart, A.M.E.I.C.
Ex-Officio..........D. J. Carter, A.M.E.I.C.

Respectfully submitted,

C. A. ROBB,
Chairman.

R. H. DOUGLAS,
Secretary-Treasurer.

Lethbridge Branch

The President and Council,

On behalf of the Executive Committee I beg to submit the following report.

Following the granting of the petition for the formation of the Lethbridge Branch a meeting was held on Dcember 3rd to complete the organization and for the election of officers, the following being elected:—

Chairman, S. G. Porter, M.E.I.C.,

Secretary-Treasurer, C. M. Arnold, M.E.I.C.

Executive Committee:

G. N. Houston, M.E.I.C.,

C. D. Mackintosh, A.M.E.I.C.,

H. W. Meech, A.M.E.I.C.

The Branch starts off with a corporate membership of seventeen and one junior with four probable corporate members additional being now dealt with.

Subsequently the Executive Committee discussed plans for the Branch promising an active winter of meetings to start after the New Year.

Respectfully submitted,

C. M. ARNOLD,
Secretary-Treasurer.

Saskatchewan Branch

The President and Council,

On behalf of the Executive Committee we beg to submit the following report for the calendar year 1921. As the Branch year ends on February 28th., the period covered by this report refers to part of two Branch years, the activities of which were controlled by different Executives.

The outstanding feature of this year's programme was the Western Professional Meeting held at Saskatoon August 10th. to 12th., inclusive, which was carried out to a successful conclusion under the auspices of the Saskatchewan Branch. As full reports of the Meeting have appeared in *The Journal* little remains to be said but we wish at this time to express the appreciation of this Branch to the various Western Branches who helped to make this Meeting such a pronounced success.

While much more might have been accomplished, 1921 has been a banner year for the Saskatchewan Branch. The membership shows a satisfactory increase as may be seen from the attached statement, there being an increase of 19.3% of the total membership. Finances are in a healthy condition as may be seen from the statement covering the period from March to December 31st. 1921.

The Branch meetings have been well attended when it is considered that our membership is scattered throughout the whole of the province making it impossible for the majority of the members to attend many meetings. The social event of the year was a dinner dance held in February to which the outside members were guests of the Regina members, and it was pronounced by all to be well worth making an annual event. During 1921 nine regular and special meetings have been held, the majority of which were preceded by a Dinner at 6.30 P.M. The average attendance for the meetings was thirty-two particulars of which are as follows:—

Jan. 13—"Bridges", A. P. Linton, A.M.E.I.C.
Feb. 10—"Dinner Dance".
Mar. 8—Annual Meeting.
April 22—Address on "Society Affairs", Fraser S. Keith, M.E.I.C., General Secretary.
July 20—"The Manufacture and Use of Reinforced Concrete Pipe for Water Supply", W. G. Chace, M.E.I.C. Illustrated Lecture on.
Sept. 29—"Recent Developments in Concrete", Lt. Col. H. C. Boyden, M.A.S.C.E. Illustrated Lecture on.
Oct. 13—"Publicity", R. N. Blackburn, M.E.I.C.
"Classification", H. S. Carpenter, A.M.E.I.C.
"Remuneration", J. McD. Patton, A.M.E.I.C.
"Engineering Profession", H. R. Mackenzie, A.M.E.I.C.
Nov. 10—"Some Notes on Street Railway Operation", D. W. Houston, A.M.E.I.C.
Dec. 8—"The Practice and Principles of Taxation", L. A. Thornton, M.E.I.C.

While the Branch was disappointed in not being successful in securing legislation at the last Session of the Provincial Legislature we hope for better results in the near future. An active Legislation Committee have the matter in hand and the Legislature is now in Session.

A visit from our President, J. M. R. Fairbairn, M.E.I.C., was looked forward to with considerable interest as it was hoped that conditions would allow him to stop over while in the west last fall. Unfortunately through a series of unavoidable circumstances he was only able to meet a few of the members as he was passing through after having been hurriedly called East.

Winnipeg Branch

The President and Council,

On behalf of the Winnipeg Branch we beg to submit the following Report for the year 1921:—

Membership

Our membership has increased from 295 to 316, being an increase of 7.1%. The membership is distributed as follows:—

Members	50
Associate Members	168
Juniors	32
Students	35
Associates	5
Local Affiliates	26
	316

It will be noted by comparison with last year's report the increase is almost wholly due to the increase in Student Membership.

The following have been removed from the jurisdiction of this Branch through change in the location of the practice of their several professions:—

Members:—E. Brydone-Jack, F. L. Butler, G. H. Burbidge, W. J. Dick, F. H. Farmer, G. H. Herriot, W. M. MacPhail, A. W. Smith and J. M. Street.

Associate Members:—F. X. Amoss, C. K. Brown, C. F. Gray (temporarily).

Juniors:—H. V. Carman.

It is with regret that we record the loss of one of our esteemed members by death, Byron Hallock.

Meetings

The Branch has held sixteen meetings during the year, as follows:—

Date	*Subject*	*Speaker*	*Attendance*
1921			
Jan. 6	The Economics of the Transportation and marketing of the Canadian Wheat Crop	W. Sanford Evans	51
Feb. 3	Publicity	James Quail	31
Feb. 17	Highway Bridges in Manitoba	P. Burke-Gaffney.	72
Mar. 3	Electricity for Domestic Heating	E. V. Caton	85
Mar. 17	House Heating in Western Canada	G. R. Pratt	62
April 7	Regulation of the Winnipeg River	C. H. Attwood	84
April 28	The Electrical Furnace in the Industrial Field	F. H. Martin	74
	—Conservation of Energy—(Satirical)—	Wm. C. Taylor	
May 5	Annual Meeting		53
Sept. 1	Report of Western Professional Meeting	Prof. J. N. Finlayson, M. A. Lyons, W. M. Scott	34
Sept. 15	Searching for Oil in the Canadian Arctics	Chester Bloom	61
Sept. 28	Concrete Roads and Pavements	H. C. Boyden	46
Oct. 20	The Mall	Harold Edwards, G. B. McColl	60
Nov. 3	Ethics of the Engineering Profession	Prof. R. C. Lodge	48
Nov. 16	Town Planning	W. C. Hobbs	38
Dec. 1	PulpandPaperManufacture —Illustrated by Films of Price Bros. Operations	D. A. Ross	68
Dec. 15	Foundations in and Around Winnipeg	Harold Edwards, P. Burke-Gaffney.	88

The average attendance at regular meetings held during the year was 60, being an increase of 7 over that of last year.

Last April the Branch was favoured by a visit from the General Secretary. During his stay he imbued the members with interest in the affairs of *The Institute.* He addressed the regular meeting on April 28, and spoke at a luncheon in his honour held at the Fort Garry on April 29. General comment is to the effect that there should be more visits from Officers of *The Institute.*

The Branch has taken considerable interest in civic problems, the most important being the considerations affecting the proposed Mall. A special committee was struck to assist the Mayor with advice on problems arising out of negotiations.

W. E. Hobbs, A.M.E.I.C., was appointed commissioner of town planning for the Province.

Ontario Provincial Division

The President and Council,

On behalf of the Ontario Provincial Division, and pursuant to the direction of By-Law No. 63, we beg to submit the following report for the calendar year 1921.

1.—The Membership of the Division consists, in accordance with *The Institute* By-Laws, of all the members of *The Institute* that are resident in Ontario. The total is approximately 1650, divided about as follows, viz:—

Corporate Branch Members	945
Non-Corporate Branch Members	450
Corporate Non-Resident Members	165
Non-Corporate Non-Resident Members	100
	1650

2.—The Executive Committee of the Division consists of the following, in accordance with the Division By-Laws, viz:—

The Ontario Councillors. (Nine)

The Honorary Councillors resident in Ontario. (Two)

One Representative from each Branch. (Eight)

One Representative per 25 Non-Resident Corporate Members. (Six)

The immediate Past Chairman of the Division.

The immediate Past Secretary-Treasurer of the Division.

A detail list of the personnel is contained in each month's issue of *The Journal.*

3.—The Executive Committee has held two meetings during the year, with an average attendance of 12 members, copies of all Minutes being duly forwarded to Council, as called for by *Institute* By-Law No. 63. In addition to the business transacted at the above meetings a considerable amount of detail has been attended to in the course of the year by correspondence.

4.—The most important question with which the Division Executive has been concerned during the year is that of a Professional Engineering Act for the Province of Ontario. To handle this question, as we reported last year, late in 1919 the Division joined with:—

The American Institute of Electrical Engineers, Toronto Section.

The American Society of Mechanical Engineers, Ontario Section.

The Association of Ontario Land Surveyors.

The Canadian Institute of Mining and Metallurgy.

The Canadian Society of Chemical Industry, and

The Ontario Association of Architects,

in forming a combination committee, known as the Advisory Conference Committee, and consisting of two representatives from each of the seven subscribing bodies. Later on the Architects withdrew their membership, thinking it would better suit their needs if a separate Architectural Act were introduced by them, which has since been done. The balance of the Advisory Conference Committee prepared a draft Bill, a copy of which is enclosed, amended to date, and had it introduced in the Ontario House in April last. Shortly after it was referred to a Special Committee thereof for consideration and report, together with the Architectural Bill, but before the Committee had time to report the House adjourned. The work however is actively in hand in preparation for next session, when it is trusted that the Advisory Conference Committee, backed by all the members of its constituent organizations, will succeed in getting a bill through.

5.—In this connection we would like to express the Division's appreciation of the action of the Toronto Branch Executive in forming itself into a local Committee to assist the Division representatives on the Advisory Conference Committee with their part of the work. There is a tremendous amount of detail to be attended to, and the advice and assistance of such a local committee will undoubtedly be a great help.

6.—Further, we would like to emphasize again the great value of such a body as this Advisory Conference Committee as not only the best means of handling any matter affecting a number of professional organizations, but also as the best possible method of bringing such organizations together in a way that gives each and all of them the most complete understanding and appreciation of the aims and methods of each of the others.

7.—Re finances, thanks to the kindness of Council in advancing us the sum of $400.00, coupled with the fact that up to date the outlay regarding legislation has not been as large as was anticipated, our financial situation has not been as difficult this year as it was during 1920. At date, assuming that all accounts were cleared away, both actual and prospective, we would have a cash balance of about $10.00. A copy of the statement presented to our last Executive meeting is enclosed herewith.

8.—Lastly, we would like to take this opportunity of expressing, on behalf of all the Ontario members of *The Institute* outside of Toronto, their sincere appreciation of the Professional Meeting arranged and financed by the Toronto Branch in February last. It was exceedingly much enjoyed by all those attending, both professionally and personnally, great credit and many thanks are

due to each and all of the members of the Toronto Branch for the very fine programme they presented and the excellent way in which it was carried out.

Respectfully submitted,

W. H. WAGWOOD,
Chairman.

W. A. MCLEAN,
Vice-Chairman.

A. B. LAMBE,
Secretary-Treasurer.

Sault Ste. Marie Branch

The President and Council,

I beg to submit herewith the Annual Report of the Sault Ste. Marie Branch for the year ending December 31st, 1921.

Membership

The past year has seen the Branch membership increase from twenty-two to twenty-nine. Eleven new members were elected to membership in the E.I.C. within our district and there were four removals, making an increase of seven.

During the early summer an aggressive membership campaign was started here and our efforts were brought to a focus at our First Annual Dinner held at the Country Club, June 28th. Over forty guests and members were present. The President of *The Institute*, J. M. R. Fairbairn, M.E.I.C., and the Secretary, Fraser S. Keith, M.E.I.C., were the guests of honour. All engineers resident within our district were invited to be present. Those who were not already members of the E.I.C. had previously been approached with a view to securing their applications for admission. We have not a large field to work upon, and the resulting increase of eleven members is a creditable showing. There are still a number of applications pending. Our policy is to bring into *The Institute* as Associates men holding executive positions in the engineering and allied industries when their occupations come within the scope of *The Institute's* objects.

Financial Statement

The Branch statement of receipts and disbursements for the year ending December 31st 1921, is as follows:—

Balance on hand, Jan. 1st, 1921...........		$ 80.33

None.

Meetings

The Officials of the Algoma Steel Corporation have very kindly placed their Board Room at our disposal for a place of meetings. Use was made of it nine times during the past year. Two meetings were held in other places, as noted in the following program of meetings held during the year.

- Jan. 6—**Discussion of the Draft Bill respecting Professional Engineers in Ontario.**
- Jan. 26—**"Decay in Timber,"** G. L. Durgin, research engineer with the Spanish River Pulp & Paper Co.
- Mar. 3—**"The Oxidation of Coal in Storage Piles,"** Wm. Seymour, M.E.I.C., illustrated with stereopticon views, and held in the Steel Plant Club.
- Mar. 24—**"Results of an Explosion in a Blast Furnace and the Methods adopted to Repair the Damage, and to Prevent a Recurrence of Another,"** B. E. Barnhill, M.E.I.C.
- April 28—**Motion Picture, "From Spruce to Newsprint,"** loaned by the Spanish River Pulp & Paper Co., exhibited in St. John's Hall.
- May 26—**"Mining Methods in Algoma,"** Geo. Cowie, Superintendent of Dept. of Mines, Algoma Steel Corporation.
- June 30—**Annual Meeting of Branch.**
- Sept. 29—**"The Construction of the Algoma Central and Hudson Bay Railway,"** R. S. McCormick, M.E.I.C.
- Oct. 27—**"Handling of Steel Plant Raw Materials,"** Carl Stenbol, M.E.I.C.
- Nov. 24—**"Relationship between Engineering and Financing in a Large Corporation,"** E. Carey, Comptroller of the Algoma Steel Corporation.
- Dec. 15—**Discussion on "Proposed St. Lawrence Canal and Power Development",** led by J. W. LeB. Ross, M.E.I.C., and G. H. Kohl, A.M.E.I.C.

The local press has shown much interest in our activities and publishes full reports of our meetings, including summarized accounts of the papers read.

Although our Branch is not numerically large, considerable discussion has been aroused at our meetings and an effort is being made by our Papers and Publicity Committee to submit papers of more general interest than in the past, on account of the diversified interests of our members. The attendance at meetings has been encouraging and men of affiliated callings are becoming interested in our attitude on engineering matters as is evidenced by the number who attend as guests. We have a fairly large field to draw on in the local steel, pulp and paper and power industries. A programme has been outlined for the winter and spring that we think will prove of increasing interest to our members and affiliates.

Public Interests

A Committee on Town Planning has been formed for the purpose of studying Town Planning principles and legislation, particularly with reference to their application to the city of Sault Ste. Marie. It is our intention to stimulate public interest in the Sault in a City Planning movement. Already we have secured the promise of cooperation and support from a number of local public bodies.

Respectfully submitted,

F. THEO. GNAEDINGEK,
Secretary-Treasurer.

Border Cities Branch

The President and Council,

The Executive of the Border Cities Branch beg to submit the following Annual Report for the current year, ending December 31st, 1921.

Meetings

Regular meetings held	8
Special meetings held	1
Average attendance	20
Executive meetings held	8
	37

Date	Subject	Speaker
Jan. 14	Super Cement	Capt. F. M. Dawson, A.M.E.I.C.
Feb. 11	Engineering Education	Prof. T. R. Loudon, M.E.I.C.
April 15	Richibuctu Breakwater	Major A. A. Anderson, Jr.E.I.C.
May 13	Park Scheme for the Border Cities	J. B. C. Keith, A.M.E.I.C.
Oct. 14	Steel Plants	W. H. Baltzell, M.E.I.C.
Nov. 17	Hydro	O. M. Perry, M.E.I.C.

Paper presented to **Journal** by D. A. Molitor, M.E.I.C., on **Metric System.**

The Border Cities Branch has had an active year, and has been regularly represented at the Ontario Provincial Division, and at the Annual Meeting of *The Institute.*

The average attendance has shown twenty-five percent increase over the year 1920 and the finances of the Branch show considerably better, in that we have a balance in the bank on December 31st, 1921, of $126.31, as against a balance on hand December 31st, 1920, of $31.50.

While the Branch has suffered a severe set back in membership this past year, from the fact that thirteen members have moved to points outside the Branch jurisdiction, through the efforts of your Membership Committee and Executive, our membership is greater than one year previous by 6%. Indications also point to further increase in the next few months.

The executive has met regularly throughout the year for the transaction of *Institute* business.

Report of Ontario Provincial Division Representative
(To Branch at Annual Meeting)

There has been no meeting of the Ontario Provincial Division since my appointment. Very few letters have been exchanged between the Secretary of the Division and myself. A meeting has been called, to be held in the Engineers' Club, Toronto, on the 17th inst. The agenda consists of:—

1. Reading and confirming minutes of last Annual Meeting.
2. Financial statements.
3. Report on Ontario Engineering legislation situation.
4. Draft division report as called for by *Institute* by-law No. 63.
5. New business.

Section 3 seems to be the only one calling for special attention, and as H. B. R. Craig, M.E.I.C., our past chairman, is one of the division representatives, I think he will be able to give this subject full consideration and hence do not think it necessary to go to Toronto for the meeting, unless something new developes.

Report of Advertising Committee

The securing of advertising is worthy of the energies of any Branch and when vigorously pursued is a direct source of revenue. Industrial conditions in the Border Cities, in keeping with other centres, did not reach the high level shown in the immediate preceding years and this had a definite bearing on advertising appropriations. The territory was covered by a special representative of *The Journal* of *The Institute* this year but we hope that the incoming year will see a more aggressive policy pursued by the committee in charge than was in evidence last year.

London Branch

The President and Council,

On behalf of the Executive Committee I beg to submit the following report:—

The initial proceedings to form London Branch were taken on October 20th, the preliminary meeting being called by H. B. R. Craig, M.E.I.C., and H. A. Brazier, A.M.E.I.C. On October 26th, a general meeting of all engineers in the district was held at Tecumseh House to discuss the formation of the Branch and it was unanimously decided to proceed with the organization, the committee charged with this work having H. B. R. Craig, M.E.I.C., as Chairman, and Colonel E. I. Leonard, M.E.I.C., as Secretary.

Following authorization by Council the organization meeting was held on November 16th; a full report of this meeting has been published in *The Journal.* The executive elected for the balance of 1921 was as follows:—

Honorary Chairman, Dr. J. Davis Barnett, M.E.I.C.
Chairman, H. A. Brazier, A.M.E.I.C.
Vice-Chairman, W. J. Forbes-Mitchell, A.M.E.I.C.
Secretary-Treasurer, Geo. C. Wright, A.M.E.I.C.

Executive Committee:— F. A. Bell, Jr., A.M.E.I.C., Chas. Talbot, A.M.E.I.C., F. J. Ure, A.M.E.I.C., A. H. Smith, M.E.I.C.

A regular meeting was held on December 21st. The report of this meeting will be found in the Branch News Section of the Section of the February *Journal.*

Respectfully submitted,

Geo. C. Wright,
Secretary-Treasurer.

Niagara Peninsula Branch

The President and Council,

On behalf of the Executive Committee we beg to submit the third annual report of the Branch.

Meetings

During the year the Branch has held six general meetings, three executive meetings, two trips of inspection and a dance. Four speakers addressed the Branch, one meeting concerned legislation for the Province of Ontario and in May the Annual meeting marked the Branch's third birthday.

This year's Executive have decided that a meeting should be held once a month during the Fall and Winter and that these should always be dinner meetings and held alternately in St. Catharines and Niagara Falls. The two meetings held this season and one last season seem to have shown the wisdom of this decision because the attendance and general enjoyment of the dinner meetings is much more marked than otherwise. Another new feature is the introduction of a song sheet at the dinner meetings under the able direction of Messrs. Frost and Blanchard.

Legislation

The principal item of business before the Branch during the year has been the question of legislation for Ontario. In March a general meeting was called to discuss this matter and with the assistance of the Branch legislation committee and one of the members of the Advisory Conference Committee, a thorough explanation was made of the Bill Respecting Professional Engineers and the meaning of its various features and resulted in the members of the Branch giving their approval to the Bill as prepared by the Advisory Conference Committee and as introduced in the Legislature.

Papers

With regard to the nature of papers presented at the meetings of this Branch, it has been the aim of the Executive to secure, as far as possible, subjects of a wide and general interest, having a bearing on national and international affairs, rather than obtaining papers upon specific engineering problems. It is felt that in this way the many varied specializations of the profession making up the personnel of the Branch can be better served and in this way a wider interest taken in the meetings.

On October 8th an interesting gathering took place when the Engineering societies of Buffalo and Rochester joined with the Branch in making a trip of inspection over the Queenston-Chippawa Power Development and later in the day joining in a fraternal gathering with an international touch, at dinner in Buffalo.

In January last, a very successful and enjoyable social gathering was held in the form of a dance at the Clifton Hotel, Niagara Falls, Ont.

Membership

The membership has increased during the year from one hundred to two hundred and thirty-three with eight applications for membership. The number of members in each classification is shown as follows:—

	1920	1921
Members	16	19
Associate Members	58	74
Associates	7	2
Juniors	11	20
Students	7	17
Affiliates	1	1
	100	133

The finances of the Branch are in a satisfactory condition with some four hundred dollars in the bank.

Respectfully submitted,

N. R. Gibson,
Chairman.

R. P. Johnson,
Secretary-Treasurer.

Hamilton Branch

The President and Council,

On behalf of the Executive Committee we beg to submit the following report. The Branch year extends from 1st June to 31st May, so that there are two executives in the year.

Meetings

The following meetings were held:—

Jan. 28—"**Legislation,**" Willis Chipman, M.E.I.C. The meeting approved of the proposed act and suggested that every effort be made to have it put through the present session.

Feb. 18—"**Radio Engineering,**" S. M. Kitner, vice-president of the International Radio Telegraph Co. This was a joint meeting with the Toronto Branch of the American Institute of Electrical Engineers, as guests of the Canadian Westinghouse Co. Refreshments were served. There was a record attendance of 175.

Mar. 23—"**Town Planning**", J. W. Tyrrell, M.E.I.C., delegate to the Toronto Convention, gave his report, J. J. Mackay, O.L.S., M.E.I.C., a member of the Town Planning Commission and the Wentworth Road Commission, spoke on Road and Boulevards and what they mean to Hamilton. This was published in the Journal for August P-470.

May 6—"**Annual Meeting**", Reports presented and Nominating Committee elected.

Nov. 1—"**St. Lawrence Route**". The Branch was invited to attend a banquet given by the Chamber of Commerce to the delegates of the Canadian Deep Waterways and Power Association. Henry I. Harriman of Boston, gave an inspiring address.

Nov. 24—"**Annual Banquet at the Royal Connaught Hotel,**" Brig.-Gen. C. H. Mitchell, D.S.O., M.E.I.C., dean of the Faculty of Applied Science of the University of Toronto was guest of honour and gave an address on the Engineering Profession. There was an attendance of 110 members and friends.

Dec. 16—"**Achievements of Sir Sandford Fleming**", Prof. P. Gillespie, M.E.I.C.,. Following this, there was a discussion on Institute affairs.

Toronto Branch

The President and Council,

On behalf of the Executive Committee I beg to submit the following report of the activities of the Toronto Branch from 1st January, 1921 to 31st December, 1921.

In the first two months of the year we directed attention mainly to the Annual Convention which was held in Toronto early in February and of which such full account was given in *The Journal* that need not be elaborated on here.

During the Spring and Fall meetings were held weekly at which papers and addresses were given — the endeavour being to distribute the subjects through the various branches of Engineering, such as Electrical, Mechanical Chemical, Mining and Civil. This was found very effective and much appreciated. In all 25 regular meetings and 17 executive meetings were held.

In the Spring, visits of inspection were made to the New Union Station, Toronto Harbour Works, Chippawa Power Canal and others, which were very well attended.

Meetings

The following meetings were held:—

- Jan. 6—**General Meeting.**
- Jan. 13—**"Superheaters and Economizers,"** F. A. W. Taylor.
- Jan. 20—**"Reservoirs,"** (illustrated), W. Gore.
- Feb. 1—2—3—**Annual Convention E.I.C.**
- Feb. 10—**"Toronto Gas Works,"** Arthur Hewitt.
- Feb. 17—**"Forms for Concrete,"** T. T. Black.
- Feb. 24—**"New Theory of Concrete Mining and its Use in Large Work,"** R. B. Young and T. V. McCarthy.
- Mar. 3—**"Formation of Ice and its Prevention,"** John Murphy.
- Mar. 10—**"Design of Centrifugal Pumps,"** A. T. Clark and I. M. Jones.
- Mar. 17—**General Meeting.**
- Mar. 24—**"Engineers and Sociology,"** F. M. Crossley.
- Mar. 31—**"Pulp and Paper Works,"** C. Nelson Goin.
- April 7—**"History of Canals in Canada,"** G. T. Clark.
- April 14—**"Engineers and Contractors,"** W. E. Douglas.
- April 21—**General Meeting.**
- April 28—**Annual Meeting.**

Membership

The membership of the Branch is as follows:—

Members	115
Associate Members	251
Associates	6
Juniors	4
Students	103
Total	490

Financial Statement

The following is the financial statement of the year, Jan. 1st, 1921, to Dec. 31st, 1921.

Peterborough Branch

The President and Council,

On behalf of the Executive Committee we beg to submit the Annual Report of the Peterboro Branch for the Calendar year of 1921.

Meetings

Teelve meetings were held during the year a list of which follows:—

- Jan. 13—**"Power Developments on the St. Maurice River",** P. S. Gregory M.E.I.C., of Montreal, electrical engineer for the Shawinigan Water & Power Co.
- Feb. 17—**"Reservoirs",** Wm. Gore, M.E.I.C., consulting engineer, Toronto.
- Feb. 24—**"The Welland Ship Canal," Alex J. Grant,** M.E.I.C., chief engineer of the Welland Ship Canal.
- Mar. 10—**"Oil Refining Practice,"** Clayton D. Dean, A.M.E.I.C., of the Imperial Oil Company.
- Mar. 24—**"Pulp and Paper Mfg.",** P. P. Westbye, M.E.I.C., general manager of the Wm. Hamilton Co. Ltd., Peterboro.
- April 14—**"The Hydro Electric Development at Queenston,"** A. D. C. Blanchard, M.E.I.C., chief field engineer, for the H. E. P. C. on the Chippawa Development
- April 28—**"The Regulation of the Run Off from the Upper Trent Watershed and the Possibilities of Further Conservation,"** A. L. Killaly, A.M.E.I.C., superintendent of the Trent Canal.
- Oct. 13—**"The Complex Nature of a Modern Telephone System,"** Norwood M. Lash, chief engineer of the Bell Telephone Co. of Canada.
- Oct. 27—**"Municipal Sewage Disposal,"** Prof. Peter Gillespie, M.E.I.C., of Toronto University.
- Nov. 10—**"The Construction of 140 miles of Sewers in Vancouver,"** A. G. Dalzell, M.E.I.C., for a number of years city engineer of Vancouver.
- Nov. 17—**"Annual Banquet".**
- Dec. 8—**"Automatic Stations"** G. R. Langley, M.E.I.C., Switchboard engineer for the Canadian General Electric Co., Ltd.

The attendance at the meetings averaged 45, which shows a slight increase over the previous year.

Membership

The membership of the Branch is as follows:—

Members	15
Associate members	24
Juniors	6
Associates	2
Affiliates	24
Total	73

During the last year the Branch had occasion to use a motion picture machine frequently, so it was decided to purchase one for their own use. Now both a motion picture machine and a lantern are available for use when required. This factor has added very much to the interest taken by the members in the regular semi-monthly meetings which are held from October to April inclusive.

We are attaching the financial statement for the Calendar year 1921.

Statement

Revenue

Balance in Bank Jan. 1, 1921	$52.31
Rebates Journal News, etc	134.29
Affiliate Fees	76.00
Annual Dinner	165.00
Balance from Sisson Dinner	5.55
Bank Interest	.73
	$433.88

Expenditures

Rent	$50.00
Lantern Service	10.00
Lunch (Smoker)	10.35

Expense of Annual Dinner	158.26
Printing	77.66
Speakers' Expenses	8.00
Postage, War tax, etc	6.09
Y.M.C.A. Lantern Purchase on Acct	60.00
Balance in Bank Jan. 1st, 1922	14.47
Chairman's Expenses to Provincial Meeting	4.80
	$433.88

Respectfully submitted,

P. L. ALLISON,
Chairman.

D. L. MCLAREN,
Secretary.

Kingston Branch

The President and Council,

On behalf of the Executive Committee, we beg to submit the following report for the calendar year of 1921.

Meetings were held twice a month on a Tuesday evening at 8 P.M. during the University session. At the first meeting of the Autumn session, the second and fourth Tuesday was chosen as the ones on which professional meetings were to be held. The attendance at all meetings has been of a high average and the interest shown by the student and junior members has given the executive a valuable assistance.

Meetings

Twelve professional meetings were held during the year a list of which is given below:—

Jan. 16—**"Rubber Tire Industry"**. Discussion H. W. Nicoll, educational director of the Goodyear Tire and Rubber Company Limited.

Feb. 15—**"Recent Developments in Concrete,"** Col. H. C. Boyden of the Portland Cement Company.

Feb. 8—**"Economical Design of High Tension Lines,"** W. P. Dobson, M.E.I.C., research engineer of the Ontario Hydro-Electric Power Commission.

Feb. 15—**"Snow Fighting,"** W. H. Winterrowd, A.M.E.I.C., mechanical engineer of the Canadian Pacific Railway.

Mar. 15—**"Fog Signalling,"** Prof. L. V. King, professor of physics, McGill University, Montreal.

April 15—**Annual Dinner at the Frontenac Club, Kingston.** Each member present made a short speech.

Sept. 30—**Business Meeting and Smoker.** Installation of Officers for the session 1921-22.

Oct. 13—**"Prof. Einstein's Theory of Relativity and Gravitation,"** L. T. Rutledge, M.E.I.C., Queen's University.

Oct. 25—**"Cost Keeping as Practised in the Kingston Locomotive Works,"** Wm. Casey, general manager of the company.

Nov. 8—**"Queen's New Heating Plant"**, W. P. Wilgar, M.E.I.C., and L. M. Arkley, M.E.I.C., Queen's University, both of whom were consulting engineers on the design and construction.

Nov. 23—**"Life and Career of Sir Sandford Fleming,"** Prof. Peter Gillespie, M.E.I.C., of the University of Toronto.

Dec. 13—**"The Iron Ores of Canada"** by Prof. Stanley Graham, professor of mining, Queen's University.

Membership

The approximate membership of the Branch is as follows:—

Members	7
Associate Members	21
Junior Members	7
Student Members	16
Associates	1
Affiliates	3
Total	55

As this report covers the activities of two executives the members of both executives are given below:—

1920-21

Chairman,	J. M. Campbell, M.E.I.C.,
Vice-Chairman,	A. Macphail, M.E.I.C.,
Secretary-Treasurer,	W. P. Wilgar, M.E.I.C., Dr. A. L. Clarke, M.E.I.C., L. M. Arkley, M.E.I.C., D. Ellis, M.E.I.C.

1921-22

Chairman,	W. P. Wilgar, M.E.I.C.,
Vice-Chairman,	L. M. Arkley, M.E.I.C.,
Secretary-Treasurer,	L. T. Rutledge, M.E.I.C., J. M. Campbell, M.E.I.C., D. J. Emery, M.E.I.C., A. Macphail, M.E.I.C.

The following is a financial statement for the year 1921.

Revenue

Jan.	1	Cash on Hand	$59.00
Jan.	25	Rebate from fees	63.14
Apl.	9	Sale of dinner tickets	38.00
June	27	Rebate for fees	17.00
		Receipts from Branch News	9.45
Aug.	22	Rebate for fees	30.00
Nov.	18	Rebate for fees	14.50
		Receipts for Branch News	5.00
Dec.	31	Accounts Receivable from Headquarters as per advice	23.11
			$259.20

Expenditures

Jan.	1—Oct. 1	Disbursements	$109.81
Oct.	1—Dec. 31	Disbursements	43.15
			$152.96

Balance on hand Dec. 31st, 1921 $106.24

Respectfully submitted,

W. P. Wilgar,
Chairman.

L. T. Rutledge,
Secretary-Treasurer.

Montreal Branch

The President and Council,

On behalf of the Executive Committee we beg to submit the following report. The activities of the Montreal Branch during the calendar year 1921 have been carried on under two separate Executive Committees, the elective personnel of which were as follows:—

June 1920 to May 1921		June 1921 to December 1921
Arthur Surveyer,	Chairman	J. H. Hunter,
J. H. Hunter,	Vice-Chair.	J. A. Duchastel,
J. L. Busfield,	Sec.-Treas.	J. L. Busfield,
K. B. Thornton,		John T. Farmer,
J. A. Duchastel,		George R. MacLeod,
S. F. Rutherford,		O. O. Lefebvre,
George R. MacLeod,		A. E. Dubuc,
John T. Farmer,		Chas. M. McKergow,
O. O. Lefebvre,		S. F. Rutherford,

In addition to the foregoing, the local members of Council and the immediate Past Chairman of the Branch were ex-officio members of the Committee.

On account of the change of the Branch year, which will in future conform to the calendar year, the Executive Committee under the chairmanship of J. H. Hunter, M.E.I.C., has been in office for only six months, being for the period ending December 31st, 1921.

The Executive Committe has held meetings at frequent intervals throughout the year and in addition to discussing and making arrangements for routine Branch matters, such as the arrangements for meetings, recommendations to Council regarding applicants for admission to *The Institute,* and appointment of various committees, has devoted its attention to a number of matters involving the welfare of the members of the Montreal Branch. Among these matters may be cited the revising of the Branch by-laws; correspondence with the Chairman of the Canadian National Railways Board regarding employment of members of *The Engineering Institute* in engineering positions; co-operation with the Builder's Exchange regarding Quebec building laws; recommendation regarding proposed meeting of Branch Secretaries, and other matters of local interest.

Applications were received during the year for the formation of a Railway and a Marine Section. These two applications were favourably received, making the list of sections of the Montreal Branch as follows:—

	Chairman 1920-21	*Chairman* June to Dec. 1921
Civil Section	O. O. Lefebvre	S. Fortin
Mechanical Section	John T. Farmer	F. A. Combe
Electrical Section	G. K. McDougall	C. J. DesBaillets
Industrial Section	S. F. Rutherford	S. F. Rutherford
Railway Section	. . .	P. B. Motley
Marine Section	. . .	N. E. McClelland

Reception Committees under the chairmanship of George R. MacLeod, M.E.I.C., and Charles M. McKergow, M.E.I.C., were appointed for the two periods. They have carried on their duties at the regular meetings and have given great assistance, not only in enhancing the social atmosphere of the meetings, but also in making valuable suggestions from time to time regarding ways and means of making the meetings attractive.

Membership

There has been a healthy increase in the membership of the Montreal Branch as indicated by the following figures:—

	Dec. 31st, 1920	Dec. 31st, 1921
Honorary Members	3	2
Members	150	181
Associate Members	308	359
Juniors	59	69
Students	184	268
Associates	11	8
Branch Affiliates	12	17
Totals	727	904

A Committee was appointed early in 1921 by the Executive Committee for the purpose of approaching a number of engineers resident in Montreal who, though fully qualified, had not applied for admission to *The Institute.*

Regular Meetings

The Papers and Meetings Committee consisted of J. A. Burnett, A.M.E.I.C., Chairman, and V. I. Smart, M.E.I.C., Vice-Chairman, 1920-21, and John T. Farmer,

M.E.I.C., Chairman, and H. W. Fairlie, A.M.E.I.C., Vice-Chairman for the six months ending December 31st 1921, together with the Chairmen and Vice-Chairmen of the various Branch Sections.

These two Committees have done excellent work in arranging the programme of papers which were presented every Thursday evening, January to April inclusive, and October to December inclusive. These papers covered various phases of engineering work in which the Branch is interested, many being of a highly technical nature, others of more general interest. In addition there were a number of addresses or exhibitions of moving pictures on subjects not directly connected with engineering work. The following table gives a complete list of the regular meetings of the Montreal Branch during the year 1921, with their authors and the attendance:—

conferred upon them by McGill University. This function will long be remembered by those who were fortunate enough to be able to attend.

On October 27th, there took place the inauguration of the Marine Section of the Branch. This event is looked upon as being one of more than passing importance as the formation of the Marine Section will undoubtedly lead to a number of engineers more particularly interested in marine work becoming members of *The Institute.*

On November 17th, the papers on Modern Railway Signalling were presented at the inauguration of the Railway Section of the Branch, which marks the revival of the interest of local railway engineers in *The Institute.*

Another meeting of unusual importance was that on November 24th, when the evening was devoted to Literature instead of Engineering.

Date		*Subject*	*Author*	*Attendance*
Jan.	6	*The Modern Newspaper	Chas. F. Crandall	100
"	13	Fire Prevention; The Engineer's Part	G. H. Greenfield	63
"	20	Bituminous Sands of Alberta	S. C. Ells, A.M.E.I.C.	65

"	10	Pulverized Fuel and its Uses	H. G. Barnhurst	130
"	17	*Modern Railway Signalling	C. H. Tillett & C. W. Parker	179
"	24	Some Canadian Writers I Have Met	Col. Geo. Ham	118
Dec.	1	The Montreal Aqueduct—Engineering Features	F. Y. Dorrance, A.M.E.I.C.	127
"	8	The Einstein Theory of Relativity	Professor L. T. Rutledge, M.E.I.C.	240
"	15	Annual Meeting		

*Motion pictures were also shown at these meetings.

Efforts were made during the summer months to arrange for a visit to the Montreal Harbour, but after negotiations had been carried on for some time it was found impossible to conclude the arrangements.

The second half of the period opened on October 6th, with a visit over the Montreal Aqueduct works during the afternoon in which a large number of members of the Branch took part.

Another outstanding event was the luncheon held on October 13th in honour of the six members of *The Institute* who were having the honorary degree of Doctor of Laws

A glance at the attendance figures given in the foregoing table shows that the members of the Branch are taking a keen interest in the meetings. The additional seating accommodation that has been provided in the Hall has already frequently been taxed to its capacity. It is gratifying to know that steps are being taken to improve the ventilation and also to further possibly increase the capacity of the Hall. In the past a number of members have refrained from attending meetings, not only on account of the lack of seating accommodation, but also on account of the lack of proper ventilation.

Publicity

While it has been found impossible to obtain very much publicity for the Branch in the Montreal "Star", the "Gazette" has given the Branch fair recognition, and has usually devoted a fair amount of space to our meetings and discussions. The Star, however, on one occasion, in an article referring to the necessity for the education of Canadian Marine engineers referred to the Montreal Branch of *The Engineering Institute* as having formed a Marine Section and quoting remarks made at the meeting.

Financial Statement

The Financial Statement for the year 1921 follows:—

Revenue

Cash in Bank — January 1st, 1921	$45.08
Rebates — October, November and December	134.25

	$ 140.00

Respectfully submitted

J. H. HUNTER,
Chairman.

J. L. BUSFIELD,
Secretary-Treasurer.

Quebec Branch

The President and Council,

On behalf of the Executive Committee, we beg to submit the annual report of the Quebec Branch for 1921.

During the past year, 5 general meetings and 8 Executive meetings were held.

Our Legislation Committee did splendid work and, more especially, when a certain bill was introduced to the last session of the Quebec Legislature, it largely contributed in having withdrawn from that bill all that could have affected the rights or prerogatives of the engineers.

We deeply regret the death of J. Emile Girard, A.M.E.I.C., director of surveys for the Department of Lands and Forests for the Province of Quebec. He was highly esteemed by his fellow-engineers and his memory will be piously remembered by the members of this Branch.

At the end of this year, our Branch numbers 14 members, 60 associate-members, 7 juniors, 8 students and 1 associate or a total membership of 90.

Despite the present crisis or economic stringency which is felt all over this country, the position of engineers in our locality may be considered as satisfactory.

Our treasurer's books, on December 27th, 1921, indicate a surplus of $377.82.

Respectfully submitted,

A. R. DECARY,
Chairman.

HECTOR CIMON,
Secretary-Treasurer.

Au Président et au Conseil,

Il nous fait plaisir de vous soumettre, ci-après, le rapport annuel de la Section de Québec pour 1921.

Au cours de l'année dernière, 5 assemblées générales et 8 réunions du conseil furent tenues.

Notre comité de législation a fait bon travail et, plus spécialement, dans le cas d'un bill présenté à la dernière Législature de Québec, il a concouru largement à en faire éliminer tout ce qui pouvait porter atteinte aux droits et prérogatives des ingénieurs.

C' est avec un profond regret que nous soulignons ici, la mort de J. Emile Girard, A.M.E.I.C., directeur des arpentages au Ministère des Terres et Forêts de la province de Québec. Il était hautement estimé de ses confrères et son souvenir sera pieusement conservé par les membres de notre Section.

A la fin de cette année, notre Section compte 14 membres, 60 membres associés, 7 juniors, 8 étudiants et 1 associé, soit un total de 90.

Malgré la crise ou malaise économique que traverse notre pays en ce moment, la situation des ingénieurs de notre région peut être considérée comme satisfaisante

Les livres de notre trésorier accusent, au 27 décembre 1921, un surplus de $377.82.

Respectueusement soumis,

A. R. DECARY,
Président.

HECTOR CIMON,
Secrétaire.

St. John Branch

The President and Council,

On behalf of the Executive Committee of the St. John Branch we beg to submit its fourth annual report, covering the year ending Dec. 31st. 1921.

Meetings

The Executive has met seven times during the year at which meetings general business has been transacted. The Branch held eight regular meetings when interesting papers were read and discussed. In addition, three special dinner meetings were held, an aircraft exhibit was shown and four excursions were made to works of interest in the vicinity of St. John, at two of which the members were the guests of the contractors at luncheon. The members have shown an increased interest in the affairs of the Branch and the meetings are well attended.

The various committees have been actively at work. The Branch has continued its interest in public affairs.

Membership

The membership at the end of the year is as follows:—

Grade	Resident	Non resident	Total
Member	14	3	17
Associate Member	27	5	32
Juniors	10	0	10
Associates	1	0	1
Students	2	0	2
Affiliates	9	1	10

Total end of year 1921	72
" " " " 1920	74
Net loss	2

Statement of receipts and expenditures for the year ending Dec. 31st, 1921.

Financial Statement

Revenue

Balance from 1920	$122.55
Rebate on dues from Headquarters	100.00

FRANK P. VAUGHAN,
Chairman.

HARRY F. BENNETT,
Secretary-Treasurer.

Moncton Branch

The President and Council,

On behalf of the Executive Committee we beg to submit the second annual report of the Moncton Branch.

The Executive Committee held eight meetings during the year 1921. These were twelve meetings of the Branch held at which interesting addresses were given, or papers read.

The membership has increased from thirty-three to fifty-nine during the year, a net gain of twenty-six. We have at present:—

Members	10
Associate Members	32
Juniors	11
Students	4
Affiliates	2
Total	59

We have held two meetings a month during the season, one of which was our popular Supper Meeting, at which the large number present showed great interest in the progress of the Branch and the welfare of *The Institute*.

The Annual Meeting of the Branch was held on May 5th, and after reports were read the following Officers were declared elected for 1921-22:—

Chairman, J. D. McBeath, M.E.I.C.,
Vice-Chairman, S. B. Wass, M.E.I.C.,
Secretary-Treasurer, M. J. Murphy, A.M.E.I.C.

Executive Committee:

A. F. Stewart, M.E.I.C., F. B. Fripp, A.M.E.I.C., F. O. Condon, A.M.E.I.C., Reid McManus, A.M.E.I.C., R. G. Gage, A.M.E.I.C., and H. J. Crudge, A.M.E.C.I.

Financial Statement

The financial statement for the year ending December 31st, 1921, is as follows:—

Revenue

Balance from 1920	$46.60
Rebates on dues and Branch News	160.29
Surplus from Suppers	19.55
Branch Affiliate Fees	6.00
Bank Interest	.52
	$232.96
Rebate due from Headquarters	7.54

Incidental Expenses	5.40
Total	$94.66
Balance including Rebates due from Headquarters	$145.84

Respectfully submitted,

J. D. McBEATH,
Chairman.

M. J. MURPHY,
Secretary-Treasurer.

Cape Breton Branch

The President and Council,

On behalf of the Executive Committee we beg to submit the Annual Report of the Cape Breton Branch. This Branch was authorized early in 1921, the following therefore, covers the first year of its existence.

Membership

At the date of authorization of the Branch there were seventeen members of all grades resident within the Branch radius, the petition to Council carrying twelve signatures. During the year twenty-nine applications have been received, of which eighteen have been elected. three classified for examination, and eight are pending.

A detailed comparison is as follows:—

	Members	Assoc. Members	Juniors	Students	Total
At Jan. 1921	5	8	3	1	17
Gained by transfer to this district.	–	5	2	1	8
Lost by transfer from this district...	1	2			3
Elected during 1921...	3	13	2		18
Members in good standing Dec. 31, 1921	7	24	7	2	40

Net gain during year..........................23

Meetings

The period from the commencement of the Branch to the annual meeting in May was largely taken up with organization and efforts to promote local interest in *The Institute* among those qualified for membership. Some measure of success in this was obtained, and is indicated by the increase in membership. It is hoped that further efforts by the local members will result in all engineers in our Branch radius realizing the advantages of membership to themselves and to the profession.

A successful meeting was held in May, Fraser S. Keith, the General Secretary making a special trip to Sydney, and his address on Institute affairs and objects was largely responsible for the subsequent activity and increase in membership. Two regular monthly meetings have been held this fall, one devoted to business and one to a professional paper by W. S. Wilson, A.M.E.I.C.

The Executive Committee have held in all, eleven meetings, which were chiefly taken up with matters of organization and the consideration of applications.

Regular meetings have been arranged for the coming months and there are good prospects of a successful season.

The Branch is fortunate in being allied with the Mining Society of Nova Scotia, the headquarters of which are in Sydney. Several members of the Mining Society are members of *The Institute*, and through their interest and courtesy arrangements have been made whereby, for a relatively small rental, the Branch members have the full use of the reading rooms and library of the Mining Society, situated in the Bank of Commerce building, Sydney. This library is probably the most complete reference on mining subjects in the Maritime Provinces, and the rooms are also suitable for our regular monthly meetings. To meet that portion of the rental of these rooms with which we are assessed, the Branch members have agreed to a local quarterly subscription of two dollars.

Halifax Branch

The President and Council,

On behalf of the Executive Committee, we beg to submit the following report. As the Branch year begins in May, this report covers part of two Branch years, with the activities controlled by two separate Executive Committees.

Meetings

During the year, nine meetings were held as folllows:—

Jan. 28—**"The Formation of Ice, and Its Prevention,"** John Murphy, M.E.I.C., of Ottawa, illustrated by moving pictures and lantern slides.

Feb. 23—**"Paints and their Uses,"** J. F. Ryan, Eastern representative of the Sherwin-Williams Paint Company; Number present, 25.

Mar. 24—**"Reinforced Concrete Fishery Piers at St. Pierre-Miquelon,** A. C. Brown, A.M.E.I.C.; Number present, 25.

April 28—"**Engineering Features of Automatic Telephone Equipment,**" A. J. Barnes of the Maritime Telegraph and Telephone Company, illustrated by lantern slides and a miniature exchange.

May 5—"**Reinforced Concrete Pipe for Water Supply,**" W. G. Chase, M.E.I.C., of St. John; Number present, 23.

May 17—**Annual Meeting**, at which the following Officers were elected:—

Chairman	C. E. W. Dodwell, M.E.I.C.
Secretary-Treasurer	O. S. Cox, A.M.E.I.C.
Executive	H. W. L. Doane, A.M.E.I.C.
	F. R. Faulkner, M.E.I.C.
	J. B. Hayes, A.M.E.I.C.
	W. P. Morrison, M.E.I.C.
	K. H. Smith, M.E.I.C.
	L. H. Wheaton, A.M.E.I.C.
(Ex. Officio)	F. A. Bowman, M.E.I.C.

Oct. 20—"**A Trip to Europe with Special Reference to Reconstruction in France after the War,**" Prof. F. H. Sexton; Number present, 46.

Nov. 18—"**General Tramway Engineering,**" I. P. McNab, M.E.I.C.; Number present, 42.

Dec. 9—"**Town Planning,**" H. W. Johnson, asst. city engineer; Number present, 42.

Membership

The membership of the Branch at the end of the year is as follows:—

Members	25
Associate Members	45
Juniors	15
Students	10
Branch Affiliates	5
Total	100

It will be noticed from these figures that while our membership has decreased slightly, the attendance at our meetings has greatly increased, indicating a keener interest in Branch meetings.

Financial Statement

Balance January 1st, 1921		$ 169.65
Revenue		
Headquarters rebates on dues and Branch News	$ 210.77	
Dues from Branch Affiliates	17.00

Balance Jan. 1st, 1922		$ 238.82

Respectfully submitted,

C. E. W. DODWELL,
Chairman.

O. S. COX,
Secretary-Treasurer.

Ottawa Branch

The President and Council,

On behalf of the Managing Committee of the Ottawa Branch, we beg to submit the following report for the calendar year 1921:—

Several questions of importance affecting the Branch as a whole have arisen during the year, particularly the Bill introduced in the Ontario Legislature. "An Act respecting Professional Engineers" and the Act which was passed by the Dominion Parliament "An Act to amend the Civil Service Act 1918" better known as the Spinney Bill.

The interests of the Branch in connection with the Professional Engineers' Act were looked after first by J. B. Challies, M.E.I.C., and later by A. B. Lambe, A.M.E.I.C., and their untiring efforts to promote the Bill deserve our united thanks. As matters stand at present, this Bill has been introduced, referred to a Parliamentary Committee and is still in the hands of that Committee.

The Spinney Bill contemplated the cancellation of the recent re-classification of Professional Civil Servants and the attitude of *The Institute* towards the Bill is expressed in the following resolution:—

"That *The Engineering Institute of Canada* strongly approved the provisions of the Civil Service Act of Nineteen Eighteen so far as they affected engineers and endorsed the system of making appointments and promotions in the public service by merit and efficiency; that they endorsed without reservation the principles on which the classification of the engineering positions in the federal service was based, as approved in Nineteen Nineteen and appointed a Committee to confer with and assist the Civil Service Commission in their work; that they place themselves on record as opposing and viewing with apprehension any alteration in the Civil Service Act by which appointments, promotions or matters of compensation are placed on any basis but merit, experience and

efficiency and firmly believe that any change of this nature would prejudice the opportunities offered capable men for a career in the service of the Government and would injuriously affect the obtaining of a high standard in the personnel and work of its various departments which can only be secured when merit and merit alone is recognized."

Another question of importance was the "Research Institute Bill" which was introduced last session. As a few members of the Branch considered that this Bill affected them vitally, an interview was arranged with the Research Council and the matter thoroughly discussed. As a result of this, matters were crystallized, the Professional Civil Servants interested met together and took concerted action through their representative body the "Professional Institute of Civil Servants".

Harmonious relations of the closest character have a all times been maintained between the Branch and the "Professional Institute" mentioned above and last year we were honoured in having K. M. Cameron, A.M.E.I.C., a member of the Managing Committee of the Ottawa Branch, as President of the "Professional Institute".

The "Engineers' Ball" under the distinguished patronage of their Excellencies the Governor-General and the Duchess of Devonshire, at the Chateau Laurier, on the 26th January was a success financially and otherwise and it is hoped that this feature will be established as an annual affair.

The "Annual Popular Lecture" was given by Col. Stedman, chief technical officer of the Air Board, and was in every way a credit to the Branch. This feature has proven to be a success and it is the opinion that it is a valuable feature from a publicity standpoint and should be continued.

The three outstanding papers of the year have been presented by members of the Branch viz.: Col. Stedman, Commander Phillips and Mr. Peters and it is hoped that other local members will come forward with papers from time to time.

We are pleased to report that the new Governor-General, His Excellency Lord Byng of Vimy, has accepted Honorary membership in *The Engineering Institute* and has extended his patronage to the second "Annual Ball" which is to be held on the 26th January, 1922.

During the year the Managing Committee held 13 meetings. In addition the Branch had 12 evening meetings and 4 luncheons. The policy has been continued of paying 25% of the cost of the luncheons out of Branch funds.

On the 8th December, J. M. R. Fairbairn, D.Sc., M.E.I.C., President of *The Institute* visited us at a regular luncheon and gave a very interesting address on *The Institute* and its Branches.

Meetings

During the year the following meetings of the Branch were held:—

Jan. 5—**Open meeting for all interested in the proposed Provincial Act respecting Professional Engineers;** at the City Hall.

Jan. 15—**Annual meeting,** University Club.

Jan. 18—**Meeting to discuss proposed Provincial Act respecting Professional Engineers;** at the University Club.

Jan. 26—**Ball,** under the distinguished patronage of their Excellencies the Governor General and the Duchess of Devonshire; at the Chateau Laurier.

Feb. 10—**"Cement and Super-Cement,"** E. Viens and Capt. E. M. Dawson, M.C.E.;Joint meeting with the Society of Chemical Industry, at the Carnegie Library.

Feb. 17—**"Review of Mechanical Ship Propulsion,"** Engineer-Commander T. C. Phillips, M.E.I.C., A.M.I.N.A., M.I.Mech.E., chief engineer Canadian Naval Service; at Victoria Memorial Museum.

Mar. 3—**"Industrial Relations,"** address by Hon. Senator G. D. Robertson, Minister of Labour, at Luncheon at Chateau Laurier.

Mar. 17—**"The Aeroplane and its Development."** The Annual Popular lecture given under the auspices of the Branch by E. W. Stedman, A.R.C.S., A.F.R.A.S., A.M.I.C.E., chief technical officer, the Air Board, Ottawa; evening meeting at the Victoria Memorial Museum.

April 7—**"The Manufacture of Armco Ingot Iron and Specialty Steel Sheets,"** W. T. Jenkins, A.M., A.S.M.E.; evening lecture at Victoria Memorial Museum.

April 14—**"The Proposed Research Institute for Canada,"** address by Hume Cronyn, M.P., Luncheon meeting at Chateau Laurier.

April 21—**"Irrigation in Western Canada,"** lecture by F. H. Peters, M.E.I.C.; in Victoria Memorial Museum.

Oct. 13—**"Forests and the Fire Hazard,"** address by Ellwood Wilson, Manager, Forestry Dept., Laurentide Company, Grand Mere, P. Q.; at luncheon at Chateau Laurier.

Oct. 20—**"Petroleum and its Products,"** evening lecture by C. I. Grierson, B.A.Sc., technical engineer, Imperial Oil Limited, Toronto; at the Victoria Memorial Museum.

Nov. 15—**"The Story of Rock Drilling,"** P. Sherrin, A.M.E.I.C.; evening lecture at Victoria Memorial Museum.

Nov. 24—**"Complex Nature of a Modern Telephone System;"** evening lecture at Victoria Memorial Museum, by N. M. Lash, B.Sc., chief engineer, Bell Telephone Company of Canada, Montreal.

Dec. 8—**The President's visit to the Branch;** J. M. R. Fairbairn, President of **The Engineering Institute of Canada** was the very welcome guest of the Branch at a luncheon at the Chateau Laurier.

Dec. 15—**Evening Entertainment at the Chateau Laurier.**

In the lectures and addresses the Committee has followed the advice given in the report of the Committee on Policy, adopted at the last Annual Meeting, in enhancing the interest of the public towards the profession and in publicity, especially through local mediums. The evening lectures have generally been of a popular, educational nature, and the attendance, averaging 400, would appear to substantiate the course followed. At the monthly luncheons the attendance has averaged 80, and a sustained interest has been shown.

Through the courtesy of the local newspapers, advance notices and comprehensive reports of meetings have been given. During the year the local press has carried an

aggregate of 37 columns, of 22 inches each, of reports and notices of meetings and in addition editorials have appeared.

Continuing the policy of the Branch to invite to its meetings and luncheons, prominent men interested in the subjects to be presented, we have had the honour of meeting Hon. Senator Robertson, Minister of Labour; Tom Moore, President, The Trades and Labour Congress of Canada; Major-General Sir Willoughby Gwatkin; Hon. H. H. Stevens, M.P.; Dr. A. Thompson, M.P.; Hon. F. B. Carvell, Chairman, Board of Railway Commissioners; Dr. J. G. Rutherford, Board of Railway Commissioners; J. B. Hunter, Deputy Minister, Dept. of Public Works; Charles Camsell, Deputy Minister of Mines; E. Brydone-Jack, M.E.I.C., Victoria, B.C.; Willis Chipman, M.E.I.C., Toronto; H. B. R. Craig, M.E.I.C., London; and many others.

Membership

During the year the Committee on Membership held eight meetings and dealt with 55 applications as follows:—

New Members	1
Transfer from lower grade to full membership	4
Associate Members	27
Transfers from lower grade to Associate Members	5
Juniors	6
Transfer from Student	3
Associates	3
Branch Affiliates	1
Referred to Montreal	2
Deferred	2
Refused	1
	55

The following table shows the comparative figures of the Branch membership for the year 1919, 1920 and 1921:—

	1919	*1920*	*1921*
Honorary Members	1	1	1
Members	81	90	89
Associate Members	148	158	167
Associates	2	2	2
Juniors	31	32	35
Students	28	27	24
Branch Affiliates	24	24	19
	315	334	337

Rooms and Library

The question of permanent quarters for the Branch has been discussed at previous Annual meetings and the general feeling has been that the matter should be held in abeyance until some specially favoured opportunity presents itself. Accordingly no active steps have been taken in this direction during the past year except to keep it in view and investigate and report on such possibilities as were brought to the attention of the Committee. Part of the furniture owned by the Branch has been loaned to the Minto Skating Club and it is hoped to dispose of it on favourable terms. The remainder of the furniture is still stored in an unoccupied office.

The Branch Library is now located on the third floor of the Journal Building and has been more extensively used by the members during the past year than previously.

The library is in correspondence with the Library of Congress at Washington, receives all the bulletins issued by it and make use of the cards printed by it for cataloguing purposes. The library is also a member of the Library Association of Ottawa which comprises some fifty separate units. Arrangements are being made with the latter for the exchange of information and for mutual assistance in a number of ways which cannot fail to be a great help to all users of these libraries. One important step has already been taken by compiling a list of all technical and scientific periodicals received by those various libraries which will fill a long-felt want.

This work is in line with the desire to be able to direct inquirers to the proper sources of information where any special request in regard to engineering research is made. It is impossible with the space and money available, for the Branch library to cover even in a very general way the whole field of engineering literature; but it is possible to maintain a reference library which may yield valuable results and this aim is now being realized to a considerable extent.

Colonel Macpherson very kindly presented to the Branch bound volumes of the Proceedings of the Institution of Civil Engineers from the year 1912 to date, thus completing the set which the Branch received some years ago from the late Sir John Kennedy. This series of proceedings with its indexes and abstracts gives a fairly complete history of engineering progress in all its branches throughout the world from the year 1837. Accessions to the library have also been received from Col. Monsarrat, K. M. Cameron, C. D. Norton and the main Institute.

Remuneration

The work of the Committee on Remuneration is to assist in solving the problem of improving the financial status of the engineer and increasing the amount of his remuneration to a level more in keeping with the conditions obtained in other professions and in the business world. A considerable amount of work has been done by many Committees of this character in the classification of positions and the preparation of salary schedules. These schedules will be of great value at the proper time and in the proper place, but it is felt that such things belong to the final rather than the initial stages of the work. The time of the Committee has therefore been spent in examining into and analyzing the conditions and underlying causes which have resulted in the present unsatisfactory state of affairs, with the object of attacking the evil at its root and working up. The result of these deliberations was embodied in a preliminary report which was forwarded to the General Secretary.

Policy

In 1920 the Committee on Policy prepared a very comprehensive report which was submitted to the General Committee of *The Institute.* In this report, taking Section 1 of the By-laws as a starting point, an analysis was given of the most important lines to be followed in promoting its aims.

During the past year the Committee has followed the progress of *The Institute* as affecting the trend of its future development and from time to time has been consulted by the Managing Committee of the Branch in regard to specific matters which have arisen.

Finances

The financial position of the Branch still continues to be highly satisfactory as may be seen by reference to the attached statements of assets and liabilities and receipts and expenditures.

The Branch closes the year with a balance of $614.12 in the bank; $3.66 in cash on hand, and $800.00 in Victory Bonds, a total balance of $1417.78. In 1910 the Branch had a deficit of $175.00, which continued until 1916 when there was a credit balance of about $200.00 which has steadily increased until we now have over $1400.00.

JOHN G. SULLIVAN, M.E.I.C.
PRESIDENT
The Engineering Institute of Canada.

John G. Sullivan, M.E.I.C., President of **The Engineering Institute of Canada** for the year nineteen hundred and twenty-two brings to the office the experience of thirty-four years spent in the West, combined with that spirit of optimism and enthusiasm which characterizes the men of the Western provinces.

Mr. Sullivan was born at Bushnells Basin, New York State, on the eleventh day of January, eighteen hundred and sixty-three, and at the age of twenty-five graduated from Cornell University with the degree of C.E. In July of his graduating year, he became associated with railway development in the West, with which he has remained continuously, in many and varied capacities, from that time until the present. Although graduate, he started, as many another good man has done, by working his way up from a rodman, which position he occupied from July eighteen hundred and eighty-eight to April eighteen hundred and eighty-nine on the Great Northern Railway in Montana, Dakota and Minnesota. A year later he was with the Spokane Falls and Northern Railway, occupying positions as rodman, pile inspector, leveller, instrumentman, and finally, as assistant engineer in charge of work. From August eighteen hundred and ninety until February eighteen hundred and ninety-two, he was associated with the Great Northern Railway System in charge of work as assistant engineer on the Seattle and Montana Railway and the following year was in charge of work on the Pacific Extension of the Great Northern Railway. July, eighteen hundred and ninety-three, finds Mr. Sullivan as assistant engineer in charge of work with the Alberta Railway and Coal Company, and the following year as locating engineer with the Butte Anaconda and Pacific Railway Company.

JOHN G. SULLIVAN, M.E.I.C.
President
The Engineering Institute of Canada.

The year eighteen hundred and ninety-five was an important one in Mr. Sullivan's career, as it was then that he came to Canada as locating and division engineer with the Kaslo and Slocan Railway Company, British Columbia. For the next four years he occupied various positions with the Columbia and Western Railway Company, first as reconnaisance engineer and later as principal assistant engineer in charge of all construction and surveys, during which time he was responsible for over one hundred miles of railroad construction, and made surveys for two hundred miles of location for proposed roads. It was on the work of the Pacific Extension of the Great Northern Railway Company that he received his first experience in tunnelling, having been responsible for the construction of two, each fifteen hundred feet long.

In August nineteen hundred, Mr. Sullivan joined the Canadian Pacific Railway as divisional engineer of construction, and with the exception of a year and a half as assistant chief engineer of the Panama Canal, his association with the Canadian Pacific Railway has been continuous up to the present time. In February, nineteen hundred and seven, Mr. Sullivan was made manager of construction of Eastern Lines, and a year and a half later was appointed assistant chief engineer. In nineteen hundred and eleven, his title and responsibility became that of chief engineer of Western Lines, and he occupied the position of chief engineer from nineteen hundred and fifteen to July, nineteen hundred and eighteen, since which time he has been retained with the Company as consulting engineer.

His previous association as an officer of **The Institute**, includes Councillor on two different occasions, and vice-president during the years nineteen hundred and eleven, twelve and thirteen. Mr. Sullivan became a member of **The Institute** in nineteen hundred, having been elected a member of the American Society of Civil Engineers the year before. In nineteen hundred and eighteen he was president of the American Railway Engineering Association. He is a member of the Manitoba and St. Charles Country Clubs, Winnipeg, St. James Club, Montreal, and Cornell University Club, New York.

Mr. Sullivan married Sarah Farrell, daughter of Thomas Farrell, Lodi, N.Y., in eighteen hundred and ninety-five, the family consisting of two sons and two daughters.

Besides enjoying a lucrative consulting engineering practice, President Sullivan has found time for public spirited activities. In nineteen hundred and twenty he was elected alderman for the city of Winnipeg for two years, and at the recent municipal election was re-elected for the term of nineteen hundred and twenty-two and nineteen hundred and twenty-three.

As Chairman of the Manitoba Drainage Commission, which position he has occupied since March nineteen hundred and nineteen, he is an authority on the subject of drainage, and for many years has been known as one of the best authorities in America on the economics of railway location.

A genial personality, true Irish wit, and natural ability of a high order are outstanding characteristics that may be considered as factors in advancing the subject of this sketch to the high position he occupies in the engineering world.

THE
ENGINEERING JOURNAL

THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOL. V. February 1922 No. 2

Greetings from American Federation of Engineering Societies.

At the commencement of the first session of the Annual General Meeting, a telegram was read by President Fairbairn which was received with great applause, from Dr. M. E. Cooley, President of the American Federation of Engineering Societies. Dr. Cooley is a past-president of the American Society of Mechanical Engineers, and Dean of the Colleges of Engineering and Architecture of the University of Michigan, Ann Arbor, Michigan.

The message reads:—
Fraser S. Keith,
Engineering Institute of Canada,
176 Mansfield Street,
Montreal, Que.

Please convey my greetings to *The Engineering Institute* assembled in Annual Convention, and say to our Canadian brother engineers that the hope was expressed at the Annual Meeting of American Engineering Council in Washington the sixth instant, that *The Engineering Institute* would before long join the American Federation of Engineering Societies. Such membership would go far towards the establishment of a Federation of Engineers of the world which if accomplished could be made a great force in the intelligent discussion and settlement of world problems. It is time that the engineering profession was heard.

M. E. COOLEY, *President*,
American Federation of
Engineering Societies.

The proposal contained in Dr. Cooley's message was left to the Council of *The Institute* for consideration and action.

Policy Committee Meeting.

An important decision was reached at the meeting of Council held at headquarters on January twenty-fifth, in connection with the affairs of *The Institute* when it was resolved that a meeting of the Committee on Policy be held in Montreal, at a date to be chosen by the chairman of the committee, J. B. Challies, M.E.I.C. The committee was authorized to spend not more than twelve hundred dollars as a total expense of the meeting.

As there are so many important suggestions regarding the affairs of *The Institute*, many of them having been under discussion for about two years it was felt by Council that such an important committee could not accomplish the best results by correspondence, and only by a meeting such as the one to be convened would the final report of the committee be possible.

Badge of The Institute

Although a photograph of the official badge of *The Institute* was published previously, it is reproduced here for the benefit of those who have joined *The Institute* more recently. This badge is available either as a lapel button, a pin or a watch fob. The badge for Members is gold, price three dollars and seventy-five cents, for Associate Members silver, price two dollars and twenty-five cents and bronze for Juniors and Students, price one dollar and fifty cents. The owner's name is engraved on the back together with the number of his badge.

These are available through the Secretary's office.

The Thirty-Sixth Annual Meeting

The Annual General Meeting of *The Institute*, was held at headquarters, on Tuesday, January twenty-fourth. President Fairbairn, D.Sc., M.E.I.C., opened the meeting at ten thirty A.M.

Reading of Minutes.

It was moved by C. A. Mullen, M.E.I.C., seconded by K. M. Cameron, M.E.I.C., and carried, that the minutes of the last annual meeting be taken as read. Motion carried.

Appointment of Scrutineers.

It was moved by John Farmer, M.E.I.C., seconded by J. B. Challies, M.E.I.C., that W. S. Lea, M.E.I.C., and G. K. McDougall, M.E.I.C., be appointed scrutineers to report the result of the officers' ballot to the Secretary. Motion carried.

Appointment of Auditors.

It was moved by H. G. Acres, M.E.I.C., seconded by Sir Alex Bertram, M.E.I.C., that Messrs. Riddell, Stead, Graham and Hutchison, be appointed auditors for the ensuing year. Motion carried.

Report of Council.

It was moved by Geo. Mountain, M.E.I.C., seconded by Geo. T. Clark, A.M.E.I.C., that the report of Council, as published on page fifty-one of the February *Journal* be adopted. Motion carried.

Reports of Committees.

Finance Committee: — The report of the Finance Committee being read by the chairman, R. A. Ross, M.E.I.C., published in the February *Journal*, page fifty-five, it was moved by H. R. Safford, M.E.I.C., seconded by C. K. McLeod, A.M.E.I.C., that the report of the Finance Committee be adopted. Motion carried.

Library and House Committee: — It was moved by the chairman, Sir Alex. Bertram, M.E.I.C., seconded by H. R. Safford, M.E.I.C., that the report of the Library and House Committee, as published on page fifty-four of the February *Journal*, be taken as read. Motion carried.

Legislation and By-laws Committee: — It was moved by J. E. Gibault, A.M.E.I.C., seconded by S. Blumenthal, A.M.E.I.C., that the report of the Legislation and By-laws Committee, as published on page fifty-five of the February *Journal*, be adopted. Motion carried.

Papers Committee: — It was moved by John Farmer, M.E.I.C., seconded by W. D. Lawrence, A.M.E.I.C., that the report of the Papers Committee, as published on page fifty-five of the February *Journal*, be adopted. Motion carried.

Publications Committee: — The report of the Publications Committee was read by the Secretary, in the absence of the chairman, H. H. Vaughan, M.E.I.C., as follows:— The Publication Committee beg to submit the following report for the year 1921, covering papers printed in *The Journal* from December 1920 to November 1921, both inclusive. It is recommended that the papers named below be printed in the Transactions; President's Address, R. A. Ross; Toronto Filtration Plant, Jas. Milne; On the Economics of Building Construction, J. Morrow Oxley; Relay Protective Features of the Toronto Transmission and Distribution System, P. Ackerman; A Logical Scheme for Determining the Concrete Making Value of Available Aggregates, G. M. Williams; Self-Corrosion of Cast Iron or Other Metals in Alkaline Soils, W. Nelson Smith and Dr. J. W. Shipley. Signed by Walter J. Francis, Col. R. W. Leonard, R. A. Ross, H. H. Vaughan. On motion by R. M. Hannaford, M.E.I.C., seconded by C. K. McLeod, A.M.E.I.C., the report was adopted.

Canadian Engineering Standards Committee: — It was moved by S. Blumenthal, A.M.E.I.C., seconded by John Murphy, M.E.I.C., that the report of the Canadian Engineering Standards Committee, as published on page fifty-eight of the February *Journal*, be adopted. Motion carried.

Canadian National Committee, International Electro-Technical Commission: — It was moved by J. A. Jamieson, M.E.I.C., seconded by C. K. McLeod, A.M.E.I.C., that the report of the Canadian National Committee of the International Electro-Technical Commission, as printed on page fifty-nine of the February *Journal*, be adopted. Motion carried.

Civil Service Classification Committee: — It was moved by C. K. McLeod, A.M.E.I.C., seconded by H. R. Safford, M.E.I.C., that the report of the Civil Service Classification Committee as published on page fifty-nine of the February *Journal*, be adopted. Motion carried.

Committee on Deterioration of Concrete in Alkali Soils: — It was moved by W. D. Lawrence, A.M.E.I.C., seconded by E. V. Moore, M.E.I.C., that the report of the Committee on Deterioration of Concrete in Alkali Soils, as printed on page fifty-nine of the February *Journal*, be adopted. Motion carried.

Honour Roll and War Trophies Committee: — On motion of General Armstrong, M.E.I.C., seconded by J. H. Hunter, A.M.E.I.C., the report of the Honour Roll and War Trophies Committee as published on page sixty of the February *Journal* was adopted.

International Co-operation Committee: — It was moved by John Murphy, M.E.I.C., seconded by John Farmer, M.E.I.C., that the report of the International Co-operation Committee, as published on page sixty-one of the February *Journal*, be adopted. Motion carried.

Publicity Committee: — On motion of the chairman, Frederick B. Brown, M.E.I.C., seconded by Commander Edwards, the report of the Publicity Committee, as published on page sixty-one of the February *Journal*, whas adopted.

Roads and Pavements Committee: — It was moved by Geo. Mountain, M.E.I.C., seconded by J. A. Duchastel, M.E.I.C., that the report of the Roads and Pavements Committee, as published on page sixty-two of the February *Journal*, be adopted. Motion carried.

Uniform Boiler Specifications Committee: — On motion of S. Blumenthal, A.M.E.I.C., seconded by E. W. Oliver, M.E.I.C., the report of the Uniform Steam Boiler Specifications Committee, as published on page sixty-three of the February *Journal*, was adopted.

Gzowski Medal Committee:—The report of the Gzowski Medal Committee, was read by the secretary, as follows:—Your Committee appointed to judge the papers eligible for this competition, presented to *The Institute* during the year ending June 1920, award this medal to Mr. P. Ackerman, A.M.E.I.C., for his paper on "Relay Protective Features of the Toronto Transmission and Distribution System". Signed by Walter J. Francis, Col. R. W. Leonard, R. A. Ross, H. H. Vaughan. On motion by O. O. Lefebvre, M.E.I.C., seconded by J. B. Challies, the report was adopted. This report also showed the Students' prizes awards as follows:—A. M. Robertson, S.E.I.C., for paper on "Organization of Engine Service during the War", and E. R. Woodward, Jr.E.I.C., for paper on "Lignite Briquetting Plant at Bienfait".

Leonard and Plummer Medal Committees:—It was moved by R. A. Ross, M.E.I.C., seconded by J. A. Jamieson, M.E.I.C., that the reports of the Leonard and Plummer Medal Committees, be received by Council. Motion carried.

The meeting adjourned until two thirty P.M.

In the afternoon session, the Chair was occupied by Vice-President H. G. Acres, M.E.I.C.

Reports of Branches.

Victoria Branch:—On motion of Rex. P. Johnson, A.M.E.I.C., seconded by J. B. Challies, M.E.I.C., the report of the Victoria Branch (February *Journal* page sixty-four) was adopted.

Vancouver Branch:—On motion by S. Blumenthal, A.M.E.I.C., seconded by Sir Alex. Bertram, M.E.I.C., the report of the Vancouver Branch (February *Journal* page sixty-five) was adopted.

Calgary Branch:—On motion by Geo. MacLeod, M.E.I.C., seconded by Col. Magwood, M.E.I.C., the report of the Calgary Branch (February *Journal* page sixty-six) was adopted.

Edmonton Branch:—On motion by J. H. Larmonth, M.E.I.C., seconded by R. L. Dobbin, M.E.I.C., the report of the Edmonton Branch (February *Journal* page sixty-eight) was adopted.

Lethbridge Branch:—On motion by A. C. D. Blanchard, M.E.I.C., seconded by B. E. Barnhill, M.E.I.C., the report of the Lethbridge Branch (February *Journal* page sixty-eight) was adopted.

Saskatchewan Branch:—On motion by J. Clark Keith, A.M.E.I.C., seconded by Capt. Duchastel, M.E.I.C., the report of the Saskatchewan Branch (February *Journal* page sixty-eight) was adopted.

Winnipeg Branch:—On motion by W. Chase Thomson, M.E.I.C., seconded by Major McKergow, M.E.I.C., the report of the Winnipeg Branch (February *Journal* page sixty-nine) was adopted.

Sault Ste. Marie Branch:—On motion by B. E. Barnhill, M.E.I.C., seconded by R. L. Dobbin, M.E.I.C., the report of the Sault Ste. Marie Branch (February *Journal* page seventy-two) was adopted.

Border Cities Branch:—On motion of J. Clark Keith, A.M.E.I.C., seconded by John Farmer, M.E.I.C., the report of the Boder Cities Branch (February *Journal* page seventy-three) was adopted.

London Branch:—On motion by Geo. C. Wright, A.M.E.I.C., seconded by J. W. H. Ford, A.M.E.I.C., the report of the London Branch (February *Journal* page seventy-four) was adopted.

Niagara Peninsula Branch:—On motion by Rex P. Johnson, A.M.E.I.C., seconded by A. C. D. Blanchard, M.E.I.C., the report of the Niagara Peninsula Branch (February *Journal* page seventy-four) was adopted.

Hamilton Branch:—On motion by R. M. Hannaford M.E.I.C., seconded by J. A. Burnett, A.M.E.I.C., the report of the Hamilton Branch (February *Journal* page seventy-five) was adopted.

THIRTY-SIXTH ANNUAL MEETING,

Toronto Branch: — On motion by Geo. T. Clark, A.M.E.I.C., seconded by F. B. Goedike, A.M.E.I.C., the report of the Toronto Branch (February *Journal* page seventy-six) was adopted.

Peterborough Branch: — On motion of R. L. Dobbin, M.E.I.C., seconded by Col. Magwood, M.E.I.C., the report of the Peterborough Branch (February *Journal* page seventy-six) was adopted.

Kingston Branch: — On motion by F. B. Goedike, A.M.E.I.C., seconded by Geo. C. Wright, A.M.E.I.C., the report of the Kingston Branch (February *Journal* page seventy-seven) was adopted.

Montreal Branch: — On motion by P. L. Pratley, M.E.I.C., seconded by Major McKergow, M.E.I.C., the report of the Montreal Branch (February *Journal* page seventy-eight) was adopted.

Quebec Branch: — On motion by J. E. Gibault, A.M.E.I.C., seconded by C. A. Buteau, A.M.E.I.C., the report of the Quebec Branch (February *Journal* page eighty) was adopted.

St. John Branch: — On motion by H. F. Bennett, A.M.E.I.C., seconded by C. C. Kirby, M.E.I.C., the report of the St. John Branch (February *Journal* page eighty-one) was adopted.

Moncton Branch: — On motion by C. C. Kirby, M.E.I.C., seconded by Rex P. Johnson, A.M.E.I.C., the report of the Moncton Branch (February *Journal* page eighty-one) was adopted.

Cape Breton Branch: — On motion by K. G. Cameron, A.M.E.I.C., seconded by K. H. Smith, M.E.I.C., the report of the Cape Breton Branch (February *Journal* page eighty-two) was adopted.

Halifax Branch: — On motion by O. S. Cox, A.M.E.I.C., seconded by K. H. Smith, M.E.I.C., the report of the Halifax Branch (February *Journal* page eighty-two) was adopted.

Ottawa Branch: — On motion by Commander C. P. Edwards, A.M.E.I.C., seconded by O. S. Finnie, M.E.I.C., the report of the Ottawa Branch (February *Journal* page eighty-three) was adopted.

Ontario Provincial Division: — On motion by Col. W. H. Magwood, M.E.I.C., seconded by A. B. Lambe, A.M.E.I.C., the report of the Ontario Provincial Division (February *Journal* page seventy) was adopted.

Report of the Nominating Committee: —The following comprises the Nominating Committee for the year 1922, being the nominees of the various Branches: — Ottawa and Kingston Branches, John Murphy, M.E.I.C.; Border Cities, H. Thorn, M.E.I.C.; Cape Breton, G. D. Macdougall, M.E.I.C.; St. John, C. McN. Steeves, M.E.I.C.; Saskatchewan, C. J. Mackenzie, M.E.I.C.; Vancouver, J. Muirhead, M.E.I.C.; Peterborough, P. L. Allison, M.E.I.C.; Hamilton, J. A. McFarlane, M.E.I.C.; Moncton, J. D. McBeath, M.E.I.C.; Calgary, F. W. Alexander M.E.I.C.; Niagara Peninsula, A. J. Grant, M.E.I.C.; Toronto, Wm. Storrie, M.E.I.C.; Winnipeg, J.G.Legrand, M.E.I.C.; Halifax, F. A. Bowman, M.E.I.C.; Edmonton, C. C. Sutherland, A.M.E.I.C.; Sault Ste. Marie, B. E. Barnhill, M.E.I.C.; Quebec, A. B. Normandin, A.M.E.I.C.; Lethbridge, G. N. Houston, M.E.I.C.; Montreal, O. O. Lefebvre, M.E.I.C., and P. B. Motley, M.E.I.C.; Victoria, K. M. Chadwick, A.M.E.I.C. On motion by Frederick B. Brown, M.E.I.C., seconded by Geo. T. Clark, A.M.E.I.C., the report was adopted.

Amendment to Section 52 of the By-laws.

Moved by Major McKergow, M.E.I.C., seconded by J. B. Challies, M. E.I.C., that this take the usual course, by sending out a ballot, accompanied by a pro and con circular. The chairman nominated A. B. Lambe, A.M.E.I.C., and J. L. Busfield, A.M.E.I.C., to prepare the circular, for and against the proposed amendment. The proposed wording of section fifty-two is:—

MONTREAL, JAN. 24th. 1922.

"Each Branch shall be managed by an Executive Committee or Managing Committee consisting of:

(A) A Branch chairman, a Branch Secretary-treasurer, and not less than three other members, all to be known as elected members and to be ballotted for by all members of the branch entitled to vote at branch elections.

(B) Those members of Council resident within the jurisdiction of the branch, to be known as ex-officio members, and

(C) The immediate past-chairman and the immediate past secretary-treasurer to be known as members emeritus, these latter to be members for only the year immediately following their term of office."

The membership was advised of the proposal as required in the by-laws by an announcement on page six hundred and seventeen of the December *Journal.*

Publicity.

The question of greater publicity for engineers was discussed, and a motion by Mr. Mullen, seconded by Mr. Blanchard that Council appoint a committee to go into the matter of publicity, taking up the matter with local Branches was carried.

Chemist for Concrete Deterioration in Alkali Soils.

It was moved by Mr. Vaughan, seconded by Mr. Hunter that the meeting approve of the action of the Committee on Deterioration of Concrete in Alkali Soils in securing the services of a chemist to carry on their work, on the understanding that it does not commit *The Institute* in case the Committee contracts to spend funds which it has not on hand. An amendment that the matter be referred to Council with power to act was lost, and on standing vote the original motion was carried.

Death of E. D. Lafleur, M.E.I.C.

On motion by K. M. Cameron, M.E.I.C., seconded by Geo. Mountain, M.E.I.C., that the meeting record the heartfelt sympathy of those present for the family of the late E.D. Lafleur, M.E.I.C., and that a message expressing the sympathy of *The Institute* be sent to the family.

Officers Elected.

The report of the scrutineers as read by the Secretary giving the result of the ballot showed that the following officers and members of Council had been elected:—

President.............J. G. Sullivan, M.E.I.C.
Vice-Presidents........C. H. Mitchell, M.E.I.C.,
Arthur Surveyer, M.E.I.C.

Councillors: — District No. 1, J. A. Duchastel, M.E.I.C., Geo. MacLeod, M.E.I.C.; District No. 2, J. E. Gibault, A.M.E.I.C.; District No. 3, A. F. Stewart, M.E.I.C.; District No. 4, Alexander Macphail, M.E.I.C., District No. 5, R. O. Wynne-Roberts, M.E.I.C.; District No. 6, C. H. E. Rounthwaite, A.M.E.I.C.; District No. 7, D. A. Ross, M.E.I.C.; District No. 8, A. R. Greig, M.E.I.C.; District No. 9, R. S. L. Wilson, A.M.E.I.C.; District No. 10, Geo. A. Walkem, M.E.I.C.

Vote of Thanks to Montreal Branch.

It was moved by H. R. Safford, M.E.I.C., seconded by Commander C. P. Edwards, A.M.E.I.C., that this meeting extend a hearty vote of thanks to the Montreal Branch.

The business of the meeting being concluded President J. M. R. Fairbairn, D.Sc., M.E.I.C., delivered his retiring presidential address.

Professional Meeting

In addition to the sessions on Tuesday, January 24th, at which the business of the annual meeting of *The Institute* was transacted there were two enjoyable social functions: a luncheon in the mezzanine dining-room, Windsor Station, at which over one hundred and fifty were present and at which the visiting Branch Secretaries were the guests of honour. The Annual Banquet was held in the Windsor Hotel, the chair was taken by H. G. Acres, M.E.I.C., newly elected Vice-President, and with him at the head table were the following: J. A. Duchastel, M.E.I.C., Geo. Mountain, M.E.I.C., H. R. Safford, M.E.I.C., Sir Alex. Bertram, M.E.I.C., G. Gordon Gale, M.E.I.C., Fraser S. Keith, M.E.I.C., Phelps Johnson, M.E.I.C., C. V. Corless, M.E.I.C., G. H. Duggan, M.E.I.C., Fred. B. Brown, M.E.I.C., J. B. Challies, M.E.I.C., R. A. Ross, M.E.I.C., J. M. R. Fairbairn, M.E.I.C. After the toast to The King, "*The Institute*" was proposed by George A. Mountain, M.E.I.C., and replied to by H. G. Acres, M.E.I.C., who in his speech mentioned his gratification at there being present no less than five past-presidents. The Banquet was followed by a most enjoyable smoking concert. The programme was excellent and reflects great credit on the organizers. *The Institute* was represented on the programme by Professor C. M. McKergow whose number "Thursday Evening at 8.15", a discussion on a technical subject in the manner of three well-known members of Montreal Branch was greeted with loud applause, and Yves Lamongne, Jr.E.I.C., who gave a 'cello selection in his usual finished manner. The other items on the programme also gave much enjoyment, and were enthusiastically received by the members present.

Social Functions

An annual function greatly enjoyed by those fortunate enough to be present, was the dinner given by the retiring President at the University Club on Wednesday evening to the outgoing and incoming Councils. It was a unique occasion in that at the head table there were seven past presidents of *The Institute* and three vice-presidents.

Following the business sessions held on Tuesday January 24th, a one-day Professional Meeting under the auspices of the Montreal Branch was held on Wednesday 25th.

The programme was opened by an excursion to the plant of the Dominion Engineering Works, Lachine, where the new 41,000 H.P. unit now being constructed for the Shawinigan Water and Power Company was inspected. The plant proved most interesting to the visitors, and in addition to the large turbines other machines in course

of erection were inspected. To construct these very large turbines the Dominion Engineering Works has installed the largest vertical boring mill on the continent.

Following the inspection of the Dominion Engineering Works a luncheon was held in the Prince of Wales Salon, Windsor Hotel. The chair was taken by J. A. Duchastel, M.E.I.C., who after proposing the toast to "The King" introduced Alderman Hushion, who, on behalf of the Mayor welcomed the members of *The Institute* for the city. Mr. Duchastel then introduced Prof. H. E. T. Haultain, who addressed the gathering on "The Romance of Engineering".

The subject introduced by an apparently savage attack on the admission of ladies to any of the functions of *The Engineering Institute,* Professor Haultain declared himself one of the chief fighters against this innovation. However, following the gains of the ladies, first at Ottawa, next at Niagara Falls, and Toronto, he had noticed that to date they had never been officially welcomed, and he now took that duty upon himself. He went on to say that there was a very real work which the wives of the members of *The Institute* could perform in developing the "tribal soul". After all, this was the prime purpose of all gatherings of *Institute* members, and where the ladies could help largely was in instilling the *Institute* spirit into the younger men as they came through and graduated from the universities.

Following the luncheon, the afternoon session was opened at headquarters when a most interesting address was given by Julian C. Smith, M.E.I.C., on the design and construction of the new 41,000 turbine unit which had been inspected at the plant of the Dominion Engineering Works that morning. Mr. Smith's paper will be printed in a later number of *The Journal.*

At the evening session a very interesting paper on "The New St. John Cantilever Bridge" was given by Major Draper, describing the numerous unique features of the design and construction. The reading of this paper concluded the Professional Meeting.

Members of The Engineering Institute of Canada photographed at the Dominion Engineering Works Limited at the time of the Annual Convention of the Institute, showing the metal turbine cast steel scroll casing for the forty-one thousand horse power turbine, the largest of its kind ever manufactured, having a weight of two hundred and thirty-eight tons.

Retiring President's Address

J. M. R. Fairbairn D. Sc., M. E. I. C.

Delivered on Jan. 24th, 1922 at Headquarters, Montreal.

When looking back over the past year and endeavouring to look toward the future, with a view to preparing something to say to you to-day, I am immediately led to wonder why custom has decreed that the President of *The Institute* should make his Annual Address at the end of his term of office, instead of at the beginning as is the custom in the Institution of Civil Engineers of Great Britain. If permitted to address *The Institute* at the beginning of the term, one could most pleasantly refer to the mistakes of his predecessors in office, delicately regret the lack of progress in the past, but, with due and becoming modesty, prophesy as to the rosy and successful future that may lie before *The Institute*, knowing full well that he will, at the end of his term hand over to another the results of his own mistakes without having in any way to answer for them. It being decreed otherwise, your President, at the end of his term must seemingly give an account of his own stewardship and prophesy as to the future of *The Institute* under the regime of his successor.

Making Annual Address at Beginning Instead of End of Term.

Before doing this, however, it may be worth while to dwell for a moment seriously on this very point. A newly elected president, at the beginning of his term of office, if making his address then, has a suitable opportunity to express in fitting terms his appreciation of the honour done him by his fellow engineers in electing him to office, an opportune moment to review the history and progress of the organization he is addressing, and a most fitting theme on which to dilate in stating to his fellow members his hopes and ambitions for the future, as well as his policy in trying to bring these into being. His fellow members, on the other hand, are taken into his confidence at the beginning of his term and, knowing his views, can aid and abet him in carrying them out, or caution and advise him as to their probable outcome, as may seem to them best for the welfare of their organization. A change in our procedure on this point is worth thinking over. I commend it to your consideration.

Signs of the Times

Reviewing the past year from the engineer's point of view is a somewhat serious affair. The reaction from the intense activity of the war period, which set in shortly after the signing of the Armistice and has been gathering impetus as it progresses, has now we hope reached its maximum, and, though there must be a constant downward trend in commodity prices for some time yet, it is to be devoutly hoped that with this downward trend there will be a sufficient increase in the demand for manufactured goods to start our industrial life once more on the way to normal production and a need for expansion. Large numbers of our membership, particularly the younger members, have suffered from the depression of the past year, and to many of our older members, who are more permanently established, this has been a matter of considerable concern, every effort being made, wherever possible, to aid those who were in need of it to secure employment. It is impossible to forecast how long industries will remain on their present short time basis. Already there are signs of improvement. Here and there we find groups of labour accepting sensibly the lowering of wages so necessary to get commodity values back to that point where trade will again begin to move briskly. These signs, though comparatively few and far between as yet, are indications of what may be looked forward to, and encourage the hope that it may not be long before we will have again embarked upon a period of industrial progress and expansion, leading to a demand which will create plenty of employment, not only in the field of ordinary and skilled labour, but in the professional engineering field as well.

"Carry On"

In a country such as ours, where vast areas await only the tilling of the soil, and illimitable natural resources only the advent of properly directed labour, with its inseparable partner — capital — to give to man with lavish hand the food and clothing to live and the power and raw materials with which to earn a living, it is impossible that a condition of depression can long exist among a young and energetic people. It is for us to-day to "Carry on", doing each his part to help his fellow over the low spots, and we will soon find ourselves surrounded by that activity and solid progress which is the natural condition of an intelligent and industrious nation.

Progress of Institute

While it is much easier, when considering the general conditions in our own country, to enthuse over the future than over the immediate past, a survey of the work of our own organization, *The Engineering Institute of Canada*, permits one to become enthusiastic over even the results of the past year's progress, as well as to look forward to a bright prospect of greater usefulness in the future. In many ways *The Institute* has made gratifying progress during the past year, the evidence of it being most apparent in the work of the twenty-two Branches which we now have scattered throughout the country. This work and its advantages to the individual member of a Branch apparently appeal to the membership at large, as several new Branches have been formed during the year and still others are now in prospect. The work of the various Branches has already become the most important activity of *The Institute*. It is still gaining in importance and is I believe leading our membership along lines calculated to do the most good in bringing out and developing each individual member of a Branch, making him more valuable to the community in which he dwells, and thereby improving the status of the

engineering profession as a whole. In making themselves felt outside of their own membership, by the holding of open meetings, social functions, etc., the Branches have created an interest among the general public and among engineers, not previously members of *The Institute*, which would appear to be largely responsible for the tremendous increase in membership which the last year has witnessed, in spite of the depressed condition of affairs throughout the country.

Financial Condition

This large addition to our membership is not only evidence of the interest and enthusiasm created by our Branches, but is a most potent factor in building up our revenues and putting the affairs of *The Institute* on a healthy and substantial basis. From the financial point of view, all members of *The Institute* are valuable, but particularly is the new member so in his first year, as he pays, not only his annual dues, but his entrance fee as well. It is a source of considerable gratification to the Council that this year, for the first time in the history of *The Institute*, despite the fact that the proposed increase in fees was turned down by ballot at the last Annual Meeting, they have been able to present to you a financial statement showing such a surplus on this year's operation. The Council has every hope that this will permit of a sum of being set aside this year to pay off the obligations of money *The Institute*, which sum will represent approximately the entire entrance fees of all members taken into *The Institute* this year. It has long been felt that all entrance fees should properly be used for Capital Account, and that Maintenance and Operating Expenses should be held down to a point where they can be met by the Current Annual Dues of the membership and Other Regular Sources of Annual Revenue. It is to be hoped that *The Institute's* affairs may so flourish that the precedent set this year can be followed in the future.

Growth of Institute

The year just passed shows a very marked contrast between the trend of business affairs throughout the country and the progress of *The Engineering Institute.* While business has been slowing down, the growth of *The Institute* has been speeding up.

Extending Charts

In January, 1917, Dr. G. Herrick Duggan, when retiring from office as your President, presented a series of charts showing graphically the increase in membership since the incorporation of *The Institute* in 1887. It seems appropriate at the present time to extend these charts to the end of 1921 and present them once more for your information.

First Chart

As shown on the first chart, there were, at the end of 1916, some 700 members, some 1400 associate members,

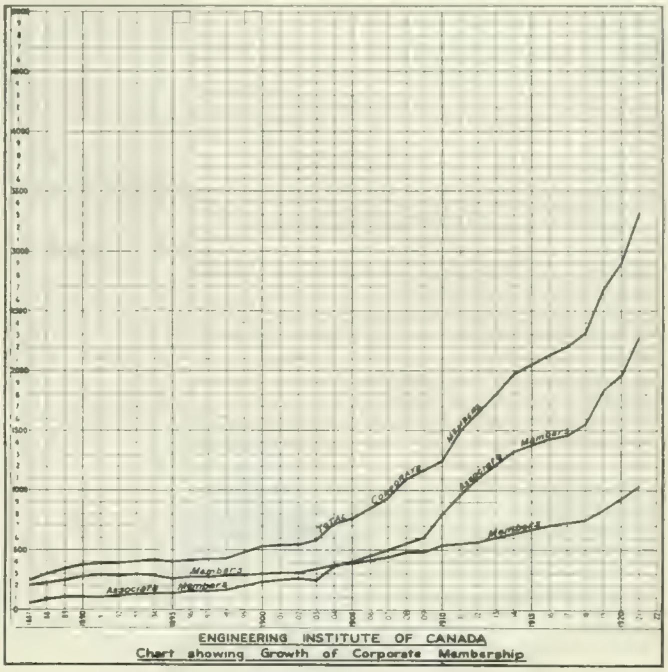

Figure 1.

or a total of some 2100 corporate members. This chart indicates the greatly accelerated increase in membership which has taken place since the Armistice, which has now carried the number of members to slightly over 1000, the number of associate members to very nearly 2300, and the total corporate members to somewhat over 3300. The fact that the increase in corporate membership was greater during 1921 than during any previous year would seem to indicate that it has by no means yet reached a peak, and I believe that you are justified in expecting your corporate membership to continue to increase at a very rapid rate for some time yet to come.

Second Chart

As shown on the second chart, there were at the end of 1916, some 900 non-corporate members, some 2100 corporate members, and a total membership in *The Institute* of just under 3100. Although during the war period your corporate membership continued to increase at a reasonable rate, the non-corporate membership varied materially from year to year, in such a manner as to make a relatively slight increase in your total membership between the end of 1912 and the end of 1918. After the Armistice, however, the non-corporate membership began to increase relatively as rapidly as the corporate membership, so that between the end of 1916 and the end of 1921 the total membership of *The Institute* increased from slightly less than 3100 to practically 4900, or a total increase for the five years of approximately 1800 members. I believe this chart also warrants the belief that *The Institute*, insofar as membership is concerned, is but now starting to rise on a wave of prosperity.

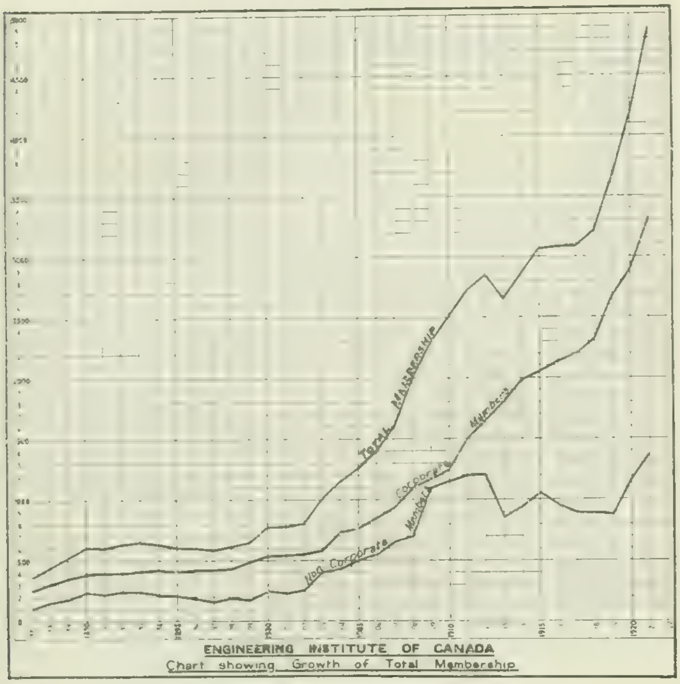

Figure 2.

Third Chart

The third chart, which shows the geographical distribution of your membership with the exception of students, is I believe even more gratifying. Although there has been a slight decrease in your total membership resident in the United States and other foreign countries, the Dominion-wide interest in *The Institute* which has been aroused is very clearly indicated by the fact that there has been an increase in membership in each one of the provinces since 1916. Ontario leads by a wide margin in this increase, but the trend for all of the other provinces is very markedly upward.

Fourth Chart

The fourth chart shows this same information in percentage rather than in actual numbers, and, while there is a decreased percentage of membership in the older and more settled provinces, there is an increase in the newer and less settled provinces, which is most gratifying. This indicates that the membership is becoming more equally distributed and that the engineering profession throughout Canada is all the time becoming better represented in the major engineering organization of the Dominion.

Fifth Chart

The fifth chart brings out very clearly the present geographical distribution of your membership. Well over 50% is resident in the Provinces of Ontario and Quebec, which, on account of the greater population of these provinces, is to be expected. It is my hope, however, that as time progresses and the population of the Dominion becomes more equally distributed, the percentage columns of the other provinces will tend to rise and in so rising automatically reduce the height of the columns representing the older provinces, so that ultimately your membership will approach the ideal of equal numbers in each of the eight provinces.

Summary of Charts

A study of the five charts just described cannot but enthuse one as to the future. It may be felt that the remarkable increase in membership shown during the last three years is perhaps accounted for by the return to civilian life of so many young men just starting out in their life's career, but it is my belief that such membership increase as may be due to this cause is more than offset by the hardship felt, during the declining market for engineers of the past three years, by those from whom we ordinarily draw our additions to membership. In any case the increase is a fact, and the most natural explanation for it is the favourable publicity which the excellent work of our Branches has been given among the engineering profession. May we not, therefore, feel that as the Branches grow and broaden the scope of their activities, a continuance of the rapid increase in our membership may be expected.

Organization

We have already 22 Branches, and, as these increase in number and in strength, it is evident that the parent body, or headquarters organization, must also increase or be modified in such manner as may seem necessary, in order to properly and efficiently co-ordinate the work of these Branches, and function as a tie to hold them together

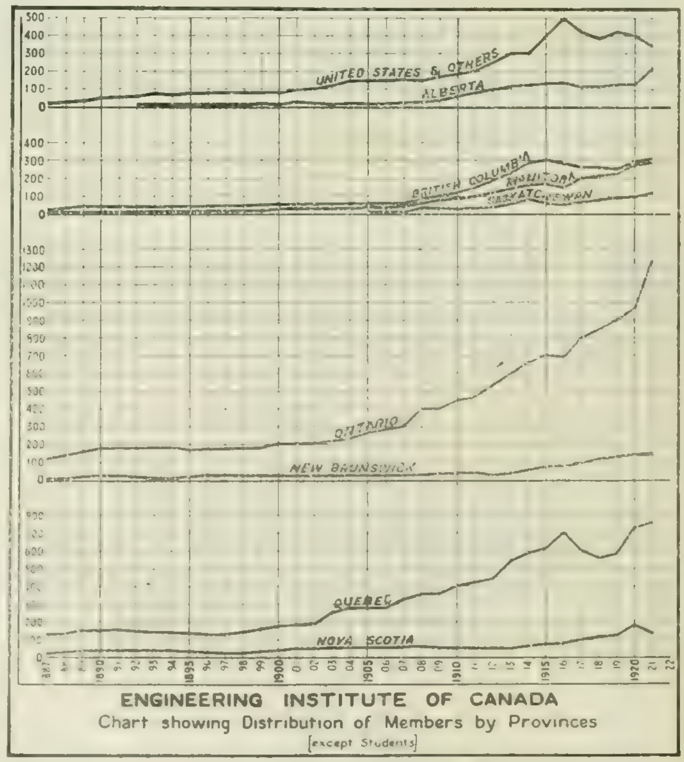

Figure 3.

and a clearing house through which there may be the freest interchange of ideas, proceedings and general results of Branch work. The ultimate success of *The Institute* lies, primarily, in keeping the Branches in close touch with one another and thus enabling *each little group of us* to work with *every other group of us* toward our ultimate goal — that *all of us* may be of the greatest possible service to thepublic at large and, therefore, to the engineering profession as a whole.

Members in Outlying Districts

One of the problems which will have to be met in the near future is how to interest those of our members in outlying districts whose location does not permit their participation in Branch affairs. They are at a distinct disadvantage and some means will have to be found whereby they can be brought into closer touch with the work of their fellow engineers. Just how this can be done is not clear, but, already, indications of unrest on the part of some such members are becoming evident, and a most careful consideration should be given to this subject in order that their interests may be served and their co-operation maintained.

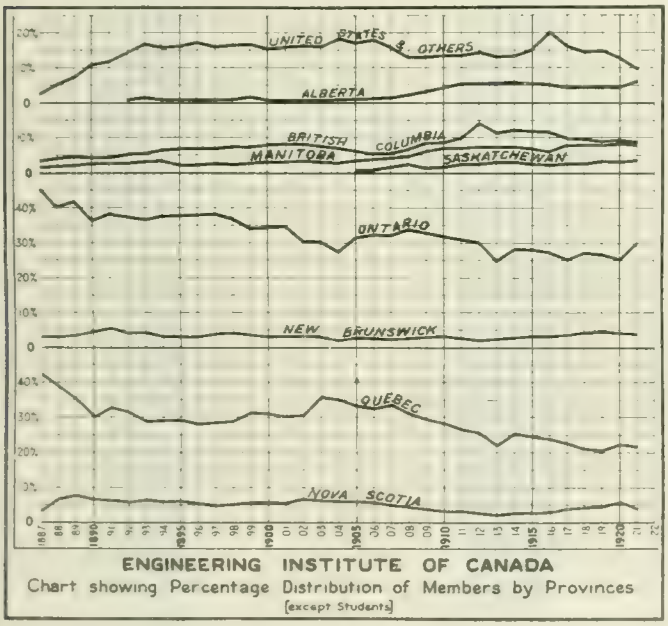

Figure 4.

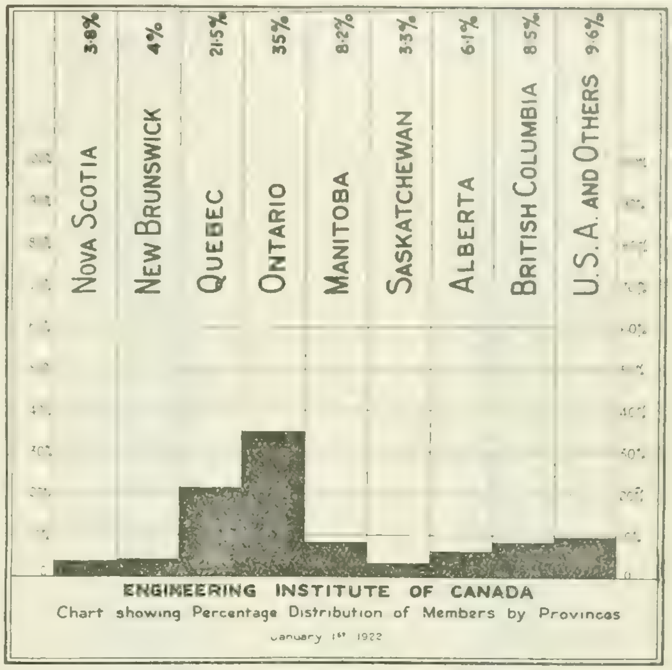

Figure 5.

Questions to be Kept in Mind

We have now reached a stage in the condition of the profession where it seems wise to keep before us several questions upon which *The Institute* can be of the greatest value. Such matters as *professional ethics; publicity of a suitable and dignified character; the enrollment of all engineering students at our universities in our membership; the possibility of adding to the classes of membership, or of broadening some of the existing classes, to take in more of those in the engineering field, or associated with it, who are not now eligible under the existing classes,* and a number of other questions more or less related to these, some of which are now under consideration by the various committees, should be kept in mind and, where possible, definite policies in regard to them adopted. With the Branches heartily co-operating in the carrying out of such policies, and the stimulation of interest in these matters which their co-operation would immediately bring about, there lies before us an opportunity for growth, expansion and improvement as a body which should make *The Engineering Institute of Canada* a most potent factor in determining the position which our membership will hold in their respective communities and the respect which the profession as a whole will command in the public mind.

Thirty-sixth Annual and Professional Meeting

Registration

	Name	Address
1	Charles M. McKergow	Westmount.
2	A. L. Patterson	Montreal.
3	George T. Clark	Toronto.

CORRESPONDENCE

Canadian Electrical Association Meetings

Editor, *Journal:*—

Dear Sir,

Referring to your letter of the 6th inst., re dates of meetings for the Montreal Section of the C.E.A., I beg to advise you that the Programme Committee at their meeting of recent date, have decided to hold meetings on the following dates:—

Jan. 16—"Paper on Illumination", by Geo. K. McDougall.

Feb. 6—"Address", by M. H. Aylesworth, executive manager, National Electric Light Assoc., New York.

" 27—"Paper on Electrical Protective Devices", by a speaker supplied by J. W. Pilcher.

Mar. 20—"Paper on Meters and Metering", by a speaker supplied by Chas. F. Medbury

Apr. 10—"Paper on Merchandising", by Geo. Atchison.

" 24—"Social Evening for the closing of the Season".

It was decided to have a meeting every third week, instead of monthly, on account of the season being so short. It might be that some of the subjects referred to in this programme may have to be altered but the dates will very likely remain the same.

I should like to mention that any members of *The Engineering Institute* who should be interested in any of these subjects are welcome at our meetings. Our purpose is to have papers and talks which will be useful to our members without interfering with any of the organized bodies, at present. It is quite possible that some of the members of other associations might be interested in our papers and a welcome invitation is extended to them.

Thanking you for your good wishes for the new year, which I duly reciprocate, I am,

Yours very truly,

EUGENE VINET, A.M.E.I.C.,
Secretary-Treasurer.

Symposium on Water Power

A symposium on Water Power Development is being planned at the University of Toronto under the direction of Professor R. W. Angus, M.E.I.C., head of the Department of Mechanical Engineering, and professor in charge of the hydraulic work at the University. This will take place during the last week in February and the first week in March of this year and each phase of hydraulic power development will be dealt with by a specialist.

A number of eminent hydraulic engineers in Canada and the United States are being invited to contribute to the conference. The discussions will be of distinctly technical character and of interest particularly to practising engineers.

The details are now being arranged and a copy of the programme will be sent when ready to anyone applying to Professor Angus, University of Toronto.

Safety Census

All branches of the engineering profession will watch with close interest the results of the safety census now being taken by the National Safety Council.

The census which the National Safety Council is taking will include all persons engaged in safety and industrial health activities in all industries in all parts of the country, and persons doing public safety work as well. This is the first time any attempt has everbeen made to list all the persons engaged in these activities professionally.

The census will include not only members and employees of members of the National Safety Council, but all persons engaged in industrial safety and health work and public safety work whether connected with the Council in any way or not. Many consulting engineers and other engineers are included in the membership of the Council. The Council works in close co-operation with the leading engineering societies, government bureaus, such as the Bureau of Standards, Bureau of Mines, and other such agencies. Engineering plays a big part in the safety work being carried on under the leadership of the National Safety Council.

Every member of *The Institute* who is professionally engaged in industrial or public accident prevention or industrial health work — whether he is devoting all or only part of his time to accident prevention — is urged to assist in the taking of this census by sending to the National Safety Council, 168 North Michigan Avenue, Chicago, his name and the other date requested in the Council's census form which is reproduced below.

Following is the form which all safety workers are requested to fill in and send to the National Safety Council, 168 N. Michigan Ave., Chicago.

Name..
Company or organization....................................
City.................... State................................
Nature of company's business................................
Is safety your principal work?...............................
Please check other activities you engage in:

Fire protection	Legal
Health and sanitation	Insurance
Workmen's compensation and claims	Welfare
General executive (such as manager or superintendent)	Educational
Engineering (other than safety)	Industrial relations

How long have you been in your present position? ....
Technical or other special education?.........................

Signed..
Title..

EMPLOYMENT BUREAU

Situations Vacant

Town Engineer.

Applications will be received until February 10th 1922 for position of Town Engineer for the town of Oshawa, Ont. Applicant must bee xperienced and thoroughly capable of taking charge of all branches of municipal work. Apply giving references to F. E. Hare, Town Clerk.

Members Exchange

Transit and Level for sale

Keuffel & Esser Transit:—6½″ Hor. Limb, 5″ Vertical Arc. and 11½″ telescope. In first class condition. If new, catalogue value would be $507.00.

Keuffel & Esser Level:—15″ Y Level. In first class condition. If new, catalogue value would be $254.00.

Two Split Tripods:—All may be examined at Keuffel and Esser, 5 Notre Dame Street, West, Montreal. Apply Box 20-A

Tenders.

Tenders will be received from manufacturers up until noon March 1st, 1922 for Dual Drive, 100 K.W., D.C. Generator, 3 wire, 125-250 volt, one drive to be E.H.N.C. turbine, the other 2 phase, 60 cycle, 2200 volt motor. Plans and specifications can be obtained from the office of A. R. Greig, M.E.I.C., Superintendent of Buildings, University of Saskatchewan, Saskatoon, Sask.

ELECTIONS AND TRANSFERS

At the meeting of Council held on January 17th, 1922, the following elections and transfers were effected:—

Members

John Fawcett Bell, Commander-Engineer in charge of H.M.C.S. Aurora and fleet engr. officer, Halifax, N.S.

Edward Victor Buchanan, gen. mgr., Public Utilities Commission, London, Ont.

Charles Frederick Draper, B.A.I., Trinity College, Dublin., res. engr., C.P.R. cantilever bridge, St. John, N.B.

Frederick William Farncomb, private practice, London, Ont.

Donald Ernest Grant, in control of all activities of the Armstrong group of firms in North America, Montreal, Que.

Thomas Montgomery, chief engr., Sarnia plant, Imperial Oil, Limited, Sarnia, Ont.

Associate Members

Reginald deBruno Austin, Secretary, Turbine Equipment Co. Ltd., Toronto, Ont.

Charles Walter Brown, B.Sc., (C.E.), Univ. of N.B., engr., J. A. Grant & Co. Ltd., Engrs. and Contractors, St. John, N.B.

Robert Edwards Butt, dftsman.. Canadian Westinghouse Co. Ltd., Hamilton, Ont.

Harold Belbin Fisk, gen. mgr., Walsh Plate & Structural Works, Ltd., Drummondville, Que.

Noel Faure Harrison, Manitoba Power Commission, Winnipeg, Man.

Joseph Albert Laniel, asst. engr. Dept. P.W. Canada, London, Ont.

Thomas Ernest McGrail, engr., C. A. Dunham Co., Ottawa, Ont.

William Andrew Robinson, (Grad. S.P.S. Univ. of Toronto), district engr., Good Roads Board, Winnipeg, Man.

William Gordon Scott, B.Sc., McGill Univ., plant engr., Northern Electric Company, Montreal, Que.

Sidney Snell, gen. mgr. and engr., British American Fuel & Metals Ltd., Toronto, Ont.

John LeMoirrey Tait, consltg. engr., St. Lambert, Que.

James Weir, B.Sc., (McGill Univ.), asst. professor of geodesy and surveying, McGill University, Montreal, Que.

Samuel Raymond Weston, B.Sc., (Univ. of N.B.), asst. chief engr., N.B. Electric Power Commission, St. Johns, N.B.

Associates

William Charles Franz, President, Algoma Steel Corporation, Sault Ste. Marie, Ont.

David Livingstone McKeand, asst. director, Northwest Territories and Yukon, Department of the Interior, Ottawa, Ont.

Donald Minto McLean, Dominion Engineering Works, Ltd., Montreal, Que.

Juniors

Arthur Dale Bishop, B.S. (C.E.), (Univ. of Vermont), dftsman., Canadian Bridge Co. Ltd., Walkerville, Ont.

Jean B. Garneau, Bach. in Surveying (Laval Univ.), chief of Laboratory for testing materials, Dept. of Highway, Prov. Govt., Quebec, Que.

Wilder Clifford Goodwin, field engr., St. John Dry Dock & Shipbldg. Co., East St. John, N.B.

Charles A. Grupp, office man, Dept. Public Highways of Ont., at Waterdown, Ont.

Francis Stewart Hartle, of Winnipeg, Man.

Thomas Haliburton Henry, B.Sc. (McGill Univ.), asst. engr. J. P. Porter, Standifer & Porter Bros., St Catharines, Ont.

Francis Joseph Igoe, (Rensselaer Poly. Inst.), Chemist, Canadian General Electric Co., Peterborough, Ont.

George Dean Maxwell, B.A.Sc. (Univ. of Toronto), demonstrator in drawing, Faculty of Applied Science and Engineer, University of Toronto, Ont.

William Cecil Elwood Robinson, of Coldwater, Ont.

Keltie Wilson, instr'man., Dept. P.W. Canada, St. John, N.B.

Kenelm Molson Winslow, B.Sc. (McGill Univ.), dftsman., motive power and car dept., C.P.R. Winnipeg, Man.

Transferred from the class of Associate Member to that of Member

Ewart Gladstone Horne, B.A. (Dartmouth Univ.), vice-pres. and managing director, Lockewood Greene & Co., of Canada, Ltd., Montreal Que.

Percy Oscar Gordon Janes, vice-pres., gen. mgr., and chief engr., Canadian S.K.F. Co. Ltd., Toronto, Ont.

Ibbotson Leonard, (Grad. R.M.C., Kingston), B.Sc., (McGill Univ.), vice-pres. and gen. mgr., E. Leonard & Sons Limited, London, Ont.

Louis William Klingner, (Univ. of Toronto), district irrigation officer, special projects, Baghdad, Mesopotamia.

Charles Joseph Harrison Townsend, B.A.Sc., (Univ. of Toronto), member of firm, Russell Constrn. Co. Ltd., and mgr., Drifting Sand Filter Co. Ltd., Toronto, Ont.

Transferred from the class of Junior to that of Associate Member

Alexander Alderson Anderson, (Grad. R.M.C. Kingston), B.Sc. (McGill Univ.,), asst. engr., chief engr's branch, London District, Dept. P.W., London, Ont.

Henry Gerald Angell, canal supt. in charge of the Bassano Division of the C.P.R. Eastern section irrigation project, Bassano, Alta.

Chiles Manly Barnes, checker, Lackawanna Bridge Co., Buffalo, N.Y.

Byron Conrade Berry, res. engr., sewer section, dept. of works, City of Toronto, Ont.

Paul Raymond Boese, chief engr., Nevada Northern Railway, Ely, Nevada.

Fitz James Bridges, junior engr., district engr's office, London District, Dept. P.W. Canada, London, Ont.

John Brooke Molesworth Parnell, Lord Congleton, B.Sc., (McGill Univ.), Montreal, Que.

Louis Wilfrid DesLauriers, asst. engr. in charge of designing frogs, switches and track materials, C.P.R., Montreal, Que.

Sydney Dawson Fawcett, D.L.S., topographical surveys branch, Ottawa, Ont.

Christopher Edwin Fraser, B.Sc. (Queen's Univ.), res. engr., James, Proctor & Redfern Ltd., Consltg. Engrs., Toronto, Ont.

Meliton C. Garroni, Bach. of Engr'g. and Arch'ture (Malta Univ.), office engr. and dftsman., mtce of way dept., C.N.R. Winnipeg, Man.

Walter Griesbach, B.Sc. (Queen's Univ.), office engr., The Foundation Company Ltd., Montreal, Que.

George Aubrey Jenkins, B.Sc. (Queen's Univ.), supt. in Northwest States and Western Canada, on street and highway constrn. work for Warren Bros. Company (Engineering) Laboratory, Portland, Oregon.

Samuel Ralph Keemle, chief engr., Chatham, Wallaceburg & Lake Erie Rly., Chatham, Ont.

Albert John Kelly, B.Sc. (McGill Univ.), asst. professor of surveying and head of the dept. of surveying and geodesy, McGill University, Montreal, Que.

Henry Fairweather Morrisey, M.Sc. (Univ. of N.B.), district engr., Marine Dept., St. John, N.B.

Charlie Berford Shaw, i/c of dfting office, Abitibi Power & Paper Co., Iroquois Falls, Ont.

Osborne Harris Shenstone, B.S. (Mass. Inst. of Tech.), supt., Weston Works, Massey-Harris Company, Toronto, Ont.

Ronald Harrover Stenhouse, res. engr., C.P.R., Kipawa, Que.

Harold Heard Vroom, B.Sc. (McGill Univ.), Northern Electric Co., Montreal, Que.

Transferred from the class of Student to that of Associate Member

Chester Winfield Boast, B.Sc. (McGill Univ.), of Richmond, Que.

Edgar C. Cowan, B.A.Sc., (Univ. of Toronto), munic. engr., Municipality of Springfield, for Good Roads Board, Winnipeg, Man.

Charles Hibbert Donnelly, B.Sc. (Queen's Univ.), Hydro-Electric Power Commission of Ontario, Niagara Falls, Ont.

Harry L. Dowling, B.A.Sc. (Univ. of Toronto), struct'l. Engr., Barber, Wynne-Roberts & Seymour, Toronto, Ont.

Alan Ferrier, B.Sc. (McGill Univ.), of Ottawa, Ont.

Leon Fernand Mackay, B.Sc., C.E. (Laval Univ.), divn. engr., Quebec Roads Dept., Montreal, Que.

Donald Keith Macleod, B.Sc. (McGill Univ.), i/c of installation and operation of Canadian Branch of Ohio Brass Co., Barberton, Ohio, at Toronto, Ont.

William Miles Miller, (Grad. R.M.C. Kingston), Capt., Royal Corps of Signals, Maresfield Park, Uckfield, Sussex, England.

Paul Emil Mathias Rosenorn, estimator, Graham & Windsor, General Contractors, Montreal, Que.

Francis Edward Weir, B.A.Sc. (Univ. of Toronto), asst. engr., Dept. Public Highways of Ontario, Hamilton-Queenston Highway, Beamsville, Ont.

Transferred from the class of Student to that of Junior

William Herbert Bennet, B.Sc. (Queen's Univ.), res. engr., Backus Brooks Co., Kenora Power Development, Kenora, Ont.

Edgar Jabez Buckingham, B.Sc. (Univ. of Man.), asst. dist. Good Roads Board, Winnipeg, Man.

John Campbell Elder, B.Sc., (McGill Univ.), salesman, J. A. Elder, Montreal, Que.

Lawrence Edward Cokayne Frith, B.Sc., (Univ. of Man.), Manitoba Govt. Telephones, Winnipeg, Man.

Paul Gilles Gauthier, B.Sc. (McGill Univ.), demonstrator, McGill University, Montreal, Que.

Thomas Stanley Glover, 4th year student, Univ. of Toronto, Toronto, Ont.

Douglas John Ludgate, B.Sc., (Queen's Univ.), res. engr., Schroeder Mills & Timber Co., Pakesley Ont. and Key Valley Rly. (private line).

Albert Edward Macdonald, B.Sc., (N.S. Tech. Coll.), studying for M.Sc. at McGill University, Montreal, Que.

Brouard Hunter Tyndall Mackenzie, (Grad. R.M.C. Kingston), B.Sc. (McGill Univ.), junior engr., Coverdale & Colpitts, Consltg. Engrs., New York, N.Y.

James O'Halloran, B.Sc. (McGill Univ.), asst. mech. engr., Abitibi Power & Paper Co. Ltd., Iroquois Falls, Ont.

Basil C. Salamis, B.Sc. (McGill Univ.), with Jas. Atsalinos, General Contractor, Montreal, Que.

Raynond Donald Stiles, B.Sc. (N.S. Tech. Coll.), inspr. for Jackson & Moreland, Boston, Mass., taking inventory of equipment of N.S. Tramways & Power Co., Halifax, N.S.

John LeRoy Underhill, Riviere du Loup Station, Que.

British Industries Fair

The function of the British Industries Fair is to bring buyers and sellers together and to facilitate business between them. Goods can be inspected, prices compared and definite orders placed at the Fair.

Since its inception in 1915, the British Industries Fair has grown until it is to-day the most important national trade fair in the world. For the 1922 Fair it has fortunately been possible to secure enough additional accommodation both in London and Birmingham to provide not only for the annual growth of the Fair, but also to find room for the great industries which have hitherto been exhibited at Glasgow. Textiles, however, will not be included in the 1922 Fair.

A very large number of industries will be represented at the Fair and a descriptive pamphlet containing a list of such will be mailed to intending visitors, together with a complimentary admission card, on application to the British Trade Commissioners in Canada. Their addresses are:—248 St. James Street, Montreal; 260 Confederation Life Building, Toronto; and 610 Electrical Railway Chambers, Winnipeg.

Toronto Meeting, American Association for the Advancement of Science

By Horace L. Seymour, A.M.E.I.C., Secretary of the Local Committee.

The Toronto Meeting of the American Association for the Advancement of Science and of the Associated Scientific Societies, which was held during the last week of the year just ended, was the 74th meeting of the Association, and the second time that such meetings have been held in Toronto. The total number of those who registered was 1,832, geographically distributed as shown below:—

England, Belgium and Japan.....	12
United States (including Hawaii and Philippine Islands)......	867
Canada........................	953

From the City of Toronto there were registered 686, but practically every province and state in Canada and United States was represented. A number, and probably a considerable number, attended some of the meetings without registering. And the writer had the pleasure of talking to a man of science from Denmark, who apparently forgot to register.

The object of this article is to indicate the part played by members of *The Engineering Institute of Canada* and also to indicate in some way the value of such meetings to engineers.

The meeting of the Association was held in Toronto on the invitation of the University of Toronto and the Royal Canadian Institute. The sessions were held in the various buildings of the University, the majority of the members being conveniently housed in the various University Dormitories. Meals were served in the University Dining Hall. The visitors, one and all, seemed to be delighted with the arrangements which they declared were almost ideal for a meeting of this size.

In recent years the engineering section has not been at all active. There are several reasons for this which need not be mentioned here. However, this year the section was revived, its programme being considered a very important part of the meeting of the Association. Great credit is due to the very efficient work of Mr. J. B. Tyrrell of Toronto, Vice President of the Engineering Section and Chairman at the meetings. He was ably assisted by Professors Robt. W. Angus, M.E.I.C., and Peter Gillespie, M.E.I.C., as well as by Prof. C. R. Young, M.E.I.C., who represented the Society for the Promotion of Engineering Education, which met with Section "M" (the Engineering Section).

The Engineering Programme began on Tuesday, Dec. 27th, 1921, with an address on "Natural Resources and National Welfare" by Sir Clifford Sifton, formerly Chairman of the Commission of Conservation. To relieve the fuel situation, Sir Clifford advised the coking of coal where possible from the mines of Nova Scotia and Alberta, the value of the by-products being pointed out. He expressed the belief that peat deposits would yet be found of real value.

Then followed papers as below:—

"Optical Determination of Stress Distribution in Engineering Problems," by Paul Heymans, University of Ghent.

"Return Current along Submarine Cables," by Chas. Manneback, University of Louvain.

On Wednesday morning, John Murphy, M.E.I.C., electrical engineer, Department of Railways and Canals, Ottawa, employed moving pictures to illustrate his excellent talk on "Ice Formation and Prevention with Special Reference to Frazil and Anchor Ice."

R. J. Durley, M.E.I.C., Secretary of the Canadian Engineering Standards Association, Ottawa, addressed the meeting on "Engineering Standardization".

The following papers on Mining were then delivered:

"Fifty Years of Progress in Mining in Canada," by John E. Hardman, M.E.I.C., consulting mining engineer, Montreal, Quebec.

"Metal Mining in Canada," by Thos. W. Gibson, Deputy Minister of Mines, Ontario.

"Gold Mining in Ontario," by A. F. Brigham, General Manager, The Hollinger Mine, Ontario.

"Nickel Mining and Smelting," by W. L. Dethloff, M.E.I.C., chief engineer, The Mond Nickel Company, Ontario.

On Thursday, Geo. T. Clark, A.M.E.I.C., chief designing engineer of the Toronto Harbour Commission gave an illustrated address on "Toronto Harbour Development" followed by an address on "Industrial Research" by R. A. Ross, M.E.I.C., Chairman, Honorary Advisory Council for Scientific and Industrial Research, Canada.

Other Thursday papers were as follows:—

"Railway Development in Canada," by H. K. Wicksteed, M.E.I.C., formerly chief locating engineer, Canadian Northern Railway.

"Exploration for Oil in Western Canada," by A. M. McQueen, Vice-President, Imperial Oil Company, Toronto.

"Coal Mining in Alberta," by James McEvoy, M.E.I.C., consulting coal mining engineer, Toronto.

Sir Adam Beck, Chairman of the Hydro-Electric Commission of Ontario addressed a general session on Thursday afternoon, under the auspices of Section "M" (Engineering). His subject was "Hydro-Electric Developments in Ontario". These developments, he said, had been due to the men of pure science as well as to those of applied science—the electrical and hydraulic engineers.

Following the illustrated address by D. B. Dowling of the Geological Survey of Canada on "Engineering Features of the Development of the Mackenzie River Oil Field" Friday was devoted to some consideration of the problems of engineering education.

A great deal of interest was shown in and considerable discussion aroused by the following papers:—

"Relation of Industry and the Practicing Engineer to Engineering Education," by R. C. Harris, commissioner of works, Toronto.

"Professional Engineering Education for the Industries," by Prof. Chas. F. Scott, President of the Society for the Promotion of Engineering Education.

"Engineering Education versus Vocational Training," by F. W. Merchant, director of industrial and technical education, Province of Ontario, and Dugald C. Jackson, Massachusetts Institute of Technology.

On Friday evening the meetings of the Engineering Section were concluded with a dinner. In this dinner the Geological Section joined as well as the following technical bodies:—

Society of Promotion of Engineering Education,
The Engineering Institute of Canada (Toronto Branch).
The American Society of Mechanical Engineers (Ontario Branch).
The American Institute of Electrical Engineers (Toronto Branch).
The Canadian Institute of Mining and Metallurgy (Toronto Branch).
The Society of Chemical Industry (Toronto Branch).

Among the guests at the dinner were Sir Robert Falconer, President of the Universiy of Toronto; Dr. R. T. McDougal, General Secretary, and Prof. B. E. Livingston, Permanent Secretary, of the American Association for the Advancement of Science. The engineers considered themselves extremely fortunate in entertaining such honoured guests, as several dinners of other Sections and Societies were being held on the same evening. It was on the other hand, an indication of the importance attached to the Engineering Section.

A meeting of this magnitude requires a great deal of attention to numerous details. In attending to these engineers had a prominent part. On the Local Committee, there were included the following members of the staff of the Faculty of Applied Science:—Dean C. H. Mitchell, M.E.I.C.; Professors G. H. C. Wright, J. W. Bain, J. R. Cockburn, M.E.I.C., E. W. Banting and S. G. Bennett. Horace L. Seymour, A.M.E.I.C., was Secretary of the Local Committee with A. M. Reid, S.E.I.C., as assistant.

The Toronto Meeting has meant a great deal for the advancement of science in this country. To engineers it has afforded the opportunity of meeting with men of science under very happy auspices.

The Toronto Meeting has been declared a success, and undoubtedly engineers and members of *The Engineering Institute of Canada* helped to make it so.

Meeting of Practising Engineers in Chicago

The American Association of Engineers will hold a conference of practising engineers at the Congress Hotel in Chicago on Wednesday February 22, Washington's birthday.

The tentative programme includes the following subjects:

How to sell engineering service,
Experience of the practising engineer with licensing,
(a) State reciprocity,
(b) Licensing of engineering corporations,
Publicity for practising engineers,
Cost accounting for engineering service,
Bookkeeping for an engineering office,
How to uphold the standards of services and fees,
Amendment of schedules of services and fees,
(a) Providing for other branches, such as mining and mechanical,
(b) To fit them to the practice appertaining to the several parts of the country,
Computing the practising engineer's income tax.

An invitation to attend the conference will be extended to all practising engineers whether members of the Association or not who are interested in the subjects on the program.

That the conference may be of the greatest benefit to the profession depends to a considerable extent on a large attendance and if you will announce the meeting in an early issue of your paper, we shall appreciate it.

OBITUARIES

Eugène D. Lafleur, B.A.Sc., C.E., M.E.I.C.

The distinguished career of an eminent member of the profession came to a close on December 14th last in the sudden death of Eugène Damase Lafleur, Chief engineer of the Department of Public Works of Canada.

Born at Montreal on August 5th, 1861, the son of the late Edouard Lafleur, notary and of Eliza Holmes, the late Mr. Lafleur was educated at Montreal College, afterwards taking a course in Engineering at the Polytechnic School, from which institution he graduated in 1881, with high honours, winning the Peter S. Murphy gold medal for proficiency.

For over forty years Mr. Lafleur was connected with the Department of Public Works, having entered the employ of the Government upon the completion of his studies in 1881 as assistant to R. Steckel, who was then engaged on Geodetic Surveys and Precise Levelling Operations in Quebec and the Maritime Provinces. His remarkable talent and sterling qualities soon won him the esteem and appreciation of his superiors. In a few years he became chief of party, conducting important surveys for Harbour and River Inprovements, later on supervising the construction of Departmental works in the Eastern Provinces. Following the retirement of Louis Coste in 1899, Mr. Lafleur became acting chief engineer, being subsequently appointed chief engineer, December 1st, 1904.

Mr. Lafleur had charge of the Hydrographic Survey, River St. Lawrence 1897-1898, was chief engineer of the Georgian Bay Ship Canal survey, 1904-1905 and in 1906 reported favourably on the feasibility of the P.E.I. Tunnel.

The many important public works, such as deep water wharves, graving docks, harbour improvements, etc., etc., built during the last twenty-five years throughout the Dominion bear strong testimony to the engineering ability and sound judgment possessed by the late Mr. Lafleur.

Mr. Lafleur was a Member of *The Engineering Institute of Canada* since its foundation in 1887, and Councillor of *The Institute* 1916-17-18. Members will learn with profound sorrow of the loss of one of their most sympathetic and kind hearted confrères.

Mr. Lafleur is survived by his wife, formerly Miss DuPlessis, daughter of the late T. C. DuPlessis, and three daughters, Mrs. Edouard Cholette, of Montreal, and the Misses Eugenie and Gabrielle Lafleur, living at home.

E. D. LAFLEUR, M.E.I.C.
Late Chief Engineer, Public Works of Canada.

The funeral, which took place on the 17th instant, was largely attended by the staff of the Department, the members of the Ottawa Branch of *The Engineering Institute* and by many prominent citizens of the Capital.

Thomas Drummond, A.M.E.I.C.

The death occurred early in the morning of December 22nd 1921 of Thomas Drummond, A.M.E.I.C. Mr. Drummond was born in Edinburgh, Scotland, in 1856 and came to Canada at an early age where he engaged in the profession of surveying. After having obtained the diplomas of Dominion Land Surveyor and Dominion Topographical Surveyor, Mr. Drummond graduated in 1883 with the degree of B.A.Sc., from McGill University. Following graduation Mr. Drummond engaged in his profession as surveyor and was employed on many important surveys by the Dominion Government. He was also interested in mining engineering in British Columbia, acting as a surveyor and mining engineer in connection with various Western mines.

During his later years Mr. Drummond was resident in Montreal and was prominent in promotion of amateur sport. He was a life member of the Montreal Amateur Athletic Association, one of the most prominent members of the Montreal Ski Club and an active member of the Kanawaki Gold Club of which he was one time president. He was elected an Associate Member of *The Institute* in 1899. Mr. Drummond was highly respected by all who knew him and his loss is greatly felt in Montreal.

Byron Hallock, A.M.E.I.C.

Byron Hallock, A.M.E.I.C., died at Winnipeg General Hospital, November 27th 1921. He had been a victim of diabetes for a number of years and death resulted from a complication arising therefrom.

Mr. Hallock was born 46 years ago at Forrest, Ontario; came West in 1902 and was employed by the Winnipeg city engineer as leveller; remained with the department until his death, having risen gradually to the position of field engineer, in charge of all field work in connection with construction of Local Improvements. He was elected an Associate Member of *The Institute* in October 1919.

Mr. Hallock was interested in many branches of sport. When he first came to this part of the country, he was one of the best amateur baseball pitchers, for the last fifteen years he has been one of our most prominent curlers, his greatest success being the winning of the Grand Championship and two other trophies in 1916, he served on the Council of the Manitoba Curling Association for several years. He was a great sportsman and never failed to be out after the birds when shooting season opened.

Mr. Hallock was a widower, and leaves two daughters aged 16 and 14, to mourn his loss.

Arthur E. B. Hill, M.E.I.C.

It is with very sincere regret that the Vancouver Branch advises the members of *The Institute* of the death of Arthur Edmund Breton Hill, B.A.Sc., M. Inst., C.E., B.C.L.S., M.E.I.C., which occurred at his residence 1622 Parker St., Vancouver, B.C., on Wednesday, 28th December 1921. The news of his sudden decease, which was the result of a paralytic stroke, came as a distinct surprise to many of his friends. He is survived by his wife, Marion R. Graham, and one daughter, Annie G. Hill, B.A; also two sisters, Mrs. C. H. Harrington of Sydney, C.B., and Mrs. G. W. Boggs of Vancouver, B.C. The burial took place at New Westminster.

Mr. Hill was the son of the late John Lewis Hill of Sydney, C.B., being born at Hillside, Nova Scotia. He was 76 years of age, and came of United Empire Loyalist stock, whose sterling characteristics were deeply stamped into his personality. In 1875 he graduated from McGill University and joined the engineering staff of the C.P.R. in 1881. Five years later he came to British Columbia to take a position as engineer and manager of the Coquilstam Waterworks Company, and subsequentlyde signed and supervised the construction of the waterworks system of the City of New Westminster.

He was employed on the final location and construction of the Canadian Pacific Railway when that line was being completed through the Rockies, and later spent a number of years on the construction of the Grand Trunk Pacific Terminals at Prince Rupert. He was also engaged on the original Sumas Dyking Project and the last eight years of his active life were spent in the service of the B.C. Electric Railway in the capacity of land surveyor for that Company.

In 1896 he set an example for the younger members of *The Institute,* by entering public life as alderman for the City of New Westminster, during which time he served as chairman of the railway committee.

Mr. Hill was a member of the Institution of Civil Engineers and a charter member of the Corporation of British Columbia Land Surveyors. It is interesting to note that he became a member of the Canadian Society of Civil Engineers two days after its incorporation.

During his long residence in British Columb... Hill was a keen student of its development in refe... to public works. He was the originator of the muc... discussed project for connecting the North and South shores of Burrard Inlet, Vancouver, by means of a great rock and earth filled bulkhead across the second Narrows.

By constructing such a bulkhead or causeway, he proposed to furnish unlimited facilities for highway and rail communication between the north and south shores of Burrard Inlet at practically zero grade, and at relatively low cost.

Mr. Hill married in 1890 Jane Harden Graham daughter of Hugh Graham of Huntingdon, Que., and cousin of Sir Hugh Graham. She died in 1904, leaving one daughter, Anne Graham Hill. He married in 1909 Marion Robina Graham, youngest daughter of the late Hugh Graham, by whom he is survived, also by his daughter, Anne Graham Hill, B.A.

Mr. Hill was a man of aristocratic appearance and clean, manly character. His tall, erect figure and sterling personality will be sorely missed by all his professional and business associates, among whom he was held in the very highest admiration and respect. In his death Canada has lost one more of her rugged pioneers, and *The Institute* a loyal and trusted friend.

PERSONALS

F. A. Chisholm, A.M.E.I.C., is now with the Southern Canada Power Company Limited.

V. F. Murray, A.M.E.I.C., is returning to Great Britain and will be resident in Cupar-Fife, Scotland.

A. M. ROBERTSON, S.E.I.C.
Winner of Students' Prize

Mr. Philip ... for the ... very ir...

P. ACKERMAN, A.M.E.I.C.,
Gzowski Medal Winner.

J. M. Morton, A.M.E.I.C., is now with the Manitoba Power Company, Limited, Winnipeg, Man.

J. A. Moody, A.M.E.I.C., has recently moved to West Vancouver, B.C.

R. J. Lecky, A.M.E.I.C., has returned from Porto Rico and is at present resident in Toronto, Ont.

R. G. MacKenzie, Jr.E.I.c., has been transferred by the Canadian National Railways and is now resident engineer at Stanley, Ont.

U. R. Moore, Jr.E.I.C., is at present with Division No. 4, Hydro-Electric Power Commission, Niagara Falls, Ont.

J. W. Smith, A.M.E.I.C., has been appointed structural engineer with the Toronto Transportation Commission.

E. Hughes, A.M.E.I.C., has obtained leave of absence from his employers and is at present taking a course at Alberta College South, Edmonton South, Alta.

J. M. Purcell, S.E.I.C., is now with the Anglo-Newfoundland Development Company at Grand Falls, Nfld.

Major J. C. Craig, D.S.O., M.E.I.C., has been appointed assistant chief engineer, Gold Coast Harbours and has sailed for Accra, Gold Coast Colony, West Africa.

C. G. Cline, A.M.E.I.C., of the Dominion Water Power Branch, Department of the Interior, is now resident in Ottawa, Ont.

H. S. Philips, A.M.E.I.C., for some time past in the city engineer's department of London, Ont., is now with the City of Hamilton, Ont., under E. R. Gray, A.M.E.I.C.

G. R. Heckle, M.E.I.C., formerly vice-president of D. G. Loomis and Co., has severed his connection from that firm, and has opened up an office in the McGill Building, Montreal, as consulting engineer.

Prof. C. R. Young, member of the Advisory Board of Consulting Engineers for the Detroit-Windsor bridge addressed the Hamilton Branch of *The Institute* on January 13th, on the engineering features of the project.

D. M. FRASER, M.E.I.C.,
President, Dominion Engineering Agency.

Brig.-General A. G. L. McNaughton, C.M.G., D.S.O. A.M.E.I.C., General Staff Branch, Militia Headquarters, Ottawa, Ont., has returned from spending a year in England and is at present in Ottawa.

S. R. Frost, A.M.E.I.C., was elected an alderman of the City of Niagara Falls at the recent elections. The congratulations of Niagara Peninsula Branch are extended to Mr. Frost on his success in heading the polls.

J. F. Wickenden, Jr.E.I.C., has served his connection as contracting engineer with the Horton Steel Works Limited and has joined the engineering and sales staff of The Barrett Company Limited. Mr. Wickenden expects to be located in Montreal.

E. C. Little, A.M.E.I.C., who for sometime past has occupied the position of construction engineer with D. G. Loomis & Sons, Montreal, has gone to Europe on an extended trip, at which time he proposes investigating hydro-electric development possibilities in France.

H. W. B. Swabey, M.E.I.C., recently construction engineer with Lockwood Greene and Company of Canada Limited, has organized the Service Engineering Co., of Canada, 603 New Birks Bldg., which handle a line of special engineering equipment and supplies.

At an investiture held at Government House recently, Brig.-Gen. H. N. Ruttan, M.E.I.C., a pioneer in Winnipeg military circles, was made a companion of the Order of St. Michael and St. George. Seven other local military men received the Order of the British Empire. Long service medals and the Distinguished Service Order were also awarded.

J. E. Vanier, A.M.E.I.C., has returned from a lengthy trip to Europe during which he investigated the use of lime on soils for increased crop production. Mr. Vanier has turned in a report on relative yields of the different crops, to the Quebec Government and will be pleased to supply figures to anyone writing to him at 590 Union Avenue, Montreal.

Mr. M. Fraser, M.E.I.C., who for a number of years specialized as a consulting engineer on power plant work, has organized the Dominion Engineering Agency Limited, of which he is president and managing director, with offices at 24 Adelaide Street, East, Toronto, handling electrical equipment. The firm represents the Cutter Electrical and Manufacturing Co., and Schweitzer and Conrad Inc. Mr. Fraser is a graduate of Heriot Watt College, Edinburgh, in electrical engineering.

At the meeting of Council held on January 10th the Governor General of Canada, Baron Byng of Vimy G.C.B., G.C.M.G., M.V.O., was elected an Honorary Member of *The Institute.* Lord Byng is no stranger to Canadians, having commanded the Canadian Expeditionary Force in France during 1915 and 1916. The work of Canadian engineers during the Great War was particularly noteworthy and it is particularly fitting that His Excellency has now become an Honorary Member of the representative Canadian engineering organization.

Lord Byng was born on September 11th, 1862, the seventh son of the Second Earl of Strafford. He was educated at Eton and joined the army at the age of twenty-one, his first regiment being the 10th Hussars. Lord Byng rose rapidly and was placed in command of the British troops in Egypt from 1912 till 1914. During the Great War, his advance was still more rapid, he commanded first the Cavalry Division, the Canadian Expeditionary Force and finally the Third British Army. At the conclusion of the Duke of Devonshire's term of office, he was appointed Governor General of Canada. Lord Byng has also shown an interest in the activities of *The Institute,* particularly the Ottawa Branch and we offer him a hearty welcome as our newest Honorary Member.

BARON BYNG OF VIMY,
G.C.B., G.C.M.G., M.V.O., Hon. M.E.I.C.

BRANCH NEWS

Victoria Branch

H. M. Bigwood, A.M.E.I.C., Secretary.

Report of Annual Meeting

The Annual Meeting of the Victoria Branch was held on Wednesday, 14th December 1921, at Belmont House. About twenty members were present.

Before the business of the meeting opened, an address was given by Harry Plaskett on 'Super-Helium' in the Stars'. The methods adopted at the Dominion Government Observatory were illustrated, and slides showing spectra of various stars and elements, by which such were identified, were exhibited. The different characteristics as depicted by the spectroscope was explained, and also the discoveries of great scientists who had made spectroscopy their special study.

The address which was listened to with great interest, called forth a very hearty vote of thanks, which was proposed in a fitting manner by E. E. Brydone-Jack.

After the lecture was finished, a short interval followed during which Dr. and Mrs. Plaskett and Mr. and Mrs. Harry Plaskett were introduced to the members present.

The chairman, E. G. Marriott, then called the meeting to order for the business before it: viz. the consideration of reports for the past year and the election of officers for the coming year.

F. G. Aldous and C. F. P. Faulkner were named the scrutineers to count the ballots for officers.

The treasurer, E. P. Girdwood read his financial statement, duly audited, which was adopted.

H. M. Bigwood, secretary, read his report of the year's work, which was also adopted.

Reports from the conveners of the committees on Papers and Branch By-Laws were received.

The result of the ballot for officers was now announced by the chairman, as follows:—

Chairman, P. Philip, A.M.E.I.C.

Vice-Chairman, E. F. Cooke, A.M.E.I.C.

2 Executive members, E. E. Brydone-Jack, M.E.I.C., J. P. Forde, M.E.I.C.

Treasurer, E. P. Girdwood, M.E.I.C.

Secretary, H. M. Bigwood, A.M.E.I.C.

The Chairman congratulated Mr. Philip upon his election, and he also complimented the Branch upon its choice. He knew that the Branch could not be in better hands than those of the gentlemen who had been chosen to guide it during the year, he also expressed his pleasure that the Secretary had decided to remain in that arduous position for a further period. He now had great pleasure in calling upon the new chairman.

Mr. Philip, in taking the chair, thanked the members for the great honour shewn him in electing him to the very important position of Chairman of the Branch, which was second to none in importance. He wished to propose a very hearty vote of thanks to Mr. Marriott and his fellows on the executive, for the very able manner in which they had conducted the Branch during the past twelve months. The proposal was carried after other members had also added their mede of praise, and was replied to in a few words by the retiring Chairman and Secretary.

Vancouver Branch

P. H. Buchan, A.M.E.I.C., Secretary-Treasurer.

H. Rindall, M.E.I.C., district engineer of the Canadian Pacific Railway at Vancouver, B.C., has been loaned to the City of New Westminster for a week to make an independent report on the problem of rebuilding the pipe-lines which supply the New Westminster waterworks from Lake Coquitlam.

During the abnormal rainfall accompanying the storms of the last week in October, the Coquitlam river overflowed, and carried away approximately two miles of both pipe-lines. The destruction was complete and necessitated the rebuilding of the washed-out portions involving heavy expenditure which the city is having considerable difficulty in financing. In the meantime the water situation is serious, even though the neighbouring municipalities have been rendering every assistance in their power, at considerable voluntary inconvenience to their residents. The problem as yet does not appear to have met with a satisfactory solution either from an engineering or financial standpoint; hence the report of Mr. Rindall will be received with no little interest by the public and the engineering profession.

Calgary Branch

Arthur L. Ford, M.E.I.C., Secretary-Treasurer.
Floyd K. Beach, A.M.E.I.C., Branch News Editor.

Annual Banquet

The annual banquet held on December 30th at the Board of Trade was a function which has rarely been equalled in the history of the Branch. Teamwork on the part of the executive and programme committees and a number of other members may be given the credit for its success.

The menu and toast list, appearing as blue prints neatly tied in blue ribbon, were prepared by W. J. Gale, A.M.E.I.C. B. L. Thorne, M.E.I.C., chairman, called on George W. Craig, M.E.I.C., to act as toastmaster, and after the toast to the king was drunk, the following toasts were heard.

The veteran engineer, proposed by V. Meek A.M.E.I.C., acting commissioner of irrigation, and responded to by Lewis Stockett, M.E.I.C.

The civil engineer, proposed by R. S. Trowsdale, A.M.E.I.C., and responded to by J. A. Spreckley, A.M.E.I.C., and by R. S. L. Wilson, A.M.E.I.C., professor of civil engineering at the University of Alberta.

The mechanical engineer, proposed by L. F. Fyles, A.M.E.I.C., and responded to by J. F. McCall, A.M.E.I.C.

The mining engineer, proposed by A. Griffin, M. Am. Soc. C. E., and responded to by B. L. Thorne, M.E.I.C.

The electrical engineer, proposed by A. S. Chapman, A.M.E.I.C., and responded to by H. J. McEwen, A.M.E.I.C., and by R. B. Baxter, of the Alberta Telephones, a councillor of the Alberta Association of Professional engineers.

The prospective engineer, proposed by P. Turner Bone, M.E.I.C., and responded to by Stuart Dawson, student at the University of Alberta and a son of A. S. Dawson, M.E.I.C.

Angus Smith, M.E.I.C., newly elected commissioner of the city of Calgary thanked the engineers for the support they gave him recently when he was elected to a very important post in the city.

Our guests, proposed by B. L. Thorne, M.E.I.C., and responded to by P. L. Naismith, manager of the Canadian Pacific Railway department of natural resources.

Interspersed with the toasts were songs by G. H. Patrick, A.M.E.I.C., W. J. Gale, A.M.E.I.C., and others, and popular songs by the gathering led by A. S. Chapman, A.M.E.I.C.

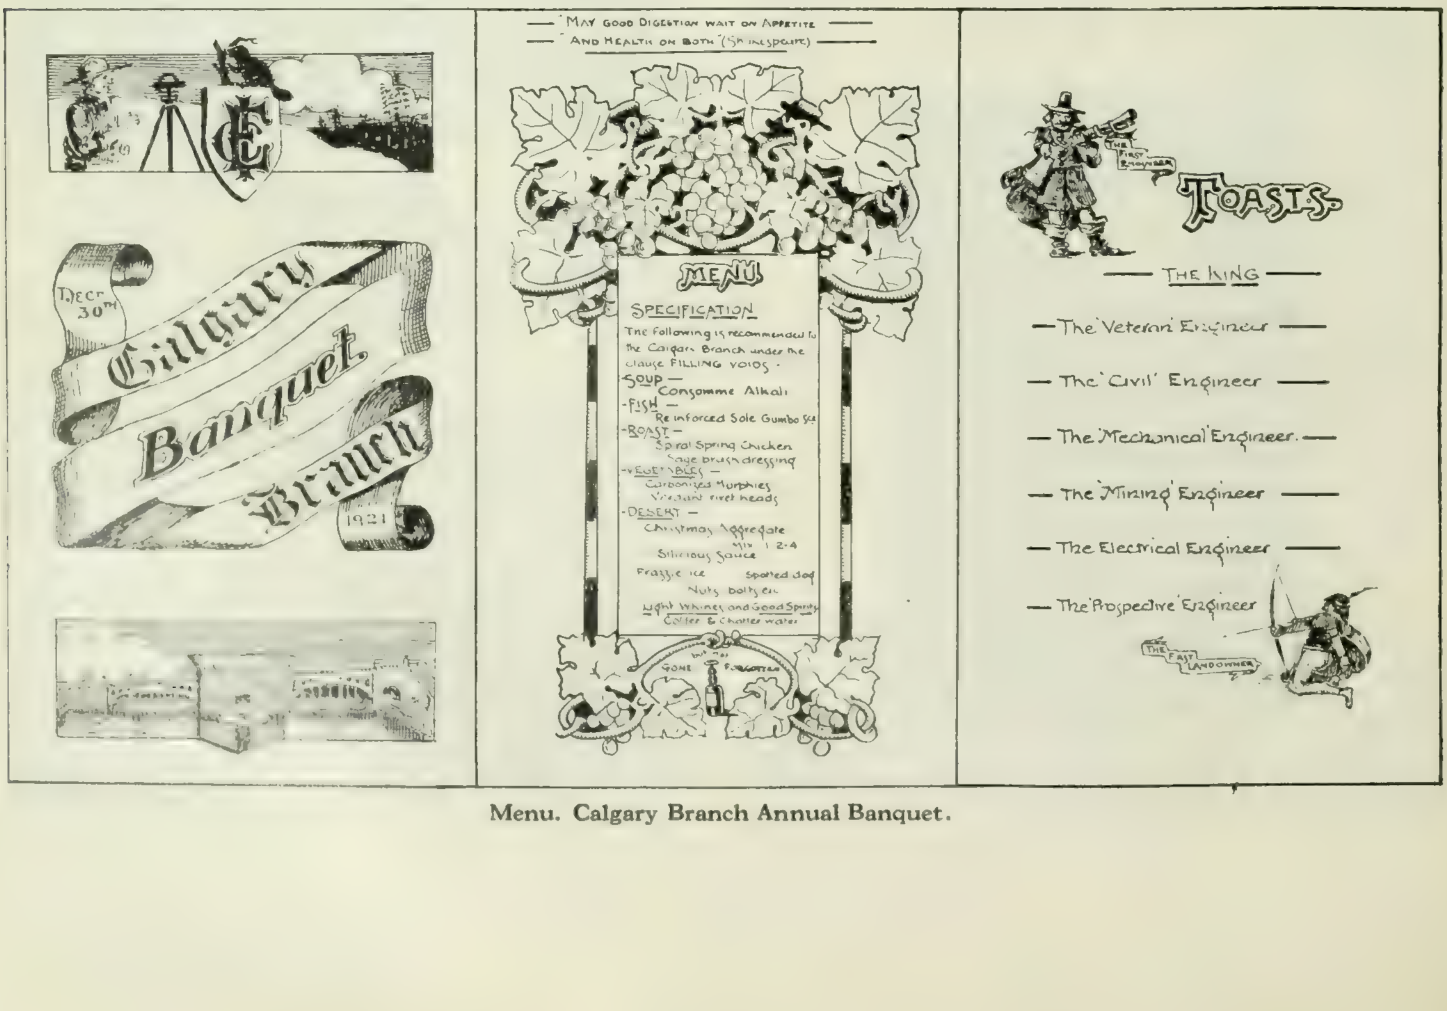
With such a toast list it is possible to touch on only a few of the many valuable remarks. The whole sense of the meetings was an appreciation of the place in our social fabric occupied by the engineer — not merely the civil engineer, but by engineers of all kinds.

A number of outsiders were specially invited, among them a number of students in the University of Alberta, and the toasts and their responses gave the visitors an outline of the aims and aspirations of *The Institute*.

The Institute so recently ceased to be merely a society of civil engineers and widened its scope to include all branches that many still have too narrow a view of its activities, and the banquet assisted materially in spreading the idea of its present breadth of outlook.

The tribute paid to the civil engineer by R. S. Trowsdale was to the point. Coming from a mechanical and electrical man of high standing in his branches, it was a valued appreciation. He cited as an example of the achievements of this branch of engineering, the Queenston Chippawa hydro-electric project, which while calling for great talent in mechanical and electrical lines, would have been impossible without the talent of the civil engineer.

Professor Wilson in replying spoke of the training of the civil engineer and pointed out that he could hope to turn out a man with a mere ground work for his calling. The real engineer must follow only after some years of application of the underlying principles taught in college.



Menu. Calgary Branch Annual Banquet.

B.L. Thorne, M.E.I.C. touched on some of the problems to be met by the mining engineer in Alberta. Among them is the difficult problem to be solved if platinum is to be recovered from the Red Deer river, owing to the small part by weight or size contained in the raw ore.

R. B. Baxter spoke very ably on some recent achievements in telephone communication in the province, including automatic dialing from the Calgary office to any subscriber in Edmonton or Lethbridge and vice versa as well as from a number of minor offices in the province; of carrier lines which permit four telephone conversations and sixteen telegraph messages on one copper circuit between Calgary and Edmonton at one time, and he forecasted the achievements that are to be demanded of the telephone engineer in the near future.

Stuart Dawson in replying to the toast to the prospective engineer spoke both ably and modestly. One feature, very well put, was that most of the engineering students graduate without knowing much of the activities of *The Institute* and if addressed during their student days on the aims of *The Institute*, a large number of them could be enrolled as student members to the mutual benefit of themselves and *The Institute*.

The Branch was highly honoured in the presence of P. L. Naismith, M.E.I.C. and he paid glowing tributes to the efforts of the engineer. One of the charter members of *The Institute*, Mr. Naismith joined as a student member on the formation of the Canadian Society of Civil Engineers, while a student at McGill. After graduation, he went to the United States for several years and let his membership lapse, but because of his early association, he has always felt kindly toward the members of the profession, and in his career, which has largely been one of an executive character, he has had much to do with engineers of all branches of the profession and esteems them very highly. In touching on the calibre of the men who were the founders of the original Society, Mr. Naismith pointed out some of the illustrious names that adorn the charter roll and he called on the present members to live up to the standards set by them.

On January 6th, Captain C. J. McKenzie, M.C., A.M.E.I.C., addressed the Branch on "Developments in Sanitary Engineering," giving a very carefully prepared paper which is being submitted to *The Journal* for publication.

His treatment of this very important subject was most thorough considering the limitations imposed by time for a single lecture, and much discussion was provoked

Montana Irrigation and Drainage Institute Convention

The third annual conference of the Montana Irrigation and Drainage Institute was held at Great Falls, Montana, On December 8 to 10. The convention was an outstanding success. A large number of delegates were present representing many of the irrigation projects of the state, the U. S. reclamation service, and various agricultural and educational institutions. Among the members of *The Institute* present from the Province of Alberta were:—

William Pearce, M.E.I.C., Dept. of Natural Resources, C. P. R.

A. S. Dawson, M.E.I.C., chief engineer, C. P. R., Dept. of Natural Resources.

V. Meek, A.M.E.I.C., acting commissioner of irrigation, Dominion Government.

Major H. B. Muckleston, M.E.I.C., chief engineer, Lethbridge Northern Irrigation District.

R. S. Stockton, M.E.I.C., Supt. operation and maintenance, C. P. R. Dept. of Natural Resources.

The object of this Institute is to advance knowledge pertaining to irrigation and drainage and to encourage improvement in irrigation practice and a more complete use of the water resources of the state of Montana. Many excellent addresses were delivered, and a number of irrigation and drainage problems fully discussed. One of the most interesting subjects dealt with was colonization on both dry and irrigated lands. This is one of the important problems facing the Province of Alberta at the present time. E. F. Benson, chief colonization agent of the Northern Pacific Railway, opened the discussion on this subject with a very able address. Mr. Benson stated that among settlers on new land the number of failures averaged 50%, largely because new settlers were obtained by nothing more nor less than land selling schemes. State supervision was advocated and the formation of some organization to assist the land settler both financially and educationally, also lower land prices with the terms of payment spread over a long period.

At the close of the convention, William Pearce who was called "The Grandfather of Irrigation in Montana and Alberta" was appointed an Honorary Life Member of the Institute.

Winnipeg Branch

Geo. L. Guy, M.E.I.C., Secretary-Treasurer.

E. V. Caton, A.M.E.I.C., Branch News Editor.

On Friday, the 19th. January, the annual meeting of the Association of Professional Engineers of the Province of Manitoba was held in the University Building.

The Secretary's report and reports of Committees were presented and approved. The Secretary's report showed a most satisfactory condition of the Association; there are 288 members of the Association and 21 applications are pending. The Library Committee reported on progress in the organizing of a technical library for use of members, 100 books already having been purchased.

Letters of appreciation and thanks were received from the University Faculty and Undergraduates' Association, thanking the Association for their offer of an annual scholarship.

Election of officers to replace those retiring resulted in the election to Council of:—

Messrs. George L. Guy, M.E.I.C.,
E. P. Fetherstonhaugh, M.E.I.C.,
A. A. Young, A.M.E.I.C.,
E. V. Caton, M.E.I.C.,

which together with the sitting members:—

Messrs. W. M. Scott, M.E.I.C.,
D. A. Ross, M.E.I.C.,
H. A. Dixon, A.M.E.I.C.,

constitute the Council for the ensuing year. The Council elected Messrs. D. A. Ross, M.E.I.C., President, A. A. Young, M.E.I.C., Vice-President, and George L. Guy, M.E.I.C., Secretary-Treasurer and Registrar.

Border Cities Branch

J. Clark Keith, A.M.E.I.C., Secretary-Treasurer.

The first meeting of the Executive for 1922 was held on December 21st when the following committees were appointed for the year:—

Papers and Entertainment:—
F. H. Kester, A.M.E.I.C., Chairman.
E. J. McIntyre, A.M.E.I.C.
W. J. Fletcher, A.M.E.I.C.

Membership:—
J. E. Porter, A.M.E.I.C., Chairman.
D. A. Molitor, M.E.I.C.
M. E. Brian, A.M.E.I.C.

Advertising:—
L. E. Collins, Jr.E.I.C.

Nominating:—
H. Thorne, M.E.I.C.

J. J. Newman, M.E.I.C., is the Branch Representative on the Ontario Provincial division.

The opening meeting for this year was held in the Cadillac Cafe on Friday, January the thirteenth, Chairman Geo. F. Porter, L.L.D., M.E.I.C., presiding.

All present participated in the opening exercises — a substantial dinner — and twenty-five plates were cleared with the proficiency peculiar to the profession.

The desirability of changing the night of meeting was discussed and the Secretary was instructed to send a questionnaire to each member to secure an expression of opinion from the entire Branch.

On behalf of the retiring Executive, M. E. Brian, A.M.E.I.C., presented J. E. Porter, A.M.E.I.C., past Secretary, with a memento in appreciation of the service he had rendered to the Branch during the past two years.

Engineering Legislation was discussed and the policy to be followed was placed in the hands of the Executive Committee in co-operation with J. J. Newman, M.E.I.C., Ontario Provincial Division Representative.

W. H. Baltzell, M.E.I.C., chief engineer of the Canadian Steel Corporation, addressed the meeting on the manufacture of T.N.T. The speaker kept his address remarkably free from the technical chemical phrases which would ordinarily be involved in such a paper. He dealt with its manufacture from the original source of toluol from the balsam of tolu but now obtained as a by-product from coke ovens, to its final rectification with alcohol and its packing in paper lined wooden kegs ready for shipment. By means of charts the progressive stages of manufacture of T.N.T., the sulphonation of benzine, synthetic phenol fusion and the manufacture of picric acid were clearly shown. Very interesting comparisons were drawn in the total quantity of ammunition used in the American Civil War and in single battles in the battle area in France. The destructive effects of aerial bombs and long range guns were clearly presented. The amount of high explosives manufactured in the U. S. for commercial purposes in 1909 was about one half the quantity used by Great Britain during four years of war.

D. A. Molitor, M.E.I.C., contributed further to a profitable evening by giving the Branch a paper on "The Evolution of Matter in the light of Modern Science". It has seldom been the privilege of the members to listen to a more interesting paper. It dealt with a subject, ultra-scientific in its nature, delving into the realms of probability on the formation of elements and compounds from the protyle, which antedated the nebulae, to the present time. The time for the formation of various elements and compounds ranged from billions of years to a matter of minutes. An explanation was sought for the beginning and end of all things and the conclusion drawn by the speaker was that the primal form of matter was not created but that "it always was and never can be destroyed, there was no beginning and there is no end".

Both papers were thoroughly enjoyed and a hearty vote of thanks was tendered by the Chairman.

Much interest will be created in engineering circles in the Border Cities by the announcement that borings for the Windsor-Detroit Bridge piers will be commenced immediately.

Local News

On December 29th, to Mr. and Mrs. J. E. Porter — a son. Congratulations.

London Branch

Geo. C. Wright, A.M.E.I.C., Secretary-Treasurer.

O. L. Olmsted, A.M.E.I.C., Branch News Editor.

On December 21st, a regular meeting was held at which fifteen members were present. By-Laws as amended were adopted and the nominating committee elected as follows:—H. B. R. Craig M. E. I. C. was appointed representative, following the receipt of his report of the meeting of the Ontario Division.

The Secretary of the Branch was authorized to attend the Annual Meeting in January 1922, and in this connection the suggestion of the Montreal Branch Secretary regarding a meeting of Branch Secretaries was approved.

At a meeting held on Jan. 20th, the following officers were elected for the forthcoming season:—

Hon. Chairman,	Dr. J. Davis Barnett, M.E.I.C.
Chairman,	H. A. Brazier, M.E.I.C.
Vice-Chairman,	W. J. Forbes-Mitchel, M.E.I.C.
Secretary-Treasurer,	Geo. C. Wright, A.M.E.I.C.
Executive Commitee,	F. A Bell, A.M.E.I.C., Chas. Talbot, A.M.E.I.C., H. B. R.Craig, M.E.I.C.

Hamilton Branch

W. F. McLaren, M.E.I.C., Secretary-Treasurer.

Detroit-Windsor Bridge

The meeting held on January 13th in the Conservatory of Music Hall was addressed by Professor C. R. Young, M.E.I.C., member of the Advisory Board of Consulting Engineers for the Detroit-Windsor Bridge, on the engineering features of this project. E. H. Darling, M.E.I.C., Chairman of the Branch, presided.

Professor Young in introducing the subject traced the development of the present bridge project, pointing out that efforts had been made for the last 30 years to construct a bridge across the Detroit river, but without success until the present undertaking was inaugurated. Several of the previous schemes had been based on the crossing of the river between Ouelette Avenue, Windsor and Woodward Avenue, Detroit, but Charles Evan Fowler, M.E.I.C., who had been called in by a group of business men of the two cities in the summer of 1919 had shown this crossing to be financially impracticable and had proposed the crossing of the river at a narrower point lower down. The economic practicability of this gave a spur to the project, resulting in necessary legislation being secured at Ottawa and Washington and in the formation of the American Transit Co., and the Canadian Transit Co., to undertake the work jointly. Mr. Fowler, who had developed the essential features of the design for a wire cable suspension bridge of 1803 ft. central span by this time, asked that an Advisory Board of Consulting Engineers be established to pass upon the preliminary design and on other points of design and construction as they might arise throughout the work. This board, of which Mr. Fowler is chairman and chief engineer, consists of George H. Pegram, chief engineer, Interborough Rapid Transit Co., New York; Professor Wm. H. Burr, consulting engineer, New York; Lieut.-Colonel C. N. Monsarrat, M.E.I.C., formerly Chairman of the Board of Engineers of the Quebec Bridge and Professor C. R. Young, M.E.I.C., of the University of Toronto.

In referring to the economic basis for a bridge at this crossing, the speaker pointed out that a large increase in traffic might normally be expected within the next few years, in view of the very rapid rate of increase in population of Detroit and the Border Cities. It is a well known fact, he said, that traffic normally increases at a much more rapid rate than population. Thus, steam railway traffic for Canada from 1901 to 1919 increased, so far as passengers are concerned, over twice as fast as the population, whereas, in the matter of freight, it increased over three times as fast. The electric railway traffic during the same period increased eight times as fast as the population. For the United States, during this period, the steam railway passenger traffic increased five times as fast as the population and the freight traffic four times as fast. The vehicular traffic across the East River Bridges at New York city increased from 1912 to 1919 over twelve times as fast as the population did for Greater New York, although no additional facility had been provided during the period. The passenger ferry traffic across the Delaware River between Philadelphia and Camden between 1900 and 1920 increased over four times as fast as the population, while the vehicular traffic increased nearly four times as fast. Between San Francisco and the opposite cities of Oakland, Berkeley and Alameda, the passenger ferry traffic, despite the discouraging eight-mile trip, increased during the period between 1912 and 1920 over twice as fast as the population. With the provision of a new facility for crossing the Detroit river, the speaker asserted, the rate of increase of traffic, even though it must cross the international boundary, should be very large. As an instance of what happens when an attractive new traffic facility is offered, the speaker referred to Toronto-Hamilton Highway on which the vehicular traffic had increased from 1914 to 1920 by 1,520%.

Professor Young discussed in some detail the alternative types of structure that had been considered by Mr. Fowler in making his recommendation of a wire cable suspension bridge for this crossing. While the cantilever type possesses great rigidity, it is essentially uneconomical for the existing situation. An interesting corroboration of the results of the comparative study of the cantilever and suspension types has occurred, said the speaker, in the publication of the report of the Board of Engineers for the Philadelphia-Camden bridge. Very careful comparative estimates have shown for that structure the cantilever type would cost over 7% more than the suspension type. Other disadvantages of the cantilever for the Detroit-Windsor crossings are that a longer span would be necessary for it than for a suspension bridge to obtain the same clear waterway with a minimum height of 110 ft. at the harbor lines, the curvature necessary on the Detroit approaches beginning with the main piers could not be obtained, and the constructing of a highway bridge which might later be transformed into a combined highway and railway bridge would be impossible.

While the arch type had appealed very much to Mr. Fowler in his original studies, he had not felt like taking the chance of recommending its adoption for a span so much greater than any that had actually been built heretofore. The Fidler, or am Ende, type of three-hinged arch actually works out to be a very economical structure, but the hazards of erection and the absolute necessity of having rock foundations had rendered its adoption inadvisable.

The speaker described, with the aid of many slides, the various forms of suspension bridges to which consideration had been given. Because of the necessity for a curved approach on the Detroit side, it was necessary to employ a structure with unloaded back stays, and this incidentally contributed to the rigidity of the main span. Two-hinged stiffening trusses are proposed in preference to three-hinged ones, because of greater rigidity, and pivoted towers have been adopted so as to obviate the large bending moment with towers fixed to the masonry. The weight of these hinged towers had actually worked out to be less than half that of fixed towers. The articulated anchorage proposed for this structure was described by the speaker as a most economical type of construction where rock foundations are available.

Full justification for the adoption of wire cables as against braced eye-bar cables was given by the speaker. He pointed out that as eye-bar cables would weigh nearly

three times as much as wire cables to carry the same stress and the pound price erected of such cables would probably not be less than three-fourths of that for wire cables, eyebar cables themselves would cost much more than those of wire and would impose a heavier load on the towers, piers and anchorages. The uncertainty concerning the erection of such cables which had not been employed on any structure with a span having a greater length than about half of that of the Detroit-Windsor bridge ruled out cables of this type.

Discussing details of the design, Professor Young explained the factors that had governed the adoption of the cross section, instancing the experience of those in charge of the East river bridges of New York with respect to the value of roadways with various numbers of lanes of traffic. He discussed the relation of the adopted loadings to the working stresses comparing them with loadings and stresses adopted for similar long span bridges.

Discussion of the address followed, in which E. H. Darling, M.E.I.C., Chairman of the Branch, R. K. Palmer, M.E.I.C., chief engineer of the Hamilton Bridge Works Co. Ltd., and F. W. Paulin, A.M.E.I.C., vice-president and manager of the Canadian Engineering and Constructing Co., took part.

Toronto Branch

F. B. Goedike, M.E.I.C., Secretary-Treasurer.

C. R. Young, M.E.I.C., Branch News Editor.

Highway Construction in Ontario

The first meeting of the Toronto Branch after the holidays was held on January 12, when Hon. F. C. Biggs, minister of public works and highways, Ontario, and Geo. Hogarth, M.E.I.C., chief engineer of highways, spoke on highway development in Ontario.

Hon. Mr. Biggs in addressing the meeting confined his attention to a discussion of the policy which was being developed by the Ontario government in the matter of highway development. He described the difficulties experienced twenty years ago by those who were endeavouring to create good road sentiment in the province. Although the "Highway Improvement Act" had established an advantageous system of aid for municipalities wishing to improve their roads, there were many cases of by-laws submitted for the purpose of undertaking good roads work defeated at the polls.

A strong effort is now being made, said Hon. Mr. Biggs, to reconstruct the important roads to carry the heavier and denser traffic that now exists. Primary attention is given to the problem of drainage and subbase, although the public is not aware of the wisdom of this plan, and clamors for a hard-surfaced road at once. There are now about one hundred miles of highway in the provincial system about to the point where hard surfacing can be provided and credit thus derived for the work already done. The minister expressed the hope that the construction record of seventy-five miles during 1921 would be exceeded in 1922.

The speaker paid a tribute to the services of engineers in the work of his department, and reminded his hearers that he had been instrumental in having a measure put through the House whereby all county road superintendents must be graduate engineers. He outlined the system of organization maintained in the department for handling the 1800 miles of provincial highway.

Matters of importance requiring attention, according to the minister, include the separation of grades at dangerous level crossings and the carrying of lights on all vehicles at night. The possibility of legislation on the latter question was pointed out.

The value of good roads in maintaining an equable market for perishable products was stressed by the Hon. Mr. Biggs. It now happens that producers, in order to avoid the muddy season, force perishable commodities on the market too early, thus congesting it and creating a period of scarcity at the time when normally such products would be plentiful. He looked forward to the time when Niagara fruit would be laid down in Toronto by motor the morning after it was picked. The economic range of the motor vehicle, said Hon. Mr. Biggs, is about one hundred miles, whereas with the horse-drawn vehicle it is only eight or ten miles. He was of the opinion that in the next ten years freight would be handled very commonly by motor truck for distances of fifty or sixty miles.

Mr. Hogarth confined his address to the methods of construction of the provincial highways. Cross-sections of typical roadways were displayed by lantern slides and many excellent views of roadways, both before and after reconstruction, were exhibited. The equipment and methods of placing the material as well as the side drainage and elimination of sharp curves and heavy grades were fully discussed. Previous to the meeting, Hon. Mr. Biggs, W. A. McLean, M.E.I.C., deputy minister of highways, and Mr. Hogarth were entertained at dinner by the Executive of the Branch.

At the meeting of the Executive held the same evening, the Chairman and Secretary of the Branch were appointed to attend the annual meeting of *The Institute* in Montreal, on January 24-25.

Revision of Branch By-Laws

At the meeting on January 19, J. M. Oxley, M.E.I.C., Chairman of the Branch Committee on by-laws, gave notice that he would move at the next regular meeting of the Branch that certain amendments to the by-laws be made. These, he explained, were necessitated generally by the present policy of ending the winter session about the middle of March. As a result, the date of the annual meeting provided in the existing by-laws, and other dates depending thereupon, required to be changed. An informal preliminary discussion of the proposed changes took place, in which A. H. Harkness, M.E.I.C., R. O. Wynne-Roberts, M.E.I.C., Wm. Storrie, M.E.I.C., F. B. Goedike, A.M.E.I.C., C. R. Young, M.E.I.C., and others took part.

Construction Industry in Canada

Following the discussion of by-laws, H. W. Pepper of the MacLean Building Reports, Ltd., addressed the

Branch on the condition of the construction industry in Ontario, illustrating his remarks by a large chart showing the variation of the volume of construction from 1910 to 1921. According to the speaker, the construction industry ranks above any other in Canada, except agriculture, and is the greatest single industry in terms of the amount of labour employed. He stated that because of the high cost of materials and labour, there was now a deferred volume of construction amounting to one and one-quarter billion dollars which would, sooner or later, have to be overtaken. The excellent technical position in which the construction industry now found itself, said Mr. Pepper, was bound to result in great activity, once public confidence is restored. That this activity has shown signs of arrival is indicated by the fact that the volume of construction for December, 1921, is over double the amount for the same month in any of the preceding three years.

Mr. Pepper discussed at length the trend of prices of construction materials and of common labour, pointing out that labour was only about 10% under its peak price for 1920, whereas materials were off about 50%.

J. M. Oxley, M.E.I.C., supplemented the address of Mr. Pepper by exhibiting a chart showing the variation of the Engineering News-Record construction cost index from 1913-21, the variation of wages for common labour and the variation of the cost of living for the same period. It was pointed out by Mr. Oxley that labour is now obtaining in terms of the cost of living one and one-half times that which it obtained in 1913.

On account of the illness of the Chairman of the Branch, Wm. Storrie, M.E.I.C., Vice-Chairman, presided at the meeting.

At the Executive meeting held prior to the general meeting, the report of the Library Committee was received, and a grant of $125. made for purposes of carrying out necessary extensions to the library.

Ottawa Branch

F. C. C. Lynch, Associate E.I.C., Secretary-Treasurer.

The close of a year of exceptionally satisfactory results was celebrated on the evening of the 12th January by a gathering of about 100 members of the Ottawa Branch of *The Engineering Institute of Canada*, the occasion being the Annual meeting of the Branch. Lieut.-Commander C. P. Edwards, M.E.I.C., the retiring Chairman, presided and presented a report which was received with many expressions of appreciation. Commander Edwards stated that the Branch had held four luncheons and twelve evening meetings during 1921, and that among those who addressed the meetings were Senator Robertson, Hume Cronyn, ex-M.P., and J. M. R. Fairbairn, M.E.I.C., President of *The Engineering Institute of Canada.*

The report further showed the impetus and support which the question of legislation to protect the public and the engineer had received and emphasized the need of consistent effort to bring all provinces in line. The success of the first year of the Professional Institute of Civil Servants was a reminder of the useful part played by many engineers in the Government Service in the growing and useful organization.

From the financial standpoint, the situation of the Branch was shown to be sound and healthy, the treasurer's report showing a substantial balance. The membership has been well sustained, forty-one new members having been accepted during the year.

The Chairman's remarks regarding the valuable assistance rendered by the local press in regularly and faithfully reporting the activities of the Branch during the year were unanimously endorsed by the members, and a motion was adopted thanking The Ottawa Journal and The Citizen for courteously opening their columns for this purpose. Appreciation was also expressed of the courtesy of Dr. William McInnes, Director of the Victoria Memorial Museum, for the use of the hall in that building, and to R. S. Peck, Director Exhibits and Publicity Bureau, Dept. of Trade and Commerce and Mr. J. B. Harkin, Commissioner of Dominion Parks, Dept. of the Interior, for valuable assistance in making the evening meetings successful by the use of motion pictures.

The officers elected for the coming year were as follows:—

Chairman, K. M. Cameron, M.E.I.C., assistant chief engineer, Dept. of Public Works; Secretary-Treasurer, F. C. C. Lynch, Associate E.I.C., superintendent, Natural Resources Intelligence Branch, Dept. of the Interior; Executive Committee:—O. S. Finnie, M.E.I.C., director, Northwest Territories Branch, Dept. of Interior; A. Ferguson, M.E.I.C., assistant chief engineer, Highways Branch, Dept. of Railways and Canals; A. B. Lambe, A.M.E.I.C., engineer, Dominion Power Board, Dept. of the Interior; C. McL. Pitts, A.M.E.I.C., engineer, Pitts Construction Company; J. L. Rannie, A.M.E.I.C., supervisor of triangulation, Geodetic Survey of Canada.

The new Chairman in outlining the activities for the ensuing year announced the "Engineers' Ball" which is to take place at the Chateau Laurier on the 26th January under the distinguished patronage of the Governor-General and Lady Byng of Vimy; also the following lectures and addresses:—

Geo. Hogarth, M.E.I.C., chief engineer, Provincial Department of Highways, Toronto, on "Good Roads"; R. J. Durley, M.E.I.C., Secretary, Canadian Engineering Standards Association, on "Standards"; Major D. H. Nelles, M.E.I.C., on "Canadian Forestry Corps in France; Col. H. C. Boyden, of Chicago, on "Concrete"; and other interesting items. The semi-technical lectures, as usual, will be illustrated by moving pictures and lantern slides and the general public will be invited to attend.

Geo. A. Mountain, M.E.I.C., chief engineer of the Board of Railway Commissioners, moved a vote of thanks to the retiring Chairman and on behalf of the Branch presented him with a large gold watch and chain which was an excellent representation of the real thing and for which Commander Edwards thanked the Branch in a few well chosen words.

On the conclusion of the regular business the meeting took the form of an entertainment, including singing, lantern slides, cartoons and two reels of motion pictures, after which refreshments were served.

President Fairbairn goes to Ottawa

Smoker

The "Smoker" was run off on schedule on January 15th, in the Palm Room of the Chateau Laurier; 225 tickets were printed and 240 engineers were packed into the room — then a "standing room only" sign was hung outside the door.

The arrangements were in charge of a committee under K. M. Cameron, M.E.I.C., assistant chief engineer of public works, and Lieut.-Commander C. P. Edwards, M.E.I.C., Chairman of the Branch, acted as Chairman in his usual happy manner.

As described in the local press, "Music and song, farce, comedy and caricatures, with a bounteous repast, all went to provide a delightful evening."

Jules Brazil, the famous Toronto entertainer, was brought specially to Ottawa for the evening and proved as pleasing and inimitable as ever. His ability to conduct community singing raised the enthusiasm of even the "refrigerating engineers" and the climax was reached when he called upon Commander Edwards to sing a song, and followed up with G. Gordon Gale, M.E.I.C., vice-president of the Hull Electric Company, and then George Mountain, M.E.I.C., chief engineer, Railway Commission.

Edwards' efforts were received with applause, Gale's with a roar, while Mr. Mountain's brought down the house with a regular ovation.

By way of variety, a one act comedy was put on by the Ottawa Drama League, entitled "Suppressed Desires," the players taking part being Miss Edith Gardner, Mrs. Louis White and W. D. Cromarty. The acting was excellent and was received with much approbation.

Local interest was provided by George Phillips, A.M.E.I.C., Inspecting engineer of the Naval Service, who sang the "Engineers' Song" and as each verse extolling, the virtues of each brand of engineer was sung, lantern slides of local celebrities in cartoon were put on the screen. It was afterwards voted that Burton Burney's reproduction of Gordon Gale, with his "service at cost" and decrepit horse, vying with Mr. George Mountain's song, was the hit of the evening.

Jef. Chapleau's slides of the evolution of the engineer, particularly the phases of "hydraulic" and "sewage disposal," were received with a roar, while the film

G. Gordon Gale in a thoughtful mood,

produced by our esteemed friend Ben Norrish, entitled "The Dancing Dusky Belles," was everything that the name implies.

It was necessary to cut short the entertainment at 11 o'clock, when an excellent supper was served in the main dining room, and all agreed that "a pleasant time was spent by one and all."

The Branch took advantage of this opportunity to entertain people of prominence, among them being Fraser S. Keith, Ben Norrish and A. McAllister, of Montreal, J. B. Hunter, Deputy Minister of Public Works, Charles Camsell, Deputy Minister of Mines, Dr. D. J. McLean, Dominion Railway Commissioner, and a few others.

The stage manager were Clarence Pitts, who under the title of "Chief Bohunk" conducted his Department with efficiency and considerable noise.

The Branch was particularly pleased to have with them Fraser S. Keith of Headquarters, and a cordial invitation is extended to him to visit us more frequently.

Montreal Branch

J. L. Busfield, A.M.E.I.C., Secretary-Treasurer.

Modern Telephone System

The 1922 season started with a regular meeting on Thursday evening, January 5th, at which Norwood M. Lash, chief engineer of The Bell Telephone Company addressed the meeting on the complexities of the Modern Telephone System. J. A. Duchastel, M.E.I.C., the Chairman of the Branch presided. In the course of his address the speaker dealt with the subject of the long distance telephone system, stating that the open wire will soon be replaced by wires in cable to care for heavy demands. The actual productive talking time on long distance was also discussed, and it is said that the time is constantly being increased as a measure of economy and

operating efficiency improved, but each advance along these lines called for bigger expenditure on new equipment. Moving pictures were used to illustrate the address. The theme taken was that of a subscriber receiving a bill and feeling very angry at the extent of it. He then fell asleep in his chair and made a journey through his own end of the phone to the connecting link at central. The subscriber in his dream managed to get through the connection of his house to the cables and carried his messages underground through intricate works until he reached the central station where he found the operators all at work, taking and distributing calls from far and near. He searched for his own line and was shown it by the superintendent.

The Town Manager Plant

On Thursday, January 12th, a departure was made in the regular Branch meetings by having a paper presented in french, with a resumé in English. Henri Ortiz, town manager of Grand'Mere Que., was the speaker, taking as his subject The Town Manager Plan. J. H. Hunter, A.M.E.I.C., presided. During the course of his address Mr. Ortiz dealt in a masterly way with the advantages of the Town Manager Plan, and explained in detail the workings of this system. He also explained how this method of City Management had grown within the last few years. Following his address, he exhibited a series of lantern slides showing the Town of Grand'Mere, and also by means of a moving picture film indicated to the audience ce the main features of the town and the surrounding country.

Explosives, and Steam by Electricity

On Thursday evening, January 19th, a joint meeting was held with the Montreal sections of the Society of Chemical Industry and of the Canadian Institute of Mining and Metallurgy. The meeting was presided over by W. G. Matheson, John T. Farmer, M.E.I.C., and Sir Stopford Brunton, A.M.E.I.C., representing the Society of Chemical Industry, *The Engineering Institute of Canada*, and the Mining Institute respectively. The meeting was held in the Queen's Hotel and preceded by a dinner, which gave the members of the different Societies an excellent opportunity of becoming acquainted. Following the dinner, Lieut.-Col. G. Ogilvie of Ottawa, chief inspector of explosives, read a paper describing the operations of the Explosive Act of Canada, following which F. T. Kalein, M.E.I.C., read a paper, illustrated by lantern slides, describing the methods of generation of steam by electricity. It is expected that this paper will be published in *The Engineering Journal.*

Quebec Branch

Hector Cimon, A.M.E.I.C., Secretary-Treasurer.

A luncheon-meeting was held at the Chateau Frontenac, on Monday the 9th of January 1922, presided over by the Chairman, A. R. Décary, M.E.I.C., and attended by 63 out of a Quebec membership of 90.

Mr. Décary, after greeting the members present at the meeting and expressing his pleasure at the large number of the members of the Quebec Branch present, said it had been decided that there should be two meetings held every month during year, at which papers would be read, and at this initial meeting, O. H. Côté, A.M.E.I.C., industrial commissioner for the Quebec Board of Trade would read a paper dealing with "The Shipbuilding Industry at Quebec, in the Last Century". He introduced Mr. Côté who spoke in French and dealt at length on the construction of wooden ships of the past which gave employment to thousands of Quebec workmen, until James Watt, by his invention, gave a death blow to sailing ships.

Mr. Côté said that the first to advocate the construction of ships in Canada was Samuel de Champlain, but it was the celebrated Intendant Talon who first started to develop this industry. He quoted from the King's expense account for the year 1671 an item regarding shipbuilding and the expenditure of 40.000 livres to be used for that industry in Canada. He then went into details of shipbuilding that followed and quoted from the late James Lemoine, in his book "Quebec, Past and Present," which records that the first ship built in Quebec to cross the ocean was modelled on the shore of the Rivière Saint Charles in the year 1703.

From information gathered in 1722, ships of a fairly good tonnage were launched in the St. Charles River from a place which was designated on the map of the city, fifty years ago, under the name of "Marine Hospital Cove". It is also near this cove that, in 1825, the famous sailing ship called the "Baron of Renfrew", of 5294 tons, with one deck and four masts and over three hundred feet long was built.

It is claimed that the title of father of the industry of shipbuilding in Canada should be given without hesitation to the Intendant Hocquart, who occupied that important position in Canada from 1729 to 1748. He was well seconded in his enterprise by Abbé Louis Lepage de Ste-Claire, Seigneur de Terrebonne.

In 1730, Abbé Lepage addressed to the Intendant a long memorandum setting forth the advantages of the industry of shipbuilding in Canada. After elaborating a vast plan of naval construction, he offered to supply the wood necessary for the enterprise at a price 50% less than the King was paying for the same wood in France.

About 1740, more important constructions were started, "man of war" frigates carrying 26 to 30 guns were built. In 1748, it is noted from the registers that a Royal Shipyard existed at Quebec, with a construction engineer in charge and all the necessary workmen, directed by Sieur Levasseur.

From 1787 to 1797 there were 173 ships built, with a total tonnage of 13,056 tons, the total value of the production in the ten years being $525,000, a very important figure if we consider that the population of Quebec, in 1790, was 14,000 inhabitants.

In 1799, the first ship was built for the commercial trade in Quebec.

The most active period of the industry was from 1800 to 1900. From the registers of the time it is seen that 2,542 ships were built here between 1797 and 1896, that is during 100 years, with a total tonnage of 1,377,079 tons, which gives an average of 540 tons per ship, the smallest being 100 tons and the largest 5,294 tons. The total value of ships built in Quebec during the last century was $55,200,000, of which $16,535,000 represented the wages paid. From 1850 to 1875, an average of 48 ships per year were built in Quebec.

Mr. Côté concluded in saying that the industry of wooden shipbuilding in Quebec exists no longer; it is a thing of the past and the workingmen of Quebec have lost a principal source of revenue.

Alex. Fraser, A.M.E.I.C., Vice-Chairman of the Branch, then moved a vote of thanks to Mr. Côté which was unanimously carried.

Mr. Décary announced that it had been arranged that the speakers at the subsequent meetings would be alternately English and French, in keeping with the spirit of entente cordiale which always existed in the City of Quebec between the French and English speaking people. He also made other comments in the interest of the profession and the holding of the next Annual and Professional Meeting at Montreal. He again expressed his pleasure at the large attendance of the members of the profession at this first luncheon-meeting.

E. A. Evans, M.E.I.C., moved a vote of thanks to Mr. Décary for the able manner in which he had presided at the meeting, and his arrangements in carrying out of the same.

The company closed by singing O Canada and God Save the King.

The next meeting is to be held on the 30th of January, at 8 p.m.; the speaker will be R. H. Nisbet, chief of the Aviation Department of Price Brothers & Company, Limited, and his talk will deal with "Aviation and Its Use by Engineers".

Moncton Branch News

M. J. Murphy, A.M.E.I.C., Secretary-Treasurer.

The Moncton Branch of *The Engineering Institute of Canada* held its monthly dinner at the Happen Inn Tea Shop at 6 o'clock, Thursday evening, December 1st, 1921.

J. D. McBeath, M.E.I.C., presided and there were about forty present including the speaker of the evening. K. H. Smith; M.E.I.C., also Dr. J. A. L. Henderson, who at the meeting of the local Branch, lectured on Natural Gas; Dr. Fred. E. Burden and Prof. Wm. McKeil, of Mt. Allison University.

Immediately after the dinner an altogether delightful vocal solo, "Joggin' Along The Highway," was rendered by Mrs. Clyde Stevens and was heartily encored. Vincent Doucet, formerly of Bathurst, but now of this city, delighted the gathering with a violin solo, "Souvenir," and also was heartily encored. Major W. A. McKee accompanied both artists and afterward rendered on the piano, the new national song "Canada", recently from the pens of George Ross, Mus. Bac., A. R. C. O., and Dr. Fred E. Burden.

K. H. Smith, M.E.I.C., chief engineer of the Nova Scotia Power Commission, consulting engineer of the New Brunswick Electric Power Commission, gave a splendid lecture on Hydro-Electric Power. This lecture he illustrated with lantern slides. In beginning his address, Mr. Smith drew the attention of his audience to the fact that in the old days in the Maritime Provinces, when a man got a grant of land from the Government, it included the waterways; the newer or Western provinces profited by their experience and do not include the streams or lakes in their grant, which clause has assisted the people of the Western provinces a great deal in their development of Hydro-Electric power.

The Waterway Commission of the Department of the Interior has over fifty stations on different streams in the Maritime Provinces, where readings are taken every day of the water flow, and are reported daily to the central office. It is essential to collect data of stream flow over a long period of years on any waterway which promises a chance of hydro-electric development.

With aid of his lantern slides Mr. Smith showed the progress of the development from maps of the country surrounding the present developments where enormous water storage is to be had, along the line of progress showing the different plants in course of construction, the dams and huge pipes which store and carry to the plants and finally the plants themselves as they look when completed. He also showed some of the machinery and of the power lines which are now in operation.

Speaking of the powei that is propoced to bring to Moncton, he said that it would come from the Musquash plant and that a power line was being surveyed now from St. John up the Kennebecasis Valley to Moncton. It had not yet been definitely settled as to the horsepower it would carry, he stated.

The lecture was a very interesting and instructive one and showed conclusively what great advantages the country will derive from this new power.

A very hearty vote of thanks was moved by Mr. MacKenzie and seconded by Mr. Tisdale and presented to Mr. Smith by S. B. Wass, A.M.E.I.C.

A regular monthly meeting of the Branch was held in the City Hall on January 19th, 1921. S. B. Wass, A.M.E.I.C., Vice-Chairman, presided.

E. G. Evans, M.E.I.C., district engineer, Canadian National Railways, read a very interesting and instructive paper on the "Toredo Navalis" ("The Ship Worm"). Mr. Evans having spent considerable time in the study of this animal was well able to go into details on his subject.

By the use of lantern slides he was able to show in minute detail the destruction that this small animal had done to different wood structures that it came into contact with; also different views of the animal itself, especially the boring and cutting shell with which it enters the wood.

After considerable discussion by the members present, the Chairman extended Mr. Evans, on behalf of the Moncton Branch, a hearty vote of thanks for the manner in which he presented so instructive a paper.

Cape Breton Branch

Kenneth G. Cameron, A.M.E.I.C., Secretary-Treasurer.

A regular monthly meeting was held January 16th, in the rooms at the Bank of Commerce Building, Sydney. The business of the evening was a paper by R. M. Mackinnon, A.M.E.I.C., city engineer of Sydney, on the "Development of Sydney's Water Supply".

At that time the City Council were about to ask for authority by means of a plebiscite for an expenditure of $150,000 on the water system,—the work to be undertaken at this time in order to alleviate the unemployment situation. The paper, therefore, was of immediate public interest, and by the invitation of the executive several members of the City Council were present, and took part in the discussion. Unfortunately the attendance of members was rather small, giving the members of the City Council perhaps rather a wrong impression of our interest in civic affairs.

Mr. Mackinnon traced the history of the City's water supply from the earliest days, when Sydney's population was only 2,500, through the time of its increasing population, and the especial period which followed the "boom". This was the period during the establishment of the Dominion Iron and Steel Company's plant here, which caused very rapid growth. At this time the original reservoir became wholly inadequate, both in capacity and head, and it was necessary to seek a new source of supply. Accordingly in 1902 another site was chosen, further up the same valley. Work was begun in the early spring on laying water pipes, constructing dykes and a concrete core dam across the narrow gorge. The clearing of the ground was begun a little later, but a portion of the site was overlaid with peat to a depth in parts of seven feet, and owing to the pressing need of the new reservoir several pockets of this were allowed to remain. These later, in 1920, gave trouble. This new reservoir, with a capacity of 200 million gallons gave ample supply to the city, which at that time numbered 12,000, with a daily consumption of 62½ gallons per capita.

There was no indication of a shortage until 1908, when a dry summer reduced the water level to its lowest limit, and the need of further extensions was apparent. Several schemes were considered, and in 1912 a severe drought produced conditions demanding immediate action. Two large lakes lying further out were connected by open ditch, and the water pumped from the lower one over the divide to the existing reservoir. This work met all needs up to a recent date, but the steadily increasing population created such a demand that in 1920 a dry summer reduced the level of the water in the reservoir and occasioned further trouble. This developed from the peat pockets referred to above, and took the form of a very strong taste and smell of decayed vegetable and fishy character. Investigation and analysis, however, showed that while decidedly objectionable in this way, the water was not actually harmful, and treatment by dissolving copper sulphate, to the extent of ten pounds to the million gallons, removed the objectionable features in a week or ten days. At the same time attention was drawn to the necessity of removing the pockets, and the work under consideration at present, is that of providing a by-pass from the supply lakes direct to the distributing system, so that the reservoir may be emptied and properly cleaned.

One or two schemes have been suggested and Mr. Mackinnon outlined a further suggestion of his own, which he had recently submitted to the City Council, demonstrating his layout on a large scale plan of the system.

Considerable discussion followed the conclusion of Mr. Mackinnon's paper, in which the members of the City Council took part. On the motion of D. S. Morrison, A.M.E.I.C., seconded by K. H. Marsh, M.E.I.C., Mr. Mackinnon was given a very sincere vote of thanks.

Following the paper and discussion, a short business meeting was held, at which the Secretary outlined the proposed conference of Branch Secretaries, and asked that all members would give this matter serious consideration, in order that the best possible results might result therefrom. The conference had been heartily endorsed by the executive committee, who considered that such a meeting should do much to co-ordinate the efforts of the Branches and forward the interests of *The Institute.*

Town Planning Notes and Comments

Horace L. Seymour, A.M.E.I.C.

NOTE: — *In order to make this column of wide interest to members of The Institute, personals and items of town planning interest will be appreciated. Address: Horace L. Seymour, A.M.E.I.C., 40 Jarvis Street, Toronto.*

Education in Town Planning

To the students in the Social Service Course at McGill University, Messrs. Buckley and Cromarty of the Federal Town Planning Division, Ottawa, are lecturing on Housing and Town Planning.

The short course in Civics and Town Planning at Toronto University is now being held with a registration of some fifty members. These are from various places in Ontario, as well as from Toronto itself and besides students, practising architects, engineers and surveyors, there are several civic officials. The experiment seems assured of success and those attending seem well pleased with the opportunities afforded. During or after the lectures there is generally free and pertinent discussion. The course comes at an opportune time, as interest in town planning is being evidenced to a greater extent than ever before.

American Society of Civil Engineers

The writer received recently a notice of meetings of the American Society of Civil Engineers, New York

City, to be held early in January. The programme for the meetings indicates the interest that is being evidenced in that technical Society in the matter of Housing and Town Planning. The subjects were as follows:—

The National Housing Problem; Broad Economic Phases.
Planning and Zoning.
Utilities.
Legislation and Finance.

Nearly all those mentioned as taking part in the programme are men who have made their names in the Housing or Town Planning world.

It is encouraging to note that considerable interest in Town Planning is being evidenced in several of the Branches of *The Engineering Institute of Canada*, so that in this respect we are, at least, keeping up with our cousins across the border.

Town Planning in Salonika

In August, 1917, some of us probably remember that Salonika was totally destroyed by fire. At least, so few buildings remained that it was decided that they might be ignored in the preparation of a new plan. Here was an opportunity for the town planner to plan *de novo*. Apparently the opportunity has been well used.

In the "Town Planning Review" for December, 1921, there is found an article that deals with the Salonika Town Planning Act. The Greek Government appointed a commission of English and French Town Planning experts to prepare a town planning scheme, while a Town Planning Act and other legislation was drafted by a special commission. Important Town Planning legislation of other countries was reviewed in great detail, and recommendations were considered from various sources including the property owners. John W. Mawson, the writer of the article, who was town planning advisor to the Ministry of Communication, states that:—

> "The new Salonika may truly be said to stand for the very highest point of scientific, economic and aesthetic development yet achieved on a comprehensive scale in the construction of towns."

To compare the Salonika with the Halifax disaster, it might be mentioned that over 4,500 buildings were totally destroyed and 70,000 people rendered homeless. In Halifax the disaster in December of the same year actually destroyed only a portion of the city and while many buildings had to be repaired, new development was confined to a comparatively small area as compared with Salonika.

General Town Planning News

The reading of current literature indicates increasing activity in town planning throughout the world.

Miss Theodora Kimbal in her review of "City Planning in United States" states that ten years ago the term "City Planning" was little known and less understood. She then mentions the States that have passed laws relating to city planning and zoning and mentions the particular cities that have made progress along these lines, details of which in some instances have been described in the Engineering News-Record during the past year. There are probably a hundred cities that have zoning plans started or completed and probably over a hundred and fifty cities in the United States that in one way or another are interested in city planning problems.

Considerable progress has been made in some of the States in Australia and a recent article by Chas. C. Reade, Government Town Planner to South Australia, describes also the progress in town planning in British Malaya.

Preliminary Notice

of Applications for Admission and for Transfer

20th January 1922

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate member a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in February, 1922.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows.—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option, Railway, Municipal, Hydraulic, Mechanical, Mining or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidat. has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years oe age, and must have been engaged in some branch of engineering for at least four yearsf This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects. Geography, History (that of Canada in particular), Arithmetic, Geometry Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits cientific acquirements, or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

> The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ANGUS—ROBERT, of 550 Princess Avenue, London, Ont. Born at Kingston, Ont., Jan. 11th, 1842; 1865-69, machinist ap'tice, E. Leonard; 1869-71, Haggert Bros. Agricultural Machinery (foreman for one year); 871-74, machinist, E. Leonard; 1873, also designed and superintended constrn. and install'n of waterworks in the town of St. Thomas, also supt. of Haggert Bros. at St. Thomas, designed and constructed steam engines; 1875-76, design, constrn. and install'n of waterworks for town of Sarnia; 1876-89, foreman, E. Leonard & Sons engine works; 1889-91, master mechanic and chief dftsman., Standard Oil Co., Cleveland. asst. to Herman Frasch, chemist, in the perfection of process eliminating sulphur from crude oil; 1891-1900, supt., E. Leonard & Sons; 1900 to date, consulting engineer, at present for C. S. Hyman & Sons, Tanners, London, Ont.

Generation of Steam by Electricity

The field of use for the electric-steam generator, its advantages to the consumer from load-factor point of view and to electric supply company as outlet for surplus power; discussion of types of electric steam generator with particular reference to water-resistance type.

F. T. Kaelin, A.M.E.I.C.

Chief Engineer, Shawinigan Water and Power Co.

Paper read January 19th,1922, before a joint meeting of the Montreal Section of the Chemical Industry, The Engineering Institute of Canada and The Canadian Institute of Mining and Metallurgy.

The purpose of this paper is to bring before the engineering profession an application of electric energy and its conversion to heat energy by means of improved and inexpensive apparatus, the electric steam generator.

This paper indicates the usefulness and limitations of such apparatus in supplementing, and in some cases in replacing existing boiler plants. A description will follow dealing with the design and operation of two variations of a type of generator which have recently been put into operation in this country and which may be of interest owing to their capacity and compactness.

To produce steam by electricity appears at first sight a reversal of common sense, but by analyzing prevailing conditions of energy production, and conversion, accentuated by the existing dislocation of all kinds of productive activities, it is found that the electric steam generator is quite a useful piece of apparatus where hydro electric power is available, and which otherwise would be idle or go to waste. During the time of business depression when the engineer's activity and thinking are of necessity forced towards all kinds of improvements such as increasing efficiency of production, elimination of waste in material, labour and power, the electric steam generator is one of the means to accomplish this, being in fact a handy and simple apparatus, and bringing us nearer the goal of the conservation of energy.

Electric steam generators have been built during the last ten years in a number of European countries possessing hydro electric power, and where in the past five years the scarcity and high price of fuel favoured

the development and use of various methods of generating steam by electricity. There are more than three hundred installations known to exist in Italy, Switzerland, Sweden and France. In Canada and the United States a small number of generators have been in use for a short time. Some of these installations will be dealt with in this paper.

Advantages

Under prevailing conditions where electric power is sold on a kilowatt hour basis, electric steam generation cannot compete with steam produced by fuel, but it is not beyond the possibility that in some remote places where the cost of fuel and freight are high and the cost of a hydro electric development is low, the electric steam generator with its very low capital investment and operating expenses may become a competitor to the method of generating steam by burning coal or oil, but it is not necessary to consider such an exceptional case to prove that the generator fills well its place permanently as a transformer of idle power into useful heat energy. We may consider its usefulness mainly from two different points of view:

Consumers

1. From the point of view of the consumer of electric power owning a hydro electric installation, or purchasing blocks of firm hydro electric power on a flat rate power contract and using this power for manufacturing purposes only during a smaller part of the twenty-four hours. In many manufacturing plants steam has to be produced for cooking processes, drying, humifying, and in all cases heat is required for heating purposes during six months and during the full twenty-four hours. Here we have electric power lying idle for twenty-four hours and paid for. The thought comes to us, what can be done with this idle power? Is there any cheap way of transforming this electric power into something useful? It is well known that electric energy can be transformed into heat energy at a very high efficiency. One of the cheapest ways of doing this is to produce steam which in most cases can be used in conjunction with other steam generating apparatus, and where a system of piping for the purpose of heating or using steam for manufacturing purposes already exists.

The low cost of the steam generator compared with other electrical apparatus for the conversion of electric energy into heat, and the wiring and control apparatus necessary for such equipment, is very much in favour of the steam generator. It can be shown that even in extreme cases where the load factor is comparatively high, for instance in pulp and paper manufacturing plants using a considerable amount of power during six days of the week and having it idle for the seventh day and at the prevailing cost of hydro electric power purchased in big blocks by these companies that it is economically quite feasible to turn the power which was used during six days, mainly for pulp grinding, during the seventh day into steam which is always required in such places, either for manufacturing or heating purposes. It was shown in an investigation made lately that the saving of coal during the fifty-two Sundays and three holidays would easily pay for the installation of the steam generator in less than one year, and there are no doubt quite a number of pulp and paper plants in this country where similar conditions exist and where a considerable saving could be accomplished.

Power Producing Companies

2. From the point of view of the Power Company producing and selling hydro electric power, the present commercial depression and slowing up of the industrial activities have left hydro electric companies with surplus of power for disposal. How long this condition is going to last is uncertain but there is no doubt that a considerable amount of unused power will be available for the next two or three years. Power companies can afford to sell this power at cheaper rates during such time as there is no other market for the power, though preferably under conditions which allow the power company to cancel the contracts on short notice. But at the same time it must be clearly understood that no power company could afford to develop hydro electric power for the main purpose of generating steam electrically in competition with coal.

The problem has been to find a use for this idle power which would not require any expensive installation, new machinery or additional apparatus, for instance transformers, etc., and as it was out of the question to use the power, for new industries or the manufacture of new products which require considerable power like those produced in the electro-chemical industry, one of the solutions was to turn the electric power into heat in the form of steam which is used to a very great extent in many industries, especially in the pulp and paper industry. To do this, of course, other factors have to be favourable such as the transmission of the power, the proper voltage available that would not mean any further transformation and the low cost of the whole installation for generating steam electrically.

Although some of these installations which are in operation today may be considered as quite temporary due to the prevailing exceptional conditions, there is no doubt that in many cases the electric steam generator is going to stay and be used at such times as there is power available from the power companies. This is usually the case during three or four summer months when the waterflow in the river is high and a certain amount of surplus power is available. It may even be feasible to use only night power by close co-operation of the power company with the power user ,and the fact that starting and stopping electric steam generators takes only a few minutes. These are all points which make the steam generator a very flexible apparatus and make it very useful to convert electric energy at any time at short notice and at extremely low cost to valuable heat energy.

Efficiency

In the electric steam generator all electric energy is converted into heat energy, the electric current passes through a resistance either of metal or formed by the water to be evaporated. The whole process of conversion is therefore governed by ohmic law. 1 K.W.H. is equivalent to 3412 b.t.u., the total heat content of 1 lb. of steam at an absolute pressure of 150 lbs. per square

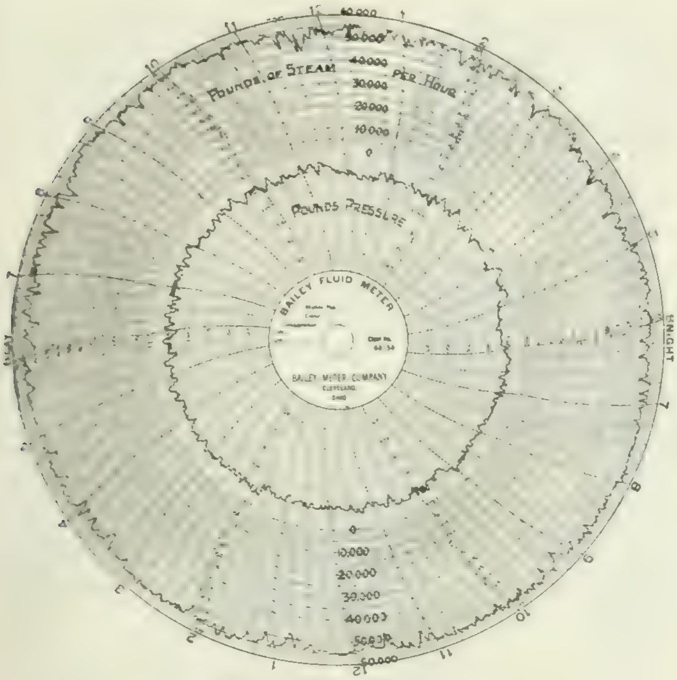

Fig. No. 1 Record of Performance

inch is 1193 b.t.u. Assuming feed water temperature of 150° F. the total heat to be supplied will be 1193 — (150-32) = 1075 b.t.u. I.K.W.H. will therefore produce $\frac{3412}{1075}$ = 3.17 lbs. of steam, no heat loss considered.

The efficiency of the electric steam generator is very high, the only losses are the radiation losses of the appatus, and the heat losses represented by a certain amount of water discharged from the generator which carries away a certain amount of accumulated impurities in the feed water. By proper lagging and regulation of this discharge water the losses become very small and depending on the size of the generator may be from 1 to 4% — for larger sizes of generators the efficiency can be taken around 98%. On this basis 1 K.W.H. will produce 3.10 lbs. steam. Under average conditions 1 lb. of soft coal of about 12, 000 b.t.u. evaporates about 8 lbs. of water. 1 ton of 2,000 lbs. of coal evaporates 16,000 lbs. of water. The electric energy required to evaporate the same amount of water is equal to $\frac{16,000}{3.10}$ = 5161 KWH. = 215 KW days = .59 K.W. years = .8 H.P. year, or in other words 215 K.W. in an electric steam generator is equal to one ton of coal per day, burned under average conditions of boiler efficiency.

Comparing the capacity of an electric steam generator with the capacity of a regular boiler in boiler horsepower, we find the following relations: One boiler horsepower is defined equivalent as the evaporation of 34½ lbs. of water from and at 212° F. per hour and représents 33,479 b.t.u. per hour, 1 K.W. hour being 3412 b.t.u. and at an average efficiency of 98% equal to 3342. These figures are almost exactly in the ratio of 10 to 1, therefore, an electric steam generator of 1000 K.W. capacity is equal to a boiler of 100 boiler horsepower.

Classes of Electric Steam Generators

Electric steam generators have been built during the last ten years in capacities up to 1,000 K.W., and only in the last two years sizes of 2,000 K.W. and more have made their appearance. Steam generators may be divided into two main and distinct classes:

First — Generators in which the electric current passes through a combination of metallic resistors.

Second — Generators in which the water itself forms the electric resistance.

Metallic Resistance

In the first case the metallic resistors in the form of wire and ribbon of some high resistance allow may be mounted in tubes similar to those in fire tube boilers. The arrangements allows the use of alternating or direct current as heating elements do not come in direct contact with water. In all other cases where the resistors are in contact with water and the current passes partly through metallic resistors and partly through water only alternating current can be used as direct current would decompose water into its elements hydrogen and oxygen. Generators of the metallic resistor type are only suitable for low voltages up to about 500 volts and are therefore not usually adaptable for very large outputs. The steam production is controlled by swtiching on and off of a number of parallel circuits and the combination of such circuits in parallel or series connection. To maintain a constant steam pressure requires, therefore, rather complicated and expensive electric control equipment. Generators of this type have been built of 1500 K.W. capacity, being of the tubular type construction, about 20 ft. long and 5ft. 6 inches in diameter. The space occupied by this type of generator is comparatively large compared with the steam generating capacity.

Water Resistance Type

The second class of generators which will be mainly dealt with in this paper are built on a principle quite different from the metallic resistor units. The electric current passes through steam tight insulating bushings to a system of stationary electrodes partly submerged in water, the water to be evaporated serves as the electric resistance. This type of generator is known as the "Revel Generator" and has been in use principally in Italy, Switzerland and France for the last ten years, mostly in self-contained units up to about 700 K.W. For any considerable amount of electric power only a three phase alternating current system may be considered as practical today. For small units and of voltages up to about 2,200 volts, the container itself forms the neutral point of the three phase system and is grounded. For larger capacity generators, especially when the voltage is in excess of 2,200 volts up to 12,000 volts, it will be advisable to split up the generator into three single phase units with three containers, each containing one electrode, the three containers form again the neutral point and are metallically connected together and grounded. Owing to the comparatively high resistance of the water and the many possibilities of arranging the electrodes, it is possible to make use of comparatively high voltages such as are used in general distribution of power in industrial plants,

and the use of step-down transformers, the cost of which would be greater than the cost of the steam generator itself is obviated. In order to maintain a constant steam pressure the generation of the steam has to follow closely the demand of the steam which means the electric power input has to be regulated to suit the steam demand. This is done by the variation of the electric resistance, either by changing the submersion of the electrodes, or varying the specific resistance of the water by suitably adjusting the amount of water fed to the generator and by controlling the water discharged either continuously or at certain intervals, carrying with it the accumulated impurities in the water.

The outstanding advantages of the steam generator of the water resistance type compared with other types are its simplicity in construction, compactness, easy control, and its very low cost per kilowatt capacity which is very often the determining factor, especially for temporary installations or where flat rate power is consumed to fatten the load factor of an industrial plant.

Construction Details of Water Resistance Type of Generator

The balance of this paper will deal only with generators of the water-resistance type. For a long time water has been used as a resistor of alternating current in various apparatus, mainly as energy absorber for electric generators under test and in starting devices for alternating current motors. In the latter case a salt is added to the water as otherwise the resistance would be too high. The use of water itself as an electric resistor for the production of steam is quite obvious though it requires a certain amount of investigation as to the suitability of different sources of water, the variations of the resistance of water at various temperatures and pressure and the practical limits in dimensioning the current path through water for various amounts of energy and voltages up to 12,000 volts. The resistance of chemically pure water is very high and of the order of an insulator, the resistance decreases with the contents of soluble salts — it is lower for spring water than river water. Condensate water, available in most cases where the electric steam generator is in use, is of a high resistance, but as it contains always from 20 percent to 40 percent make-up water drawn from the river or other sources its conductivity is brought up again to quite a practical figure. In general, it can be said, that any water satisfactory for ordinary boilers is also suitable for the electric steam generator. The resistance of water has a negative temperature coefficient; that is, the resistance is decreasing as the temperature and the pressure rise. Considerable investigations and tests have been made by the writer to determine the relations of resistance and temperature for various kinds of water, and special apparatus has been built for this purpose for currents up to 10 amperes and 6,000 volts for tests under atmospheric pressure. Fig. 1, shows a set of curves giving the relation of temperature and resistance for raw water from the St.Maurice River and for condensate water with about 25% raw water from the same source. Using a logarithmic scale the curves appear as straight lines and for many other tests not shown on this diagram it was found that these lines were all very nearly parallel. This would indicate that the same general law applies to any kind of water. The curves have been verified above 100° C. temperature by tests on steam generators under pressure. The curve as shown on diagram, Fig. 2, can be expressed mathematically as follows:

$$R = \frac{C}{\sqrt[5]{T^4}}$$

R = Ohms per cubic inch

C a constant, 42,000 for curve A, 87,000 for curve B temperature of water in centigrade.

In the early stages of the development of the steam generator it was thought that the investigation of the relation of temperature and resistance of different kinds of water would be of great importance but it has been found later by experience in the operation of the steam generator that the resistance of the water in the steam generator could be controlled over a considerable range by discharging a certain amount of water from the generator. The purer the water and the higher the resistance the less water is to be discharged in order to maintain a suitable conductivity of the water.

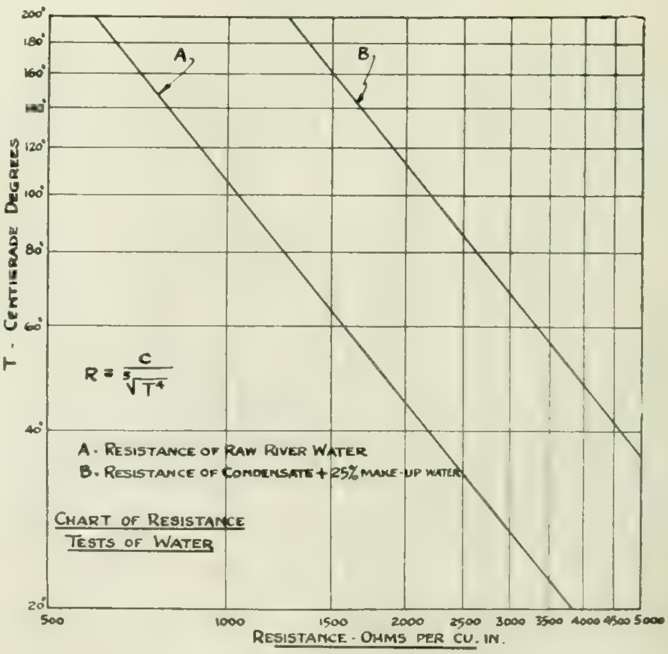

Fig. 2

Fig. 3 shows a section of a 5,000 K.W. generator, it consists of a vertical cylindrical tank with an extension at the bottom. The upper part is flanged and to it is bolted a dished cover which contains three openings for the porcelain bushings insulating the three copper conductors leading to the electrodes. The insulator bushing consists of three parts, two corrugated sleeves, one of which is outside and the other inside the tank and a tube inside these sleeves which are held together by a shoulder and nut of the conductor passing through them. The faces of the sleeves are ground and are parallel and are made steam tight with the usual rubber steam packing.

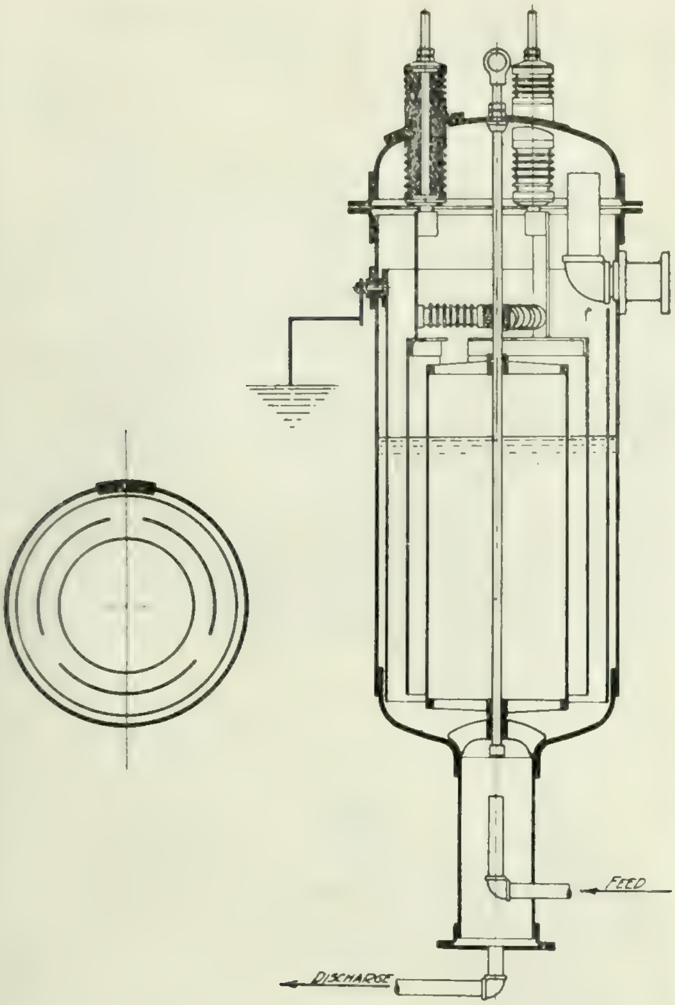

Fig. No. 3 Electric Steam Generator.—Three-Phase-Single Unit System.

The packing also allows a certain adjustment for the difference in the expansion of porcelain and copper. The porcelain sleeves are subjected to considerable pressure and are made rather heavy for mechanical reasons and with electrical characteristics suitable for at least 6,600 volts working pressure between the phases. The conductors support through a system of adjustable links the steel electrodes of curved plates arranged in a circle equidistant from two cylinders, one outside and one inside, forming the neutral point of the 3 phase system, the outside fastened to the generator shell proper and the inside suspended from the cover and well secured in a central position. Both these cylinders are electrically connected to the body of the generator and grounded. The arrangement shown in Fig. 3 is for 1,300 amperes, 2,200 volts, 3 phase, 60 cycles and for a working pressure of 165 lbs. per square inch. The electric current passes through from both sides of the electrode to the inside and outside cylinders, and to a much smaller amount directly from electrode to electrode.

Fig's. 4 and 5 show pictures of two sizes of 3 phase, one tank steam generators of the water resistance type both for 2,200 volt, the small one of 1,500 K.W., and the larger one for 5,000 K.W. capacity, both are of the same general design.

Calculation of Ohmic Resistance

As the path of the electric current is not sharply defined the ohmic resistance can only be calculated approximately.

Let R be the ohmic resistance between electrode and ground

- A = Total area of submerged part of electrode in sq. in.
- d = Distance between electrode and ground in inches.
- s = Resistance in ohms per cubic inch of water at normal operation of generator.
- E = Voltage to neutral
- I = Current in amperes
- P = Electric power in K.W.
- a = Current density $= \frac{I}{A}$ (1)

We have then $R = \frac{d}{A} \quad s = \frac{E}{I}$ (1)

$$A = \frac{I}{a} \quad (2)$$

Substituting in equation No. 1 we get

$$E = d.a.s. \quad (3)$$

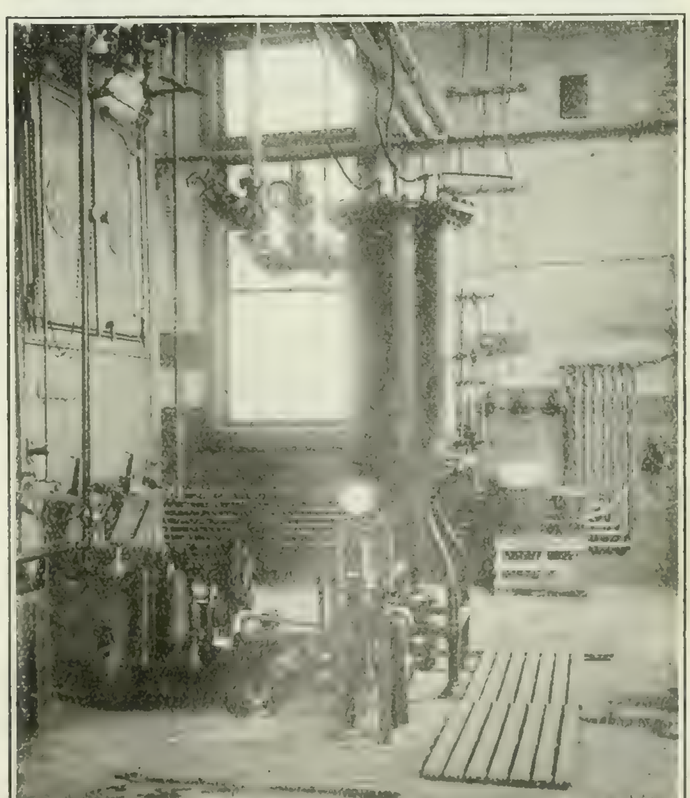

Fig. 4. 1500 K.W. Steam generator, 2200 volts, 3 phase, 100 lbs. pressure.

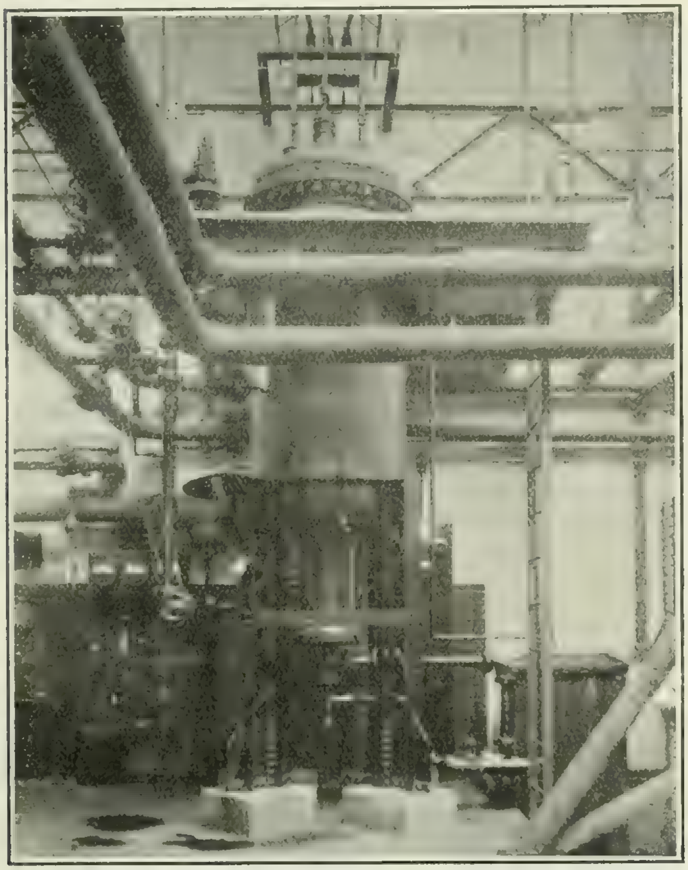

Fig. No. 5 5000 KW Steam Generator, 22000 volts, 3 phase, 165 lbs. pressure.

In equation No. 3 the right side contains three variables, the choosing of which is mainly a matter of experience and compromise to secure a satisfactory mechanical arrangement and safe operation. After d and a are chosen s is fixed—that means for a certain load and water level the specific resistance of the water has to be maintained by adjusting the relative amounts of inflowing and outflowing water. The outside shell of this 5,000 K.W' generator is 42″ (107 cm.) diam. The length of the cylinder part is about 70″ and is designed to stand a test pressure of 350 lbs. per sq. in. The lower end is provided with an inlet for the feed water and an outlet for the discharge and blow-off water. The generator is equipped with the customary water and pressure gauges and safety valves and the tank is mounted on a steel frame; for the larger generators is provided a gallery to give access to the top of the apparatus.

Fig. 6 shows an arrangement of the three tanks forming one steam generator unit, each tank containing one cylindrical electrode connected to one phase on the three phase system. The tanks are connected on the steam side to a steam header, each tank having its separate inlet and bleeder for feed water. The three tank arrangement affords a very simple mechanical design and permits a more accurate calculation of the ohmic resistance of one phase to ground. The resistance of a body of water between two concentric cylinders may be integrated and expressed as follows:

$$R = \frac{s}{2\pi h} \log c \frac{r_1}{r_2} = \frac{E}{1}$$

Where h means the height of the cylinder
r_1 means the radius of outside cylinder
r_2 means the radius of the inside cylinder

From this equation the dimensions of this type of generator may be determined in a similar way as above for the three electrode arrangement in one tank.

In Fig. 7 is shown an installation of such a three tank unit, the general dimensions of the single tank are the same as above for the 5,000 K.W. single tank unit. The voltage is 6.600 volts, the normal power input 18,000 K.W. with a maximum of 22,000 K.W., and at a working pressure of 135 lbs. — Up to 60,000 lbs. of steam per hour are produced. The higher the steam production from a certain area of water surface, the wetter the steam produced. In the above shown installation a 10 inch standard steam separator keeps the moisture content of the steam down to 1½%. Two similar generators of 25,000 K.W. each, and one of 12,000 K.W. are at present in course of construction.

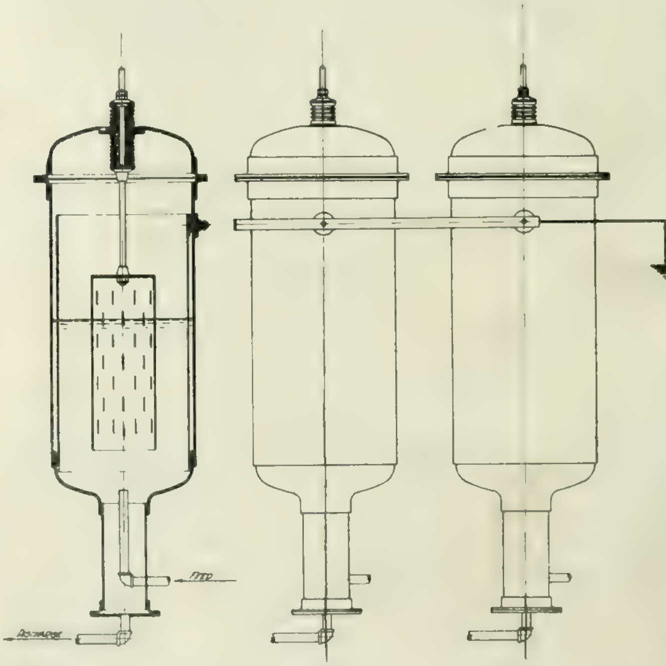

Fig. No. 6 Electric Steam Generator, Three Phase, Three Unit System.

Floor Space and Operating Details

The floor space required by these types of generators is very small, the 5,000 K.W. generator with electric control apparatus can easily be placed in an area of 10 x 12 ft., and the 18,000 K.W. generator, equal to 1,800 boiler H.P., with all its accessories will need a floor space of about 15 x 22 ft., and a head-room for easily dismantling of 25 ft.

The operation is extremely simple for the small generator and where they are not working in parallel with other steam plants, the operation can be made automatic by means of a regulating valve actuated by the pressure and controlling the amount of discharge water, thereby changing the water level, which, in turn, governs the power input and steam production and at the same time keeps the steam pressure constant. For large units and especially where they form only a smaller part of the existing steam plant and are therefore, not able to control the pressure alone, automatic regulation is not so simple, but the attention required is so small that one man could easily handle the operation of two to three very large units. For the electric control of the steam generator the usual apparatus such as disconnecting switches, oil switches, and preferably three ammeters to show the balance in the three phase, is required. Power measuring instruments may be added, depending on the nature of the power contract and supply.

As the heat in the steam generator is produced in the water there are no parts subjected to a higher temperature than the temperature of the steam. This means that no dangerous stresses are produced by temperature differences and this adds further to the safety of the apparatus.

There are other advantages of the electric steam generator over the usual coal fired boiler, for instance any interruptions to feed water supply simply means the shutting down of the generator and does not introduce any danger. The steam generator is equipped with the usual steam safety valves and can in addition be supplied with automatic blow-off valve which discharges the water and thereby shuts down the generator should the pressure go beyond a fixed limit. Other safety devices consist in relay protection of the electric circuit in case of short circuit, unbalancing or ground on the electric system, and a trip for the automatic oil switch, which will interrupt power and therefore the steam supply. It can be seen therefore that the operation of the steam generator is just as safe as, if not safer than the ordinary boiler and the insurance companies have no hesitation in accepting insurance on this apparatus in the usual manner.

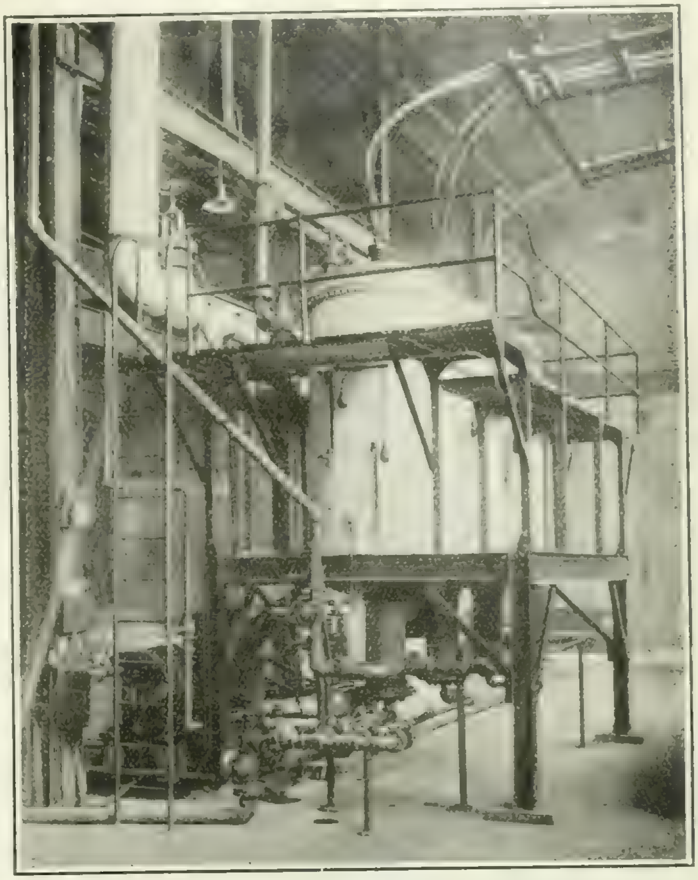

Fig. No. 7 18,000 KW Steam Generator. 6600 volts, 3 phase, 130 lbs. pressure.

Conclusions

1. The generator of the water resistance type is safe and easil controllyed.

2. The apparatus can be installed in a very small space close to where the steam is required. Its design and operation are very simple and only needs the attention of an ordinary skilled man.

3. The generator is the cheapest electric method of converting electric energy into heat.

4. For the consumer of power the generator means the utilization of any idle power and thereby the improvement of the load factor.

5. The power company is able to sell its surplus power for the generation of steam which is made possible mainly by the fact that the first cost and installation of the steam generator is comparatively low.

6. By the introduction of such a simple and cheap device much idle electric power can be utilized, which in itself means a further step in the conservation of our natural resources.

The New 41,000 H.P. Unit at Shawinigan Falls

Julian C. Smith, M.E.I.C.

Description of some of the design features of the latest hydro electric development of the Shawinigan Water and Power Company.

Paper presented at the Professional Meeting, Montreal, January 25th, 1922.

In presenting a description of the latest hydro electric development at Shawinigan Falls it is the writer's intention merely to describe briefly those features of design and construction, which because of their departure from more usual practice, are worthy of attention.

Rating of Waterwheel

The rated capacity of the waterwheel of the new unit is 41,000 H.P. and the wheel will operate at 138.5 R.P.M. under a head of 145 ft. The art of manufacturing waterwheels has advanced rapidly during the last twenty years. The first wheels installed at Shawinigan in 1903 were rated at 6,000 H.P. at 180 R.P.M., and were the largest wheels that could be built at that time. By the time of the second development at Shawinigan in 1910 it was possible to install horizontal double runner turbines with a rating of 18,500 H.P. In 1922 there are wheels in operation of 52,000 H.P., and the Hydro Electric Commission of Ontario are considering for their Queenston installation waterwheels having an even greater capacity.

Water-Flow

In order to provide the water for the unit at Shawinigan, about 3,000 cu. ft. per second additional flow is required. The existing canal through which the water flows to the head-gates is 130 ft. wide by 35 ft. deep. It is restricted to this width at the upper end by the bridge which carries the railroad spur and roadway giving access to the power house. Owing to the fact that the velocity of the water in the canal will be increased only about 25%, or to 3¼ ft. per second, which is not excessive, it was decided that the expense of widening the canal, which would necessitate an additional bridge span, was not warranted. The total flow for the full capacity of 220,000 H.P. at existing load factor for the two power houses at Shawinigan Falls will be about 12,000 cu. ft. per second.

Fore-Bay Extension

The fore-bay extension begins on the downstream side of the bridge and is carried in a straight line to the end of the bulkhead extension. Excavation in this part of the work has been begun and will be carried in the dry as closely as possible to the existing crib. After the bulkhead and the new crib are completed and as much of the rock taken out as possible, the extension will be flooded and the old crib and remaining rock will be removed by dredging.

Gatehouse

The extension to the gatehouse is very similar in detail to the existing building. It is 80 ft. long and contains five sluiceways, each 12 ft. wide, the same width as the sluiceways in the existing building, thus enabling the same stop logs and similar gates and racks to be used. It is not intended to instal gates at present as it is hoped to regulate the flow by the Larner Johnson valve. However, grooves will be left in the concrete so that gates can be installed later if necessary.

Heating System for Prevention of Ice Formation

One of the features of the 1910 development at Shawinigan Falls was the provision for prevention of the forming of ice on the racks. In the early days of the power development at Shawinigan the operation of the gates and the clearing of the racks were made very difficult in winter owing to the formation of ice on all iron parts in contact with the water. It was believed that the formation of this ice was due to the fact that the iron, being slightly colder than the water, conducted heat away from the water thus causing the formation of ice on the iron. In order to raise the temperature of the iron slightly, large air ducts are provided in the gatehouse floor extending the entire length with laterals across the building into the chambers leading to the penstocks so that air can be discharged into these chambers and blown down against the racks. This heating system is being extended to serve the addition to the gatehouse as it has been found that the system is very efficient. A fan with a capacity of 60,000 cu. ft., of free air per minute is located at the far end of the building. The air is drawn into the fan through electric heaters and discharged at a temperature of 150° F. into the main duct. Since the installation of this system there has been no ice formation inside the building and no tendency of the ice in the water to stick to the rack bars. Further, the ice has not formed around the gates and consequently no difficulty has been experienced in operating the head-gates in the most severe weather.

Gathering Tube

A very interesting feature of the development is the tunnel intake designed by Messrs. R. D. Johnson and P. Wahlman of New York. It consists of five parallel water passages, one from each of the sluiceways in the bulkhead, which empty into a manifold, or gathering tube. The water passages are nearly rectangular in section and meet the gathering tube at an angle of about 35°. The upstream water passage is joined to the gathering tube at the control section by means of an elbow, the other passages join the gathering tube in long narrow slots. The gathering tube itself is circular in section, 20 ft. in diameter at the downstream and where it meets the tunnel and tapering to 13′ 4″ in diameter at the upstream end or control section.

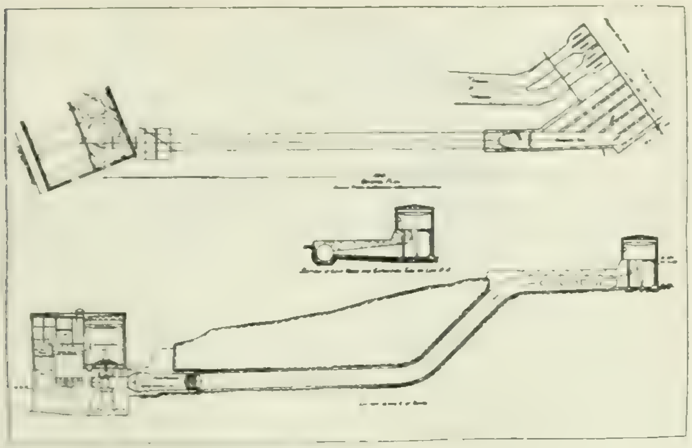

Figure 1

Plan of Extension to No. 2 Development at Shawinigan Falls

The function of the intake is to cause a uniform flow of water in each of the five sluiceways and to discharge the water into the tunnel with a minimum of disturbance. The hydraulic theory of its operation is roughly as follows:

In order to fulfill the hypothesis on which the design is based, the flow from the water passages into the gathering tube must be uniform per unit of length.

The diameter of the gathering tube at any section was fixed by making the quantity of water flowing at that section proportional to the square of the velocity, that is at any point in the gathering tube Q/V^2 is a constant. This relationship was decided on after some study, as giving the most economical dimensions for the gathering tube.

At any point beyond the control section in the gathering tube the water arrives from two sources, a small part of it from a section of the slot adjacent to the point considered and a large part from the gathering tube itself. The difference between the loss of head which has accumulated in the gathering tube up to this point and the loss which has accumulated in the water passage must be just large enough to cause the required quantity of water to flow through the slot.

When losses up to the point under consideration have been determined the depth of slot at that point can be calculated.

The friction loss was based on a coefficient of 130 in the Hazen and Williams' formula, which is equivalent to about N = 0.12 in Kutters' formula and the coefficient of discharge for the slots was taken as 0.98.

The total loss of head in the intake has been estimated to be 4¾″ for a discharge of 2,940 sec. ft. This loss may seem rather large at first sight, but the complication of the design necessary to effect a material reduction did not appear to be warranted by the gain in energy, and the assurance of getting even distribution of flow would be reduced. It was thought proper, therefore, to sacrifice a little head to insure nearly uniform distribution of flow through the racks in the belief that the total loss will be less than would ordinarily be the case with high local velocities through them.

It is interesting to note that the uniformity of distribution is not to any material extent, within reasonable limits, a function of the quantity of water drawn through the intake so that, with the dimensions determined for the maximum draft, the distribution will remain practically uniform for other quantities drawn.

A little study of the problems involved in the design will indicate that the forces dealt with are very small and yet their relation to each other is the only consideration upon which reliance can be placed to secure the desired distribution of flow. A slight variation of the dimensions determined may cause a noticeable unbalance of distribution. This was well shown in a model which was constructed for us by the I.P. Morris Co., and tested in their laboratory. At the first run it was found that the flow was unbalanced, especially between the first, or upstream, and second sluiceways. The model was emptied and the dimensions checked up and it was discovered that the throat of the control section was a little too large. This was corrected by placing fillets 1/8″ thick top and bottom in the throat and the model was again tested with the result that a uniform flow was obtained in all five sluiceways. The scale of the model was 1/15 full size so that these 1/8″ fillets would correspond to a little less than 2″ in the full sized tube.

Tunnel

The water passes from the gathering tube into a tunnel, 20 ft. in diameter, which delivers it to the steel penstock at the bottom. The tunnel was chosen in preference to a steel penstock for economy both in construction and in upkeep. The completed portion of the tunnel has cost less than $370.00 per foot, whereas the steel penstock, which connects the tunnel to the Larner Johnson valve, will cost erected about $450.00 per foot.

The tunnel is lined with concrete averaging about 2 ft., in thickness, which is reinforced throughout its length. The reinforcement for some distance from each end was designed to take care of the static head plus the surge. The allowance for surge at the lower end amounts to a little more than the static head, the combined pressure being 126 lbs. per square inch. In other words, the tunnel at the bottom is reinforced to take care of a bursting pressure of 3,600,000 lbs. per foot. This reinforcement consists of hoops of 1¼″ diameter bars spaced 3″ on centres at the lower end of the tunnel, 12″ on centres in the central part and 6″ on centres at the upper end. The hoops are tied together longitudinally by ¾″ diameter bars about 2 ft. on centres which act as spacers and as temperature reinforcement.

A section of steel penstock 77 ft. long and 20 ft. in diameter connects the tunnel with the Larner Johnson valve. This penstock is built of 1¼″ plates and is anchored into the tunnel by means of seven rings of 4 x 4 x ¾″ angle, which are rivetted to the plates. These rings will also serve as seals to prevent leakage along the penstock.

The loss of head in the tunnel and penstock using a coefficient of .012 in Kutters' formula will be about .7 of a foot, so that the total loss of head up to the turbine will be about 1.1 ft.

The rock through which the tunnel was driven is a very hard granite, compact throughout the length of the tunnel except at the upper end near the surface where faults were encountered.

The tunnel was driven from the lower end in the usual manner by first driving a heading ten to fifteen feet ahead of the face and then shooting down the roof. Most of the mucking was done by a one yard, motor driven, Thew shovel of a type especially designed for this kind of work. The muck was loaded by the shovel into skips, hauled to the portal and hoisted by derricks either to the crusher platform, or to dump cars which carried it to the spoil bank.

Owing to the hardness of the rock the cost of tunnel excavation was high, averaging $7.22 per cubic yard. The cost of drilling and blasting alone was half of this amount, the balance being made up of handling, loading, hauling to dump and pumping.

After the excavation was completed the invert for the lining was placed, beginning at the upper end and working towards the portal, the bottom being cleaned out and the tracks removed just ahead of this work.

The forms were then erected on the invert and the upper part of the lining concreted, beginning about 30 ft. from the portal and working towards the upper end.

The forms for the straight portions of the tunnel were made of 2″ B.C. fir lagging supported on structural steel ribs spaced 2′6″ on centres. The lagging was delivered to the job in 10 ft. lengths and dressed to a 10 ft. radius like the staves of a tank. The steel ribs were composed of two 6″ x 3½″ angles back to back and were anchored to the rock by means of 1″ bolts so that no internal bracing was required and the whole interior of the tunnel was left clear for the dismantling and carrying ahead of the forms as the work progressed.

The concrete was mixed at the upper end of the tunnel and delivered by means of a chute to a hopper part way down the slope. From the hopper it was fed into a pneumatic mixer which forced it under 200 lbs. pressure through an 8″ pipe into the forms. This method of placing the concrete gave us a very dense lining with a remarkably smooth surface.

The forms for the tunnel elbows were built outside on a platform near the carpenter shop and there lowered into the tunnel in sections about 5 ft. long.

Plan and Section of Draft Tube, showing Reinforcement
Moody Draft Tube.

Power House

In designing the Power House superstructure the details of the existing building were followed as closely as possible and the only marked differences are in the elevation of the operating floor and in the height of the new generator room.

The extension is 80 ft. long and the same width and height as the old building, that is, 115 ft. wide by 75 ft. high.

The new unit occupies the upstream part of the extension, the generator room being 50 ft. wide by 80 ft. long and the full height of the building. It is served by a crane, the trolley of which is designed to lift 200 tons and the bridge for a load of 150 tons at either end or 200 tons at the centre.

The operating floor of the new unit is 16 ft. above the operating floor in the old part of the building.

The downstream part of the extension will be served by the 100 ton crane that serves the old generator room.

The Moody draft tube in the substructure of the extension presented a number of difficulties both in design and in construction. The principal difficulty in design was in connection with its reinforcement.

The draft tube block can be described as a flat plate with a circular hole in the middle, the bell of the drafe tube being suspended from the bottom of the plate. The walls supporting the plate are roughly in the shape of a horseshoe, 52 ft. in diameter and 48 ft. between the points. The plate is 12 ft. thick. The total load, including the weight of the block, is something over 12,000,000 lbs. The problem was to reinforce this block in such a way that it could be poured in sections not exceeding 250 cu. yds. which was about a day's run for the mixer.

The most obvious method of reinforcing it was to run bars in two directions at right angles to each other as in an ordinary flat plate. This method, however, was found to be impracticable on account of the fact that there would have been required four layers of 1¼″ bars on 6″ centres each way which would have meant a total of eight layers where the bars crossed, or a net work of bars 4′ deep like a stack of 6″ mesh sieves. It does not require a very vivid imagination to picture the kind of concrete that would have been obtained at the bottom of that mass of steel.

The method used was, therefore, decided upon as most nearly complying with all of the requirements. It consists of hoops and vertical bars placed near the outside of the bell, horizontal bars placed radially at the bottom of the plate and diagonal bars to take care of the shear or web stresses. The part of the block between the points of the horseshoe was reinforced as a beam in order to provide support for the plate on that side.

In this system the bars are in comparatively short lengths and easy to handle. There are at most two layers of bars vertically and they do not cross to form a grid and construction joints can be formed on practically any radial line as there is no shear on the radial planes.

The stresses were limited to 12,000 lbs. per square inch tension in the steel, 500 lbs. per square inch compression in the concrete, and 50 lbs. per square inch bond stress.

In designing and constructing the form work a great deal of care was taken to prevent deflection of the forms and to ensure smooth surfaces for the water passages. The construction of the draft tube bell particularly was a very intricate piece of work and required the services of several pattern makers. The ribs for the bell were all cut and shaped in the shop and the whole assembled before being set in place. We have been amply repaid for the care taken in this regard by the smoothness of the finished surfaces and the resulting accuracy of line and grade which will make the assembling of the machinery merely a matter of setting in place.

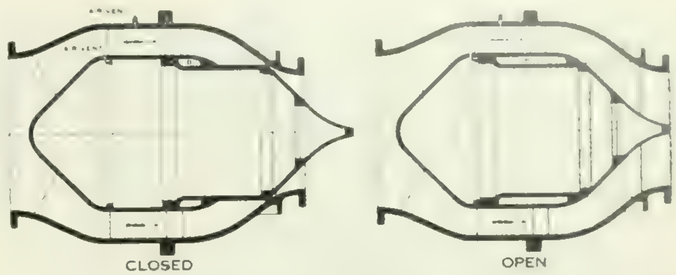
Larner-Johnson Valve

The Larner-Johnson valve which is being manufactured for this development at the Dominion Engineering Works is the largest valve that has ever been built. It is about 23 ft. in diameter and 27 ft. long and weighs approximately 150 tons. The moving part of the valve alone weighs 25 tons.

The valve will be located in a chamber outside of the Power House between the 20 ft. diameter penstock and the turbine casing. It can be operated either in the valve chamber or by means of a three way valve at the generator control board.

The valve consists of a bell-shaped, cast steel shell, 22′-6″ inside diameter tapering to 13 ft. diameter at the outlet, a cylinder inside the shell 16 ft. in diameter which is rigidly attached to the shell and has a conical head pointing upstream and a plunger which slides in the cylinder. The plunger terminates in a conical nose.

Between the cylinder and the plunger there is an annular chamber, sealed at one end by a ring attached to the plunger and at the other end by a ring attached



Type A Larner-Johnson Valve

to the cylinder. These rings are lined with brass and serve as guide bearings for the plunger.

The valve is hydraulically operated by a differential pressure on the two sides of the plunger. When the valve is open and balanced, the cylinder and the annular space between cylinder and plunger are under the full penstock pressure and of course the penstock pressure is exerted on the nose of the plunger. To close the valve the penstock pressure is maintained in the cylinder and the pressure in the annular chamber is released. This causes the plunger to move forward and closes the valve in a manner similar to the action of a needle valve. An automatic damping device slows down the motion of the plunger as it nears the valve seat.

To open the valve the operation is reversed. Water is admitted to the annular chamber under penstock pressure and the pressure in the cylinder is released.

The pressure in the cylinder and in the annular chamber is controlled by means of three 12″ Larner-Johnson valves so arranged and connected that the large valve can be balanced in any position from closed to full open.

Figure 5
Cast Iron Plunger of 20 ft. Larner-Johnson Valve, weight 46.000 lbs.

Selection of Type of Unit

The remainder of this paper will deal with the electrical features of the installation.

When the second hydro electric development was made in Shawinigan in 1910, the horizontal type of unit was adopted and the 18,500 H.P. double runner turbines then installed were among the largest machines to be built at that time. It was then assumed that the ultimate development at this plant would be carried out with this type of machine. When, however, the demands for additional power necessitated an extension of the plant in 1920 and a careful study was made of the more recent development of turbine manufacture it was decided to adopt the vertical type of unit as being the most economical machine to produce the required power.

It is not necessary here to compare at length the relative merits of vertical and horizontal units. In adopting the vertical type of machine for this installation consideration was given to economy of space and material. The centre to centre spacing of the three 41,000 H.P. machines, which will be the ultimate development at Shawinigan is 60 feet. The centre to centre spacing of the present 18,500 H.P. units is 40 feet, so that there is a decided saving of space with the new vertical units. The dimensions of the vertical machines are such that an extension of the present power house on the same dimensions affords ample room. In fact, were it not for the necessity of extending the present crane runway the downstream side of the power house could be narrowed considerably in the extension.

The problem of bearings for vertical units has been successfuly solved by more than one manufacturer and this objection to the vertical type of construction no longer exists. The advantages of weight and low mechanical stresses are on the side of vertical machines so that the change from horizontal to vertical units in this power house is amply justified.

Rating of Unit and Characteristics

The rating of the generator is 30,000 K.W. at 75% power factor which is equivalent to 40,000 K.V.A. The power will be generated at 11,000 volts, 3 phase, 60 cycles and the machine will operate at 138.5 rev. per minute, being designed with 52 poles.

The short circuit characteristics of the machine are such that the instantaneous short circuit current will be 3.3 times full load current and the sustained short circuit current at normal excitation will be equal to twice full load current. It is interesting to note that with the high internal reactance necessary to give these results the short circuit current on light load and correspondingly light excitation will not exceed one-half full load current.

The stator coils are form wound and the mica insulation is put on in the form of tape. The coils under test have withstood a break-down voltage test up to 59,000 volts on the average.

The full load regulation of the machine at 100% power factor will be 15% and at 90% power factor 28%.

Mechanical Features

The rotor is of cast steel and is built to withstand the stresses which would be developed at double normal speed, that is at a peripheral velocity of 21,800 ft per minute.

To facilitate handling, the rotor is constructed in six parts, that is there are three horizontal sections which are split vertically along the axis of the shaft. When the rotor is erected the two halves will be assembled on the shaft and then drawn together with 36 bolts which will be shrunk in place. Each pole piece weighs about one

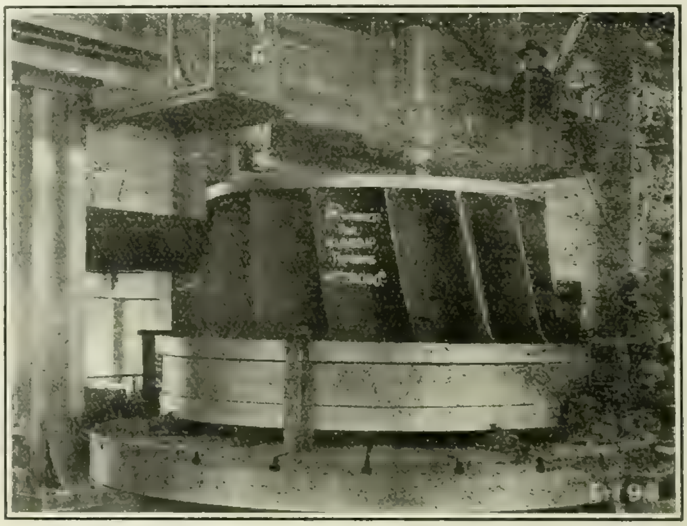


Figure 6
Runner of 41.000 H. P. Turbine being Machined by 18 ft. Niles Bement Pond. Vertical Boring Mill.

ton and is dovetailed into the rotor and secured by wedges and a retaining ring at top and bottom as is usual in this type of construction. In order to reduce windage, the spokes of the rotor are encased with steel plates. The generator rotor and turbine runner are mounted on separate shafts and coupled together on account of the enormous weights of these parts.

Thrust Bearing

The main bearing is of the General Electric spring thrust type consisting of a lower disc with a polished steel surface, split into sectors and supported on a great number of small helical springs on which rubs an upper solid babbitted disc. This construction of the lower disc insures a practically uniform distribution of the weight over the surface of the bearing. The oil flows from an elevated tank up along the shaft and is drawn through the bearing by the centrifugal action of the rotating disc. The lubricating oil is cooled by a water coil which keeps the temperature of the oil below 55° C. and enables the bearing to operate with the exceedingly small oil circulation of about 4 gals. per minute. The bearing is required to carry the weight of the rotor, the turbine runner and the hydraulic thrust which in this unit amount to about 723,000 lbs.

Brakes

In order to bring the machine to rest in a short time when desired, a combination of air and oil actuated brakes is provided which operate on the underside of the rotor. The air pressure required for these brakes is 100

lbs. per sq. in. and a separate oil pressure pump is provided so that the brakes can be used as lifting jacks to raise the rotor.

Structural Features

The structural features of the unit have been so arranged that the operating floor is level with the top of the generator frame instead of with the base as is customary. This arrangement has several advantages as it not only tends to lessen the windage noises but permits the control of the warm air discharged from the generator. The cooling air which amounts to 100,000 cu. ft. per minute is drawn from the wheel pit through radial tunnels and may be discharged from the generator outside the building in the summer, or into the operating room in the winter when the warmth is desirable.

Location of Control Apparatus

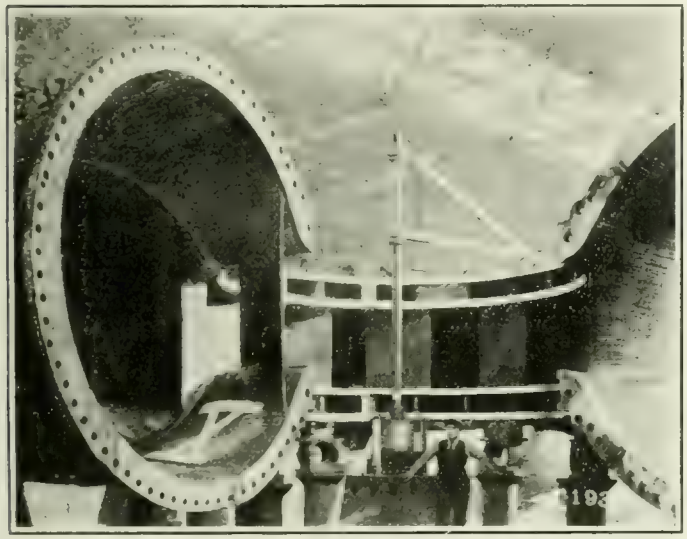

Figure 7
Partial Assembly, of Cast Steel Scroll Casing, 41.000 H. P. Unit, Showing guide Vanes and Lower Distributor Ring

The control apparatus for the generator and turbine will be located on the generator room floor. It is worth noting that in modern station design there is a tendency to place the control apparatus on the operating floor. This reversion to the arrangement followed in the original hydro electric stations is made possible by the design of enclosed and quiet running machines.

Electrical Connections

The keynote of the electrical connections has been simplicity. Each generator will be connected directly to the low tension side of its transformer bank without any intermediary oil circuit breakers which virtually makes each generator and its transformer bank one unit. The 11,000 volt cables from the generators to the transformers are carried in fibre conduits. There are nine single phase cables per unit arranged with the three cables of each phase in a vertical plane. This arrangement gives the best current distribution among the conductors so that although owing to the different reactance of the conductors in different positions, the reactance drop is not the same in all cables, yet the difference is not great enough to cause overheating of any one conductor.

Disconnecting switches are provided in the 11,000 volt cables to facilitate the making of tests.

The will be two 110,000 volt circuit breakers connecting the transformers to the high tension bus as it was considered inadvisable to depend on one switch for so large an amount of power. These breakers are each to be placed in a separate chamber which can be completely shut off so that the effect of a possible fire or explosion may be localised. Provision will be made to ventilate the switchrooms by small electric driven exhausters so as to prevent the accumulation of inflammable gas from the vaporising of the switch oil.

Conclusion

In a brief paper it is not possible to mention all parts of the installation and no attempt has been made to make this description complete as it is intended merely to touch upon the more interesting features of the development.

Rise and Fall in Prices.

A study of price movements during the past hundred years with particular reference to effect of supply of goods and gold.

H. A. Goldman, C.E., A.M.E.I.C.

Advance proof of paper to be read before the Toronto Branch, The Engineering Institute of Canada March 2nd. 1922

Outside of the Great War, there was probably no other subject which has created so much interest, and aroused so much concern in recent years, as the subject of rising commodity prices and the high cost of living.

It is not merely because of its academic importance that the subject has gained such wide spread attention, but because the question of prices is one that so vitally and directly affects the well being of practically every human being throughout the civilized world, and when prices are carried to great extremes, considerable hardship to many people must necessarily follow.

To the engineer the question of prices must be particularly interesting, in the first place, because as a consumer of commodities himself, and as a member of the community he is naturally concerned in any problems affecting the general welfare of the public, and secondly, because engineering is a profession that is closely allied with economics. Not only do engineers have to deal with prices of construction materials in the actual carrying out of their work, but the very adoption or rejection of certain engineering projects may depend entirely on the element of cost. Furthermore, the primary objects of many engineering projects are purely economic ones. The development of hydro electric energy enables our manufacturers to secure cheap power, thereby reducing the cost of the commodities they produce. The construction and expansion of our railroads, the improvement of our highways and the development of our canals, all have the economic aspect as their ultimate accomplishment, tending to reduce the cost, and facilitate the carrying of the goods from the producer to the consumer. The same may be found true in case of many other engineering works where the ultimate economic benefit enters into their consideration. The enormous expansion of railroad construction that took place in the United States during the period following the Civil War has materially assisted in the readjustment of the country at that time by decreasing the cost of distribution of products. It is very probable that the deepening of the St. Lawrence waterway and similar other projects which are likely to come in the very near future, will similarly assist and facilitate the readjustment which we are undergoing at present.

However, in the consideration of the principles governing the movement of prices, the writer has not confined himself to the prices of engineering or construction materials, but dealt rather with commodities in general, because the same principles that apply to general commodities will likewise apply to construction materials.

The Origin of the Recent Rise in Prices

Many people are in the habit of thinking that the recent rise in prices began with the breaking out of the European War in 1914. Most of our comparisons in prices are usually made with those that prevailed either in 1913 or in 1914, and the blame for the increased prices is attributed entirely to the War. But as a matter of fact, a steady rise in commodity prices had been observed in this country as well as in Europe for a number of years prior to the war. Those increases were, however, comparatively slow and gradual, and it was chiefly during the latter years of the war and particularly immediately after the conclusion of the Armistice that price increases have assumed such enormous proportions, that all our former standards of comparison of values were thereby entirely upset; resulting in considerable misery and hardship to people who were not in a position to benefit themselves from the rising prices but who found that with a given amount of money they could no longer obtain as many commodities as they were getting formerly.

The class of people that were first affected by the increased cost of living were naturally those whose incomes were of a fixed nature, such as people who depended on annuities or pensions for their living, or those whose incomes were derived from investments in mortgages and long term bonds, the return on which was a definite and constant amount that could not be changed. These people found it necessary to lower their standard of living if they were to live within the means of their income. As price increases gained momentum, other classes of the population were gradually added to the category of those who were compelled to reduce their living standards. Salaried people were probably the largest single class to suffer from the higher cost of living, because only in isolated and remote cases were salaries raised to any such extent as would compensate for the rising cost of commodities. Organized labour, by means of their strong organization, and because of the increased demand for labour as a result of war activities, were at first able to demand and enforce considerable increases in wages. But as these wage increases were in themselves factors tending to raise prices still higher, the result was the creation of that vicious cycle of which we heard so much during 1919 and 1920, and which merely had the effect of aggravating a situation which had already become too serious to be ignored.

As a consequence, wide spread discontent and restlessness developed throughout the country. Efficiency in industries had considerably deteriorated. Labour strikes were becoming a frequent occurrence, disturbing the trend of business and trade. Coupled as this was with much extravagance and extreme speculation in food stuffs and other commodities, a very unhealthy situation naturally developed.

These conditions received careful attention from the press of the country where considerable prominence was

given to the subject and much space was devoted for its discussion. The ills and evils of the situation were thoroughly discussed. The reasons for their existence were pointed out and various remedies for correcting them were suggested. The profiteer was denounced, the blame for the high cost of living was shifted from one class of business men to another, while the Government was urged to take steps to curb profiteering.

Special agencies, such as the "Cost of Living Commissioner" and the "Commerce Board" were appointed by the Government for the purpose of investigating and dealing with the problem, but apparently even these agencies failed to produce effective relief.

The 1920 Price Collapse

Speculation then became rife as to whether or not the good old prices of 1914 would ever come back. Very few people were willing to go as far as to admit the possibility of that, although some persons were under the impression that a halt to the upward movement of prices was about due and perhaps even a slight set-back. The great majority of people, however, were inclined to the belief that prices would continue climbing higher. This is quite evident from the fact that when finally the turn did come and prices assumed their downward movement, so many people, among them experienced business men and prominent corporations were caught with enormously large inventories purchased at high prices on the expectation, apparently, that they were to go still higher.

It is not surprising however, to find that such should be the case and that people should have expected prices to continue mounting higher, when it is realized that for almost an entire generation commodity prices, except for a temporary halt or occasional slight set back were continuously moving in only one direction, upward.

Under such circumstances it would not be extraordinary for persons who have been observing this fact for the past twenty-five years, to arrive at the conclusion that the rising of prices is only a natural and integral part of our modern civilization and economic system,

Fig. 1

Wholesale Price Index of Commodities in the United States

and that prices must continue to rise so long as our present economic system is maintained.

Yet, if we were to turn the pages of economic history only thirty-five years back we may find that the price movements under our economic system are by no means confined to one direction. We would then arrive again at a period when the price question, particularly in the United States, was very prominent in the public eye. Again we would find the newspapers, periodicals and magazines, giving wide publicity to discussions on this topic and again we would find the Government being urged to take legislative measures to arrest the movement of prices, but with this much difference, that in this period of the historic past around 1885, it was a continuous downward movement of prices that was holding the attention of the public, and it was a downward movement that it was desired to stop. Because up to that time, prices in the United States had been declining continually, though gradually, for nearly twenty years. This decline having begun after the termination of the Civil War, and as it turned out later, a complete turn in the direction of the price movement did not occur until about ten years later around 1896.

It is evident then that an extended period of declining prices is just as much a possibility under our economic system as an extended period of rising prices.

Analysis of Price Movements

A glance at the chart showing the index numbers of wholesale commodity prices in the United States during the past seventy years, reveals four distinct movements. At first we see an upward movement of prices beginning in 1849 and continuing up to 1865, the rise being particularly intensified during the period of the Civil War from 1861 to 1865. This is followed by an extended period of constantly falling prices beginning immediately after the Civil War and continuing until 1896. Then begins another movement of rising prices dating from 1896 and extending through the period of the World War unit the middle of 1920. And finally we find another decidedly downward movement since 1920.

The index curve of commodity prices in England shows similar upward and downward tendencies. Here we find the upward movement coinciding with the period of the Napoleonic Wars, and since then there is a downward tendency until 1896. This tendency was retarded somewhat by three wars, the Crimean War in 1855, the U. S. Civil War, and the Franco-Prussian War in 1871. The year 1896 marks the turning point in the price curve of England the same as for the U. S., the rise continuing up to 1920, and from that day a decided decline in prices is evident.

From observation of these charts it would appear that prices have moved in certain minor and major cycles. The minor cycles being usually of short duration and representing the ordinary fluctuations following the periodical trade cycles of prosperity and depression, while the major cycle, extends for a period covering many years and the upward movement is usually accompanied by an extraordinary event such as an important war which carries prices to such an extreme point that the very height of the price level produces the reaction which sets the pace for the movement in the opposite direction.

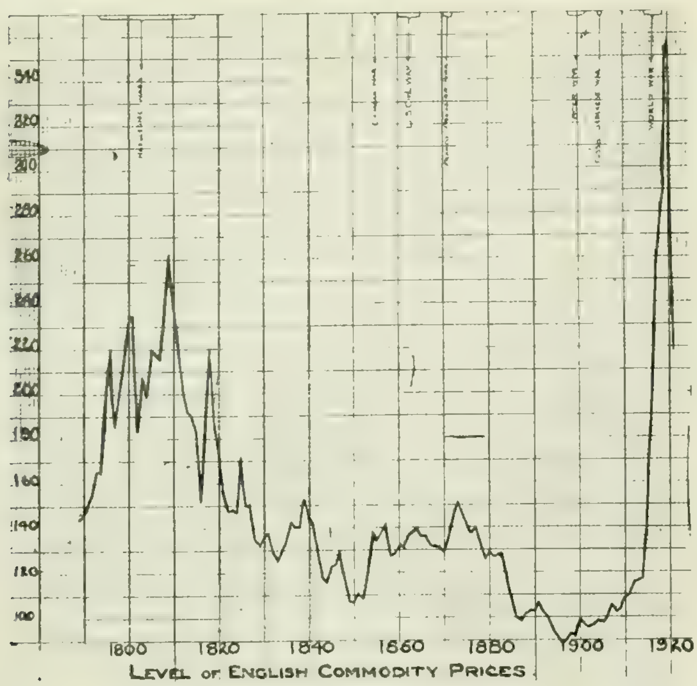

Fig. 2

But what are the factors that are responsible for these variations in the price level? Why do prices of commodities climb sky high at one period and drop to extreme low levels at another period?

These questions have been extensively discussed by economists and various theories have been evolved and suggested.

Factors Responsible for Price Variation

The economic factors that are claimed to be chiefly responsible for variations in the price level of commodities are as follows: — Gold production, expansion of credit and modern banking system, production and consumption of goods, protective tariffs, free trade, freight rates, high wages, high taxes, monopolies, trusts and combinations.

Of those mentioned, the first three factors, namely, gold production, credit and goods are most important, being fundamental in their effect on prices, while the other factors are probably only contributary influences, some of them being themselves the result, rather than the cause of a change in the level of prices.

The effect of gold on the movement of prices is explained by the "Quantity Theory of Money". According to this theory, prices in any given country will vary in direct proportion to the quantity of money in that country. As the quantity of money increases, prices will rise, while a reduction in the quantity of money will produce lower prices. Since in countries that are on the gold standard, the quantity of money bears a certain relation to the gold reserve, it follows that variations in prices will depend on the amount of gold in the country.

The direct manner whereby newly produced gold would exercise its influence in bringing about higher prices is explained by the adherents of this theory in the following way.

Fresh gold produced from the mines will usually find its way to the banks. The banker finding his gold reserve increased much above the required limits established by experience, will naturally look for an outlet for this idle gold whereby he could make it work and earn a profit. His natural course would be to offer a reduction in money rates and thereby induce and encourage borrowing. Traders findings that they can get credit at easy rates will use that credit by entering the market for goods and thereby bidding up prices. This starts the ball rolling, because as soon as prices rise, profits will increase, and that will encourage more people to enter the market, thereby causing greater competition among purchasers of goods. Price increases will spread from one commodity to another until the entire level is raised.

The "Quantity Theory of Money", however, has in recent years been attacked by certain economists who maintain that because of our modern system of banking, whereby many business transactions are settled by means of bank checks without any basic money actually passing from one person to another, and because of the expansion of our credit system, an increase or decrease in the production of gold cannot effect prices in any way. According to these economists, important changes in the price level are produced chiefly by a scarcity or abundance of goods.

What Prices Are

To understand more clearly, therefore, the effect of gold and goods on prices, it is necessary to define the meaning of prices and to recall some elementary principles in political economy.

Prices my be defined as expressions of relative exchange value of commodities in terms of money. If the price of a bushel of wheat is one dollar and that of an overcoat is twenty dollars it is obvious that an overcoat is worth twenty bushels of wheat. It represents the application of our old well known mathematical axiom of "two things equal to the same thing are equal to each other". However, in order that money should act as a standard for comparisons of values, it naturally must in itself have value. Therefore, some commodity must be chosen as a basis for money. Most civilized countries have adopted gold for such basis, because gold fluctuates less in value than other commodities, because it is not very abundant in the world, and because it is not perishable.

In Canada and in the United States, where the unit of money is one dollar, the dollar normally represents a definite quantity consisting of 23.22 troy grains of gold. While prices, therefore, express a relation of value between one commodity and another, they also express a relation between the value of either commodity and that of gold. In the example cited for instance, a bushel of wheat will buy 23.22 grains of gold and an overcoat will buy 20 times that amount, or approximately one ounce of gold. Assuming now that the general level of prices increases 100%, the price of wheat will become two dollars a bushel and an overcoat will cost forty dollars. It is evident then that the increase in prices has not effected any material change in the relation between these two commodities. The farmer will still have to give twenty bushels of wheat before he can secure an overcoat, like-

wise the clothing manufacturer will not be any better off when he comes to purchase wheat. But what about the relation of these two commodities, with regard to gold, after the price level was raised one hundred per cent? There certainly occurred a decided change in that direction, because the dollar being always the equivalent of 23.22 grains of gold, the farmer can now exchange his bushel of wheat for twice the amount of gold that he could have gotten under the old scale of prices, and the same is true of the manufacturer. The same analogy, if carried further to include all other commodities, will show a similar result. It is evident then that an increase in the general level of prices in the same proportion for all commodities will not change their value relation as against each other but will change their value as compared with gold. As commodity prices rise, the value of gold falls, and when prices of goods fall, the value of gold rises. This being so, it is difficult to see how the opponents of the gold theory can ignore the effect of gold on prices.

The exchange value in the open market between one commodity and another, is governed chiefly by the extent of the demand and supply. If a commodity is scarce in the market at a time when there is a considerable demand for it, its value and price will rise as compared with other commodities. On the other hand when there is an abundance of a certain product and no demand exists for it in proportion to the supply, its price is likely to fall.

Effect of Gold Supply on Prices

Now, gold being itself a commodity, the production of which requires land, capital and labour, the same as the production of other commodities, its exchange value as compared with other goods must also be governed by demand and supply. A considerable increase in the supply of gold should therefore eventually cause a depreciation in its value resulting in a rise in commodity prices. On the other hand, a decreased supply coupled with a keen demand for gold should produce the opposite result causing lower commodity prices.

The same should also be true in the case of goods, a great supply of goods should result in lower prices, while a scarcity of goods should have the effect of raising prices.

It is obvious then, that in considering the price making factors we are dealing with two sets of forces of opposite character, which are constantly acting upon both gold and general goods tending to change their relative strength. The resultant of all those forces is the general price level of commodities at any given time. Any force that would tend to increase the production of gold, either through discoveries of new mines or through the development of new processes, whereby lower grades of ore could be profitably worked, or through the introduction of new machinery and improvements in the mining and milling of gold, will have a tendency of raising the general price level, while exhaustion of gold mines, and high cost of producing gold through high wages and high cost of materials used in mining, will have a tendency to reduce the supply of gold and accordingly lead to lower prices. The employment of credit inasmuch as it enables the carrying on of many business, transactions on a small reserve of gold tends to decrease the demand for gold to that extent, and therefore the credit system may also be considered as one of the factors tending to raise prices.

Of the forces, on the other hand, that work on the goods side of the ratio, all those that lead to increased production of commodities, such as substitution of machinery for hand work, improved transportation facilities, increased efficiency, subdivision of labour, introduction of new inventions and improvements, will have a tendency to reduce prices. Factors causing retardation in production and distribution, such as decreased efficiency and poor transportation will lead to higher prices.

United States Prices since the Civil War

In the light of these economic principles let us examine how the major price making factors that have been discussed, namely, gold production, credit and goods, have actually operated in producing the price curves which we have seen. For this purpose the writer has chosen to analyze the price movements in the United States, because of the splendid opportunity it affords of comparing the circumstances surrounding the Civil War and those which have existed during the recent War. Insofar as recent price movements are concerned, while they may have varied in degree and intensity, the general trend, however, has been the same in Canada as in the United States, the discussion therefore, of the conditions in recent years will apply likewise to Canada as to the United States.

The rising movement of prices, which began in the United States in 1849, coincides closely with the important gold discoveries in California. The gold production of the U. S. which was only slightly over a million dollars in 1845, rose to 10,000,000 in 1848, to 40,000,000 in 1849, and reached a figure of 65,000,000 in 1853. From that year production of gold was gradually declining and the figure of 1853 was not reached again until 1898. The price increase of 1849 is easily explained therefore by the increased gold production. The reaction in 1858 was probably due partly to the financial crisis of 1857, and partly to the uneasiness and uncertainties incident to the anticipated Civil War. With the outbreak of the Civil War prices re-assumed their vertical climb, because of the extreme demand for goods required for the provisioning of the army. This demand coming on a reduced supply occasioned by decreased production due to the withdrawal of men from the producing industries into the armies would naturally raise the price of the goods.

Another element which undoubtedly contributed to some extent to the rise in commodity prices during the Civil War, was the depreciation in the currency of the United States. At the outbreak of that war, the Federal Government found itself badly in need of funds. Accordingly an issue of a large amount of paper money in the form of legal tender notes was authorized. As there was considerable uncertainty and lack of faith as to whether these notes would ever be redeemed in coin, their value naturally depreciated to a considerable extent and at one time the paper dollar of the United States was worth less than fifty cents in gold. Depreciation in the money of a country, nearly always leads to speculation, and speculation on the other hand, is practically always accompanied by rising prices.

Once the Civil War was over, the abnormal demand for goods ceased and prices began to drop. Because of the extreme speculation and overtrading that immediately preceded the conclusion of the war, the drop in prices immediately after the conclusion of the war was very steep. This was assisted materially by the fact that a large number of the population that were engaged in the prosecution of the war were now released and turned back into the various industries to produce goods. Furthermore, producers and manufacturers who, under the stimulus of the war demand assisted by certain protective tariff measures, had considerably enlarged their plants and expanded their business, suddenly discovered that the productive capacities of their plants were far above that which the normal pre-war demand would have justified. In seeking an outlet, therefore, for their products, competition among producers which practically did not exist during the period of large demand, now became very keen. Special inducements in the form of price reductions had to be offered in order to dispose of materials. Under such circumstances it is evident that the law of "Survival of the fittest" must hold true, and the one who is able to undersell his competitors, would be the one who would remain in the field.

Producers and manufacturers, realizing that their salvation existed only in being able to produce at low cost and sell at low prices, had to bend all their energies in that direction. Accordingly many economies in the production and distribution of goods were introduced. Efficiency was improved and new improvements in the form of machinery and inventions were adopted. These improvements had the effect of decreasing the cost per unit of product but at the same time they also resulted in increasing considerably the total quantity produced which fact tended further to bring lower prices.

It is quite generally recognized that the fall in prices in the United States after the Civil War, was due to improvements in production caused by the introduction of new machinery and inventions. But what is not generally recognized is the fact that these improvements themselves were partly the result of falling prices. Necessity is the mother of invention. Introduction of improvements frequently means considerable loss of time and money in the way of experimenting, it means discarding old machinery in which considerable capital may have been invested. During times, therefore, when prices are high and profits are fair, producers are not inclined to undergo those losses. It is only during falling prices then, that the greatest stimulus is given to the introduction of new machinery and inventions.

It is clear then that all the forces that were operating on the production of goods during that period were tending towards lower prices. But it is also a fact that the forces that were acting on gold during that period were also operating in the same direction. In this connection it is well to remember that after 1873 falling prices became a world wide affair, and what is true after that year of the United States is true of practically every other civilized country insofar as the price making factors are concerned.

The world's gold production was gradually declining since 1853, when the production of gold was 155 millions dollars. In 1874, gold production amounted only to 91 millions of dollars, while between 1860 and 1889, the annual production never rose above 121 millions of dollars. The mere fact that gold production remained practically stationary during a period when the development of the commerce of the world had made tremendous progressive strides would in itself have been sufficient to appreciate the value of gold. But in addition to this, there were also other causes tending to enhance the value of gold. There was created a great demand for gold occasioned by the desire of one country after another to adopt the gold standard.

The United States adopted it in 1853, and while specie payments were suspended during the War, they were resumed in 1879. In 1871, Germany adopted the gold standard, and later the countries of the Latin Union, Austria Hungary and other countries.

This increased demand coming on a reduced supply, the result is quite obvious, it enhanced the value of gold and accordingly, prices continued to drop throughout the world.

Gold production did not overtake production of goods until the early nineties of the last century, when due to the discoveries of the South African gold mines and to the successful application of the cyonide process in the treatment of ores, the output of gold began to increase rapidly. Gold production of the world which amounted to 120 millions dollars in 1890, rose to 180 millions in 1894, it stood at more than 300 millions in 1899, and was about 450 millions in 1910.

The Rise in Prices since 1896

The rise in prices, therefore, throughout the world, which began in 1896, can be easily explained by this enormous production in gold which resulted in a depreciation of its value. Coupled with this, came the enormous expansion of credit, whicht ended at the same time, to diminish to some extent the demand for gold.

Some economists have attempted to attribute rising prices after 1896 to high wages and to activities of labour organizations in their attempt to retard production. But it is a fact that while prices from 1896 to 1907 have risen about 50 per cent. wages during the same period have risen only 30 per cent. So that the purchasing value of a day's labour actually decreased during that period. While during the period of falling prices, the purchasing value of a day's labour actually increased 80 per cent. from 1860 to 1892. With regard to activities of labour unions, it would appear that this was not a new phenomenon which was confined to the period of rising prices. Writing on this subject in the Century Magazine, as early as 1887, E. Atkinson, referring to activities of trade union organizations, describes them in the following way: "The attempt is made to control the hours of labour by various artificial methods...Other attempts are made by establishing stated lists ofprices, by limiting the quantity of work to that done by any one man, by limiting the number of apprentices and by other similar methods to equalize the material conditions of men". These were apparently the conditions existing during the period of falling prices and if these activities could not prevent the falling of prices before 1896, how can they be considered to be responsible for the rise after 1896.

A high protective tariff in any country would undoubtedly tend to raise the prices of certain commodities in that country, because it would eliminate outside competition, thereby facilitating the formation of combines for price fixing purposes. But on the other hand, it is a fact that the upward movement of prices after 1896, appeared alike in free trade countries as well as in tariff countries. It is difficult therefore, to blame the tariff entirely for the rising of prices.

With regard to the effect of large trusts on the movement of prices, it must be admitted that while on the one hand, the tendency is towards higher prices through the elimination of competition, there is, on the other hand, the fact that centralization of management, and large scale production makes it possible for commodities to be produced at a lower unit cost tending therefore, also to lower prices.

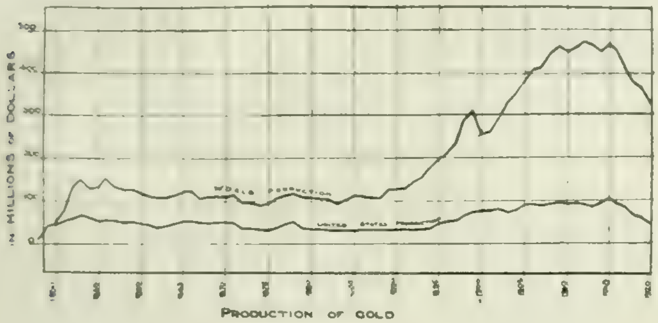

Fig 3

The enormous increase in the world's gold production would appear therefore to have been the most important factor in producing the rise in prices which began in 1896.

The rapid rise in prices incident to the War is familiar to all. It was caused by a shortage in goods and by speculation which was brought about by this shortage. This shortage first appeared in such products as were required for the provisioning of the armies such as food, clothing, boots, munitions, etc. Because of the increasing demand for such articles, prices rose and were accompanied by large profits and high wages. This induced the diversion of capital and labour from industries manufacturing peace time goods into those producing war materials. In addition to this, a large number of young men were withdrawn entirely from all industries, and turned into the armies and navies. This brought about a shortage of goods in all industries, raising the prices of all commodities.

Prices of commodities did not drop immediately after the conclusion of the Armistice. This was due to the fact that this war was world wide and affected the people of many countries and of many nations. For four years these people had suffered from under consumption due to blockades, and to the limited quantities of goods available. For four years they had to deprive themselves not only of comforts, but of actual necessities. When the lid was lifted, therefore, and the days of sacrifice were apparently over, they all began to purchase again. All wanted to get the things they could not get before, and wanted it as soon as they could possibly get it. This sudden increased demand, coming after a considerable period of under production, brought about the enormous rise in prices which we have witnessed during 1919 and 1920.

Prices began to drop in 1920, and continued falling for over a year. During the past six months, the price level remained practically stationary, declines in some commodities, balancing advanced in others. But it does not seem as if the general fall in prices had actually reached bottom as yet. It is more likely that the downward movement will still continue for a considerable number of years, although the declines may be slower and more gradual than they were during the past year. There are many indications pointing in that direction. The enlarged capacities of our producing plants expanded during a period of abnormal war demand, the decreased purchasing power of European countries caused by their adverse currency exchange, the decreased gold production and the probable increased demand for it as soon as the European countries make any attempt to correct their currency value by returning to the gold standard, will all tend towards reduced prices. The fact that the prices of some commodities have already come down very low, thereby reducing the purchasing power of the people engaged in those industries, will force lower prices in such commodities that are still kept above a reasonable level. There is still a considerable spread between the wholesale and retail costs of commodities and for this reason, consumers have not always enjoyed the benefit of the fall in prices, it is likely therefore, that many corrections will yet take place along that line.

Prices and Wages

A question which is frequently discussed in connection with commodity prices is, that of the price of labour. If prices are to continue declining for a long period, will wages also decline too the same extent?

If wage movements of the past could be taken as any criterion for the future, then it would seem as if the level of wages will not decline to any great extent. Wages do not appear to follow the same curve as prices. Following the Civil War, while prices kept on continually falling, wages which also rose during, and immediately after the war, came back but slightly, and finally remained on a permanently higher level. Certain data collected in England on this subject and covering a period of several hundred years would also appear to indicate that when wages have once risen to a higher level they never fall back to the original level. Perhaps this may be one of the secrets of our economic system which apparently aims and leads towards greater comforts and better living standards for the great masses of people. Price rise and wages follow, prices come down, but wages remain high.

But, it may be asked, how is it possible to reduce the prices of goods while wages still remain at a high level? And the answer that history gives us to this question is this, *Engineering, Science* and *Inventions* will make that possible. These are the elements that were always chiefly responsible for the constantly increasing purchasing value of a day's labour, and it would appear that it is to the development of engineering and science

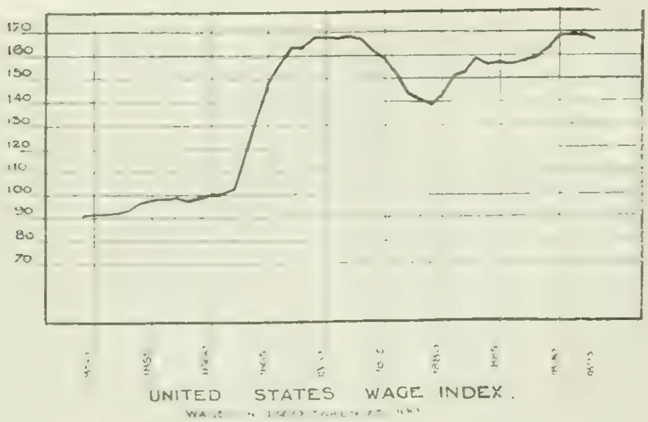

Fig 4

which would make possible the production and distribution of goods at low costs that the world will have to look in the near future, for relief from the present economic difficulties.

The significance of this statement, which would indicate that developments of scientific and engineering improvements will likely play a most predominating part in the economic world readjustment, is of extreme importance to the engineering profession. Because, if it means anything at all, it means that the opportunity is at hand when engineering might become the leading profession of the world. It is claimed that at various periods in the history of humanity, different professions have assumed leadership. At one time it was the clergy that occupied the leading position in the community, then came the medical and later the legal professions, which have similarly occupied leading places. Is it not possible, therefore, that in the coming generation when the entire world must look to science to extricate them from their economic difficulties, is it not possible that the engineer may be placed in that leading position? Is it not possible that very shortly we may find that conditions have so developed that the engineers and scientists are in a position where they are able to render extreme valuable service to humanity?

But if such are the conclusions that an analysis of the present and prospective economic conditions lead us to assume, may we not, on the other hand, ask ourselves the question, when that time does come, is the engineering profession prepared to assume such leadership? It will not do, of course, to ignore the fact that in recent months some very severe criticism has been levelled at the engineering profession, it being claimed that for some reason or other, the engineering profession does not develop the type of men that the public requires and expects it to furnish. When we realize that this criticism came from men who are friends and not enemies of engineering, it lends colour to the belief that there must be some justification for the criticism.

How Engineers May Help

Some five or six months ago, in an address before a joint meeting of Engineering Societies, Mr. Philip Cabot, a Boston broker, frankly and openly told his engineering audience that the opinion of the financial world is, that there is something wrong with the engineering profession, that it does not develop the kind of men that modern ndustry and the financial world demands.

Following a similar trend in a recent address before the American Association for the Advancement of Science, R. C. Harris, commissioner of works for the City of Toronto, expressed similar views when he claimed that the engineer does not fully appreciate the economic aspect in the development of engineering works.

Both Mr. Cabot and Mr. Harris have rendered the profession a most valuable service by giving us an opportunity to see ourselves as others see us. But has the profession done anything to avail itself of this service and benefit by it? Has any engineering organization taken up this criticism and seriously investigated the causes for it or suggested any remedies that would eliminate it? So far as the writer is aware no such official action has been taken by any society and had it not been for a few editorials in the engineering press, the matter might have been ignored altogether. Yet it is the members in the various engineering societies who are most vitally concerned in this question, and in view of the great hopes that the future holds for the engineering profession, the engineering organizations cannot afford to ignore or remain indifferent to this criticism. If there is really something radically wrong with our profession, is it not our duty to take the necessary steps to correct it? If on the one hand, the public has shown its faith in the engineering profession by giving it a legal status in the various provinces, it certainly becomes the duty of the engineers on the other hand, to make their profession one of the highest order and to develop its members to render the public the highest service, and anything that hinders such development should be eliminated.

These suggestions are made in the hope that they may lead to the appointment of a special committee by this Branch, (Toronto) to look into this question in the meantime, and discuss it more broadly at some future date, when other Branches may take up the same question.

In conclusion, there is only one other matter the writer would like to touch upon.

Prosperity and the Falling Market

Many people are under the impression that falling prices must be accompanied by hard times, unemployment, and lack of prosperity. There is nothing to justify such an opinion. The greatest prosperity enjoyed in the history of the United States, was during the period following the Civil War, and up to 1873. It is true that during falling prices, there is no inducement for speculation, but it still has to be proven that speculation is a desirable element in the development of a country.

John Moody, the well known statistical economist, expresses a similar opinion, when he says: "It looks like a parodox, but greater real prosperity can exist during a long period of declining costs than during a long period of boom.... The restoration of the price level to 1914 or below, will mean an advance of the purchasing value of the dollar to the level of 1914 and above. The necessity of doing business under more direct competitive conditions and on smaller margins of profit, makes for efficiency in every direction. With the elimination of easy speculative profits, men get down to work and produce; and it is efficient production that builds up civilized countries — not speculation."

VOL. V. March 1922 No. 3

Montreal and Winnipeg

Those who were fortunate enough to be present at the Annual and Professional Meeting, held in Montreal, agreed that the various functions were of an enjoyable nature, and would result in considerable benefit to the profession. It is not generally known, however, that practically all the details in connection with the various meetings were handled by the members of the Executive of the Montreal Branch, and that they had only a few weeks' notice in which to prepare their programme, and therefore, particular credit is due all who took part in connection with the arrangements for the Meeting, handicapped as they were on account of the time at their disposal.

It should be pointed out that the postponement of the Winnipeg meeting to September 5th, 6th, and 7th, in no way detracts from the importance of this gathering, but rather, since it is being held at a season considered more opportune, it is expected that the Winnipeg meeting will not be second to any of the memorable engineering gatherings held in recent years. Not only do the officers of the Winnipeg Branch extend a most cordial invitation, but the President of *The Institute*, John G. Sullivan, M.E.I.C., being a resident of Winnipeg, is looking forward to the pleasure to meeting a large number of his fellow members at that time.

At the conclusion of his retiring address, President Fairbairn, apropos of the absence of the newly elected President and of the Winnipeg meeting, said:—

> "Gentlemen, at this stage of the proceedings it is customary to bring to the chair of office the new President. I am sorry to say to-day that our new President is not with us. I had a letter from him yesterday, in which he expressed his most sincere regret at his inability to be present, owing to the fact that some very important business matters in Winnipeg prevent his leaving there. He also asks that I give one and all a most hearty invitation to be present at the professional meeting to be held in Winnipeg next September, and he specially requested that that be emphasized in every possible way.
>
> September is a most pleasant month in which to go to Winnipeg. It is the time of year when the Province is harvesting its crop, and making money, and I do not know of any better time to go there I hope everybody present will be able to go to Winnipeg in September, and have an opportunity of meeting your new President. He is a good fellow, and you will realize what that means."

Mining and Metallurgical Institute Meeting

Members of *The Institute* will note the courtesy of the Canadian Institute of Mining and Metallurgy through their Secretary, Mr. George C. Mackenzie, B.Sc., in inviting the executive officers and members of *The Engineering Institute* to their Annual and General Meeting at the Victoria Memorial Museum, Ottawa, from the 1st to the 3rd of March, 1922. In order that this invitation should be received by all members before the meeting, a copy of Mr. Mackenzie's letter was forwarded to the twenty-two Branches of *The Institute*, and no doubt, has already come to the attention of a great majority of the members. At the recent Council meeting the action of the Canadian Institute of Mining and Metallurgy was warmly appreciated. Mr. Mackenzie's letter reads:—
Dear Mr. Keith:—

On behalf of our Council, I have the honour to extend to your Executive Officers and Members a cordial invitation to attend the forthcoming Annual and General

Meeting of this Institute, which will be held at the Victoria Memorial Museum, Ottawa, Ontario, from the first to the third of March, 1922, inclusive.

Yours faithfully,

(signed) *Geo. C. Mackenzie.*
Secretary-Treasurer.

Papers Committee

An innovation in the personnel of the Papers Committee has been made this year, which will doubtless react beneficially to *The Institute.* It has been customary for Council to appoint the Chairman, who with the Chairmen of the various Branches, comprised this Committee. In view of the importance of the work of the Branch Secretaries, and the close contact they have with *Institute* affairs and of the details concerning their own Branch meetings, it was suggested by the Chairman of the Committee that for the coming year, the Secretaries of the Branches constitute the personnel of this Committee. This suggestion was approved by Council, and consequently, the Papers Committee for the coming year, in addition to the Chairman, Frederick B. Brown, appointed by Council, is, O. S. Cox, K. G. Cameron, Harry F. Bennett, M. J. Murphy, Hector Cimon, J. L. Busfield, F. C. C. Lynch, D. L. McLaren, L. T. Rutledge, F. B. Goedike, W. F. McLaren, Geo. C. Wright, Rex P. Johnson, J. Clark Keith, F. T. Gnaedinger, Geo. L. Guy, D. A. R. McCannel, C. M. Arnold, R. H. Douglas, Arthur L. Ford, P. H. Buchan, and H. M. Bigwood.

Leonard Medal Award

The Leonard Medal Committee has recommended and the Council has approved of the award of the Leonard Medal for nineteen hundred and twenty-one, to John Ness, for his paper on "Search for Oil in the West," published in the April 1921 Bulletin of the Canadian Institute of Mining and Metallurgy.

Research Problems

An attractive pamphlet has been issued by the Honorary Advisory Council for Scientific and Industrial Research, of which R. A. Ross, D.Sc., E.E., M.E.I.C., is Chairman, and Colonel F. M. Gaudet, C.M.G., M.E.I.C., Technical Executive Officer, which deals with research, and the problems of unemployment, business depression, and national finance in Canada. It points out the necessity for research in Canada, if this country is to maintain a position of leadership in the industrial world, and advocates the establishment of "The National Research Institute" to provide facilities for conducting research in the public interest, carry on a special confidential study of commercial problems, and provide a Bureau of Standards, maintaining a library for public use, and carry on a continuous study of Canadian materials.

Following are some of the questions requiring to be answered, and which the Research Bureau might undertake.

Who knows the secret of exterminating wheat rust?

No one. Yet by organized and perhaps long sustained research it can be discovered and meantime lack of this knowledge costs Canada and her farmers millions of dollars per year. Valuable work has been done on this subject under the Department of Agriculture and the Advisory Research Council, but much still remains to be done.

What should a black fox eat?

How can this precious little fur-bearer be protected from the ravages of worms? In the answer lies millions of dollars for Canada, and important steps towards the solution of the question have already been taken.

What use can we make of our tremendous supply of Helium? It was greatly needed during the war as a gas for filling balloons. It will not burn—and at war-time prices, Canada is wasting $50,000,000 worth every day of the week.

It is contained in our natural gas and escapes unused into the air. Can we find another use for Helium besides the filling of balloons? Here is enough money to wipe off our railway deficit. The Research Council has promoted the study of this question; the material is available; it is now a matter of finding uses, in time of peace, for this gas of which Canada can become one of the largest producers.

How can Canada be put into a position to meet its own heavy and increasing demands for fuel?

How can the great supply of Lignite in the West and of Peat all over Canada be utilized for this purpose?

The study of these questions, begun by the Department of Mines, at Ottawa, and pushed on by the Advisory Research Council, has reached a point where success is in sight.

What practical way can be found of developing and using the enormous quantities of low grade iron ore that exist in Canada?

This too has received attention. Much has been done though much remains to be done, and the answer cannot fail to be of immense importance to this country.

What can be done with our straw?

What can be done with our saw-mill waste?

What should be done with our liquor from sulphite mills?

What about making artificial fertilizers by the use of our water-powers?

These are some of the problems awaiting Canada's Bureau of Standards and Research; problems which have engaged the attention of the Advisory Research Council, with promising and even valuable results.

Copies of this pamphlet are available to any member of *The Institute* on application to Colonel Gaudet.

Engineers not Employed

While it is not possible to assure members that Headquarters can secure positions in view of the present conditions, it is earnestly desired that all members at present unemployed record that fact at Headquarters, in order that *The Institute* may be better able to serve their interests. Although the outlook for engineering undertakings for the coming year is not promising, it is expected that the next month will see considerable more activity, and consequently a better opportunity of securing positions for those not now engaged.

Besides the actual record of those of our members who are out of work, it would be of interest to know the number of technical men not employed, and any information on that subject will be gladly received.

Assisting Student Members

In a short time the hundreds of students now attending engineering colleges in Canada will have concluded their year's studies. Most of them depend on the work they secure during the summer to assist them to complete their course.

During the last few years a great many students have joined *The Institute* as Student members, demonstrating that they are ambitious to improve their standing in the profession. These same students realize that they need practical experience in engineering, and so desire employment in some capacity on any such work.

A list will be published in *The Journal* next month of Student members available for this summer. Members of *The Institute* will then have a very practical way of assisting and guiding the future engineers along the difficult path of their chosen profession.

Canadian Engineering Standards Association

Arrangements have been made with Capt. R. J. Durley, M.E.I.C., whereby every Branch Secretary of *The Institute* will be placed on the mailing list of the Canadian Engineering Standards Association and will receive all publications, both past and future, issued by the Association. The courtesy of the Engineering Standards Association in this connection will be appreciated by all Branches.

Meeting of Branch Secretaries

A meeting of the Eastern Branch Secretaries of *The Institute* was held at Headquarters on Jan. 26th last, immediately after the conclusion of the Annual and Professional meeting. There were present Messrs. Cox of Halifax, Cameron of Sydney, Bennett of St. John, Murphy of Moncton, Busfield of Montreal, McLaren of Peterborough, Goedike of Toronto, McLaren of Hamilton, Wright of London, Johnson of Niagara Falls, Clark Keith of Windsor, and Barnhill of Sault Ste. Marie.

The chair was unanimously tendered to Mr. Busfield of the Montreal Branch and J. Clark Keith, A.M.E.I.C., of the Border Cities was unanimously appointed secretary. Telegrams of regret were received from Mr. Lynch of Ottawa, Mr. Cimon of Quebec, and Mr. Rutledge of Kingston.

The meeting was opened by each of the Secretaries explaining the principal features, the organization of their Branches and matters of general interest regarding his own Branch. Following which, a discussion was held on the standardization of Branch by-laws and the conclusions were reached that all Branches should take provision in their by-laws for the selection of a Vice-Chairman by ballot; that the Secretary-Treasurer or Secretary and Treasurer be appointed by the Executive committee instead of by ballot; and that all Branches should adopt the calendar year so as to conform with *The Institute*. With regard to this latter point it was felt that difficulties might ensue owing to the change of officers in the middle of the meetings season, but it was explained that this could be avoided by appointing a papers committee to take office in January to obtain papers for the following winter season.

There was a general discussion on the relationship of Branch by-laws and Institute by-laws and it was felt that it was desirable that there should be no conflict between the two sets of by-laws, and a resolution was therefore passed requesting Council to appoint a committee to deal with the question of uniformity of Institute and Branch by-laws.

Ways and means of obtaining greater publicity for the Branches and Institute were discussed at great length, the various Secretaries explaining their own particular ways of handling this matter. Regarding personal service to the membership, particularly in connection with employment, it was thought that little could be done at the present time due to the abnormal conditions. However, each Secretary pledged himself to do everything in his power to impress on those seeking the services of engineers the desirability of giving preference to members of *The Institute* and also to seek the advice of *The Institute* in making appointments.

Fraser S. Keith, General Secretary of *The Institute*, joined the meeting during the afternoon session when a discussion was being held on the desirability of extending the jurisdiction of Branch membership. It was the general feeling that it would be desirable for non-resident members to be brought within the jurisdiction of the nearest branch but that their fees should not necessarily be changed from the present standard.

It was felt that there was considerable difficulty in obtaining suitable speakers particularly in the case of the smaller Branches. Their finances did not enable them to contribute towards the expenses of a visitor and in their own Branches they only had a limited amount of material. A resolution was passed requesting Council to assist the smaller branches by suggesting good speakers and making an appropriation to assist in paying the travelling expenses of such speakers.

A large part of the time was devoted to discussion regarding *The Engineering Journal* and general activities of the Branches particularly regarding ideas for improved attendance at meetings and for making the meetings as attractive as possible for the membership.

The Secretaries felt that the meeting was of great value not only to themselves but through them to *The Institute* at large, not only on account of the information and ideas that were being assimilated but also on account of the inestimable value of personal contact and acquaintance. It was very strongly felt that it would be a great pity if the co-operation being secured through this meeting should not be ensured for the future by making definite provision for all Branch secretaries to meet every year at the time of the Annual and Professional meeting. The meeting concluded with a hearty vote of thanks to the Montreal Branch for holding this first secretarial meeting and to Mr. Duchastel for the hospitality which he had extended to all present.

George Montefiore Foundation

It is announced by the Association des Ingénieurs Electriciens Sortis de l'Institut Electrotechnique Montefiore, Rue Saint Gilles, 31, Liège, Belgium, that a competition under the rules of the George Montefiore Foundation will be held in 1923. A prize amounting to the interest on Belgian securities amounting to 150,000 francs is presented for the best original work on the scientific advance and the progress of technical applications of electricity. Entries for the competition may be written in English or French, but must be type-written. Further particulars may be obtained from the Association des Ingénieurs Electriciens Sortis de l'Institut George Montefiore at the address given above.

American Association for the Advancement of Science, Toronto Meeting, 1921

A. M. Reid, S.E.I.C.

The following details of the methods used in directing the activities of the allembracing American Association for the Advancement of Science, and in particular the stagecraft employed in connection with the now historic Toronto Meeting, may be of interest.

The central and permanent headquarters is small for an Association of such proportions. This results from the fact that the American Association for the Advancement of Science is little interested in the promotion of special policies or enterprises and so needs little administration during the year. Its chief object is to assist the many Societies, which have affiliated with it, to function properly and provide a medium for them for the expression and co-relation of ideas through annual meetings held in conjunction with the central organization.

The problem confronting the Local Committee formed to arrange for the Toronto Meeting was, therefore, largely one of co-ordination, rather than the execution of detailed plans from Headquarters. Toronto representatives of the sixteen sections and many affiliated societies, representing every branch of science, pure and applied, were appointed by those concerned.

Fourteen sub-committees were formed to arrange the many details and the Local Committee Headquarters became a clearing house for information which was passed on to those interested.

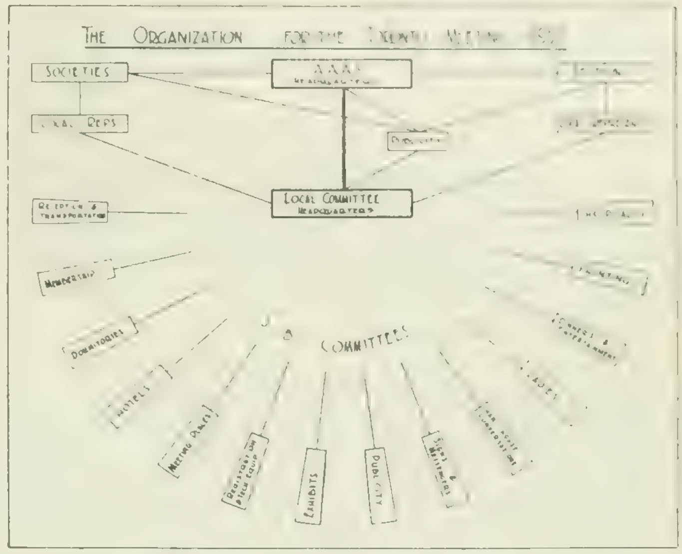

Figure 1

After contact had been established with the affiliated and associated societies and the sections, the fullest possible information for a "Preliminary Announcement" was forwarded to the A. A. A. S. Headquarters for printing in booklet form and distribution.

Special attention was then directed to the collection and compilation of data, and for this a schedule on tracing linen, revised constantly, was used. As information accumulated as to Societies attending, probable attendance, times and location of meetings, etc., it was added, and blue prints and photostats supplied to sub-committees for guidance.

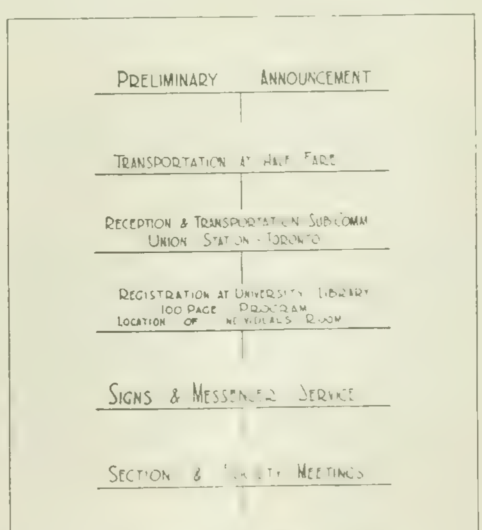

Figure 2.

It was speedily realized that publicity was a most important factor and special liaison was secured with this department by having the Local Committee Secretary, H. L. Seymour, A.M.E.I.C., as Secretary of the Publicity Subcommittee.

Copy was first supplied all technical periodicals and journals. Efforts were made to interest the Secondary School teachers through the University Extension organization, and special circulars to members of the Toronto Board of Trade and similar boards in outlying centres were distributed.

The Publicity Committee concentrated, however, on the daily newspapers and the general reader. To this end a large number of cuts of special speakers and local participants was made. Everyone delivering a paper, of which there were some seven hundred in all, was asked to forward abstracts. These were gone over by a staff of experts in the branch of science treated, and largely rewritten for the general reader. Then, previous to the delivery of the address, some hundred mimeograph copies were made and released for publication. That this was successful from the newspapers viewpoint is shown by the fact that the "Globe" mentioned it as "the first successful attempt ever made in connection with any convention in Toronto to provide a real publicity service".

When the matter of temporary assistance during the meeting arose, it was considered that the University student was the logical employee. A staff of some 110 students was built up on paper and individuals notified as to positions and sub-committees employing them. A corps of sign writers, drawn from the Faculty of Applied Science, designed a number of large and arresting signs, including ground plans on canvas, showing the University buildings being used for meeting places, dormitories and dining halls.

At the result of these preparations, no great difficulty was met with in caring for the actual meeting. The progress of the individual delegate was scheduled from the time he stepped off the train.

A special feature of the registration room was the "visible directory" — a series of slots for the insertion of slips, arranged vertically under the initial, by which one could ascertain whether a member was in attendance, and if so, his hotel or residence, etc. Students on service committees wore distinguishing badges. A feature which might be given more attention in other conventions was the effort to minimize the cost by placing delegates in University dormitories and keeping the charge for functions as low as possible.

The value of such organization was recognized in an enthusiastic manner by the officials and delegates, and *The Institute* may well be proud that so much of the success was due to the presence on the committees of well-known members, mentioned in previous articles, to whose foresight and executive ability the smoothness of operation whch characterized the meeting can be largely attributed.

EMPLOYMENT BUREAU

Situations Vacant

Representative for Montreal

Representative for Water Tube Company (American) wanted for Montreal and vicinity. Company has been established twenty-five years. Boiler is used mainly for heating schools, houses, theatres and public buildings. Apply Box 213.

Civil Engineer Superintendent

Wanted a technically trained Civil Engineer Superintendent who has had experience in breaking up and removing large masses of rock, such as very heavy railway cuttings, iron or copper open pit work or big hydraulic canals. Vacancy is for large English company in Spain. Single man and College graduate preferred and Steam Shovel experience in hard rock essential. Box 212.

Steam Shovel Foreman

Also wanted practical Steam Shovel Foreman to manage and instruct Steam Shovel drivers and manipulators.

Reply stating full experience, salary expected, age, married or single, if any knowledge Spanish to — Box 212.

Representative for Heat Treatment

Representative for Eastern Canada wanted for Surface Hardening and Carburizing Compounds. Attractive proposition offered. Apply Box 214

Situations Wanted

Mechanical Engineer

A.M.E.I.C., mechanical engineer in charge of construction and maintenance for the British America Nickel Corporation since March 1919, owing to disbanding of staff desires position. Previous experience includes engineering products, pulp and paper mills, steelworks maintenance. Designer of improved lines of pumping plant. Certified Member of American Association of Engineers. Age 32, married. Apply Box 89-P

Civil Engineers

Royal Military College Graduate 1903, A.M.E.I.C., At present employed in charge of responsible work. Would like a change. Location immaterial. Fifteen years in responsible charge of surveys and construction on canals and railways in Canada and overseas. Served with distinction in the Great War. Apply Box 88-P.

B.A.Sc., (Honours) U. of T., A.M.E.I.C., married, age 36. Ten years experience on surveying, railway construction, reinforced concrete bridges, sewers, waterworks, reinforced concrete and mill construction buildings as engineer in charge of construction. Open for engagement on short notice. Would like position with firm of contractors or as sales engineer. Apply Box-90-P.

Members Exchange

Books for Sale

Transactions of the Institution of Civil Engineers from Volume 1 to 1836 to Volume 120 of 1894-5, complete except the years 1843 to 1854-5 inclusive.

Engineering Record, Volumes 9 to 1884 to Volume 35 to 1896 complete.

The books are in Toronto and any inquiry will be given full particulars at to bindings, condition, etc. Apply Box 21-A.

Canadian Market for British Steel Castings

A member of *The Institute* in England, is interested in an up-to-date company manufacturing steel castings, and would be glad to hear of firms requiring special steel castings. Box 22-A.

Patent Pipe Bend

The above bend, patented by L. McL. Hunter, Jr.E.I.C., city engineer's office, Ottawa, is being used in Ottawa for a catchbasin trap.

The old method was to use an ordinary quarter bend but these would not allow of the thawing out of the pipes. The bend had to be broken to get the nozzle of the thawing apparatus into the pipe.

With the above bend the thawing and flushing is very easily carried out. Also drain cleaning rods can be introduced to remove any blockage in the pipes.

The sole distributing agents for Canada are the T. S. Kirby Co., 213 Sussex St., Ottawa.

Meeting of Society of Chemistry Industry, Montreal

"Chemistry and the Motion Picture" formed the timely and popular subject of an intensely interesting lecture by Dr. C. E. K. Mees, of the laboratories of the Eastman Kodak Company, Rochester, N.Y., in speaking before the Montreal Section of the Society of Chemical Industry, Montreal, held at the Queen's Hotel, Monday the 20th of February.

The monthly meeting of the Society was preceded by the usual dinner, after which H. W. Matheson, the chairman, introduced the lecturer of the evening, Dr. Mees, who was given a very hearty reception. This was not the first time Dr. Mees spoke before the Society, he having been one of the visitors from the United States at the annual meeting of the Society of Chemical Industry held at McGill University last August, at which he gave a paper dealing with "The Preparation of Synthetic Organic Chemicals".

In dealing with the more popular subject, the making of the motion picture film, Dr. Mees illustrated his lecture with lantern slides which were most elucidating.

In part he said the development of the motion picture has depended upon improvements in the apparatus for taking and projecting the pictures and in the sensitive film on which the pictures are recorded. The manufacture of film starts with cotton, which, after washing and drying, is treated with a mixture of sulphuric and nitric acid until it has absorbed the right amount of nitric acid, as result of which it becomes soluable. After washing out the excess of acid, it is mixed with the solvents in large condensers, and stirred until completely dissolved The solution is then coated upon a wheel 20 feet in diameter, having a very smooth surface, from which the film is stripped as it is formed by the evaporation of the solvents. The sensitive emulsion is made by precipitating a solution of silver nitrate with bromide derived from the brine wells of Michigan, the silver nitrate being made by dissolving metallic silver in nitric acid. The making of motion picture films absorbes a significant proportion of the world's production of metallic silver. The precipitation of silver is carried out in the presence of gelletine, and the "emulsion" as it is called, is coated upon the film by dipping one side of the film passing over a roller into the melted emulsion. It is then chilled and sets as a jelly and is dried.

The film is slit to the exact width required for the motion picture, 1⅜ inches, and is perforated and packed up in rolls of 200 or 400 feet.

The film is of two kinds, the negative film, which is used for taking the pictures and which is extremely sensitive to light, and the positive film, on which the negatives are printed to produce the pictures projected in the motion picture theatres. The negative film is exposed in the camera in the motion picture studio or out of doors, and is then developed, usually by winding it upon a rack, which is then inserted in a tank of developer. The film, after fixing and washing, is dried on huge revolving wheels. The negative is examined and then printed on to the positive film in a printer so designed that the intensity or time of printing is automatically varied to compensate for changes in the density of the negative, and the positive film is in its turn developed, fixed, washed and dried. Positive films are then examined and joined together to make the continuous roll of film used in production, positives often being tinted with a dye or made of tinted base, or the image toned to some colour in order to produce various effects.

Besides the manufacturing, the chemistry of the motion picture deals with the nature of the emulsion and with the changes which go on in it when exposed to light, developed and fixed.

If a picture be examined under a high-power microscope, the image will be found to consist of tiny grains of black silver looking like masses of coke. These grains have in their turn been formed during development from the original silver grains of silver bromide, of which the emulsion was composed, which are crystalline in nature,

the effect of light action being to make the silver bromide more easily attacked by the developer, which transforms it into the black metallic silver. The silver bromide which was not affected by light and consequently not changed into silver by developer, is removed in the fixing bath, leaving only the black grains of metallic silver to form the final image.

Trade Publications

Wood Stave Pipe, published by the Pacific Coast Pipe Company Limited, 1551 Granville Street, Vancouver, B.C. This booklet deals with the history and applications of Wood Stave Pipe. It contains in addition to the above a number of useful tables.

Locomotives, published by Geo. D. Whitcomb Company, Rochelle, Ill. A series of bulletins dealing with the types of gasoline and electrical locomotives built by the Company.

Generator Cooling Apparatus. Bulletin 246, published by B. F. Sturtevant Company, Hyde Park, Boston, Mass. The different arrangements of Generator Cooling Apparatus are described and information given regarding fitments for various types of cooling apparatus.

Price Rathbun Stationary Oil Engines. Form 101020 published by Canadian Ingersoll-Rand Company, Limited, Sherbrooke, Que. The Price Rathbun Stationary Oil Engine is a semi-Diesel type; the features of the engine, its cycle of operation and applications, are outlined in a twenty-eight page booklet.

OBITUARIES

Robert A. Galbraith, A.M.E.I.C.

Robert A. Galbraith, A.M.E.I.C., after a long illness died on Dec. 29th. at his residence at Carleton Place, Ont. Mr. Galbraith was born at Ramsay, Ont. in 1860 and began his engineering experience as chainman and rodman on the Ottawa, Arnprior and Parry Sound Railway. He was promoted to assistant engineer on the same line and later moved to Northern Ontario where he played a prominent part in the development of that section of the Province. The last few years of his life was spent at Carleton Place, where he became well known. An athlete throughout his life, Mr. Galbraith was distinguished first in football and cricket, and later in curling; sportmanship was an outstanding characteristic. Mr. Galbraith is survived by his wife and one daughter. He was elected Associate Member of *The Institute* on Oct. 12th, 1899.

Captain A. G. Knight, S.E.I.C.

Captain A. G. Knight, D.S.O., M.C., S.E.I.C., is reported by Militia Headquarters, Ottawa, to have been listed as missing on December 20th, 1916, as no further information regarding Captain Knight has been received; it is presumed he died on or about that date.

Captain Knight was born at Bedford, England, in 1895 and was taking an engineering course at the University of Toronto when the war broke out, he was one of the first to enlist and had a distinguished career in the Royal Flying Corp before his untimely death. He was liked and respected by all who knew him in his "year" at Toronto and his loss among many "School Men" was most keenly felt. Captain Knight became a Student of *The Engineering Institute* in his freshman year, 1914.

Late A. E. B. HILL, M.E.I.C.

Engineering Legislation in U. S.

According to a circular issued by the American Association of Engineers, laws licensing engineers and architects who design and supervise the construction of buildings have been passed in the following states:—Arizona, Colorado, Florida, Indiana, Illinois, Iowa, Louisiana, Michigan, Minnesota, New Jersey, New York, North Carolina, Oregon, Pennsylvania, Tennessee, Virginia, and West Virginia, in all, 17 states. Such laws are now before the legislatures of Kentucky, Mississippi, and South Carolina.

PERSONALS

S. J. Fisher, M.E.I.C., recently accepted a position with The E. B. Eddy Company, Limited, at Hull, Que.

H. S. Grove, A.M.E.I.C., is at present with the Ottawa Hydro-Electric Power Commission.

Geo. M. Hudson, A.M.E.I.C., has been appointed division plant engineer, The Bell Telephone Company of Canada, Montreal, Que.

B. B. Hogarth, A.M.E.I.C., inspecting engineer of the Dominion Water Power Branch, is at present on work connected with his departmen at Great Falls, Man.

F. P. Flett, Jr.E.I.C., is at present with the Trussed Concrete Steel Company of Canada, Limited, Walkerville, Ont.

E. R. WOODWARD, S.E.I.C.
Winner of Students' Prize 1921

G. R. Holmes, S.E.I.C., formerly of Nova Scotia Technical College, is now with Eagar, Coombs & Company, Limited, Halifax, N.S.

E. L. Pettingill, A.M.E.I.C., formerly of Copper Cliff, Ontario, has joined the staff of the Canadian Des Moines Steel Company, at Chatham, Ont.

C. E. Fraser, A.M.E.I.C., has served his connection with James Proctor and Redfern, Limited, consulting engineers to take the position of township engineer and road superintendent for Birch Cliff, Toronto, Ont.

J. A. Grant, A.M.E.I.C., formerly of St. John, N.B., has taken up residence in Montreal, with an office in the New Birks Building, under the firm name of J. A. Grant & Company, Limited, engineers and contractors.

E. M. Medlen, A.M.E.I.C., formerly structural draughtsman, Hamilton Bridge Company, Hamilton, Ont., is now with the Geodetic Survey of Canada, Department of the Interior, Ottawa, Ont.

David G. McKean, A.M.E.I.C., formerly with the Greater Winnipeg Water District, has become associated with the firm of McKean & Renwick, contractors, Glasgow, Scotland.

A. B. Cooper, M.E.I.C., formerly with the Canadian General Electric Company Limited, has been appointed general manager of the Ferranti Meter and Transformer Manufacturing Company Limited.

N. L. Somers, A.M.E.I.C., has sold out his interests in the firm of Reid and Somers Limited, engineers and contractors. Mr. Somers has not yet announced his future plans.

Walter J. Parker, S.E.I.C., vice-president of the Steward Construction Company Limited, has recently taken up his residence in Preston, Ont. Mr. Parker was formerly in Toronto.

E. L. M. Burns, R.C.E., Jr.E.I.C., has recently returned from the School of Military Engineering, Chatham, England, and is now stationed with the Officer's Mess, R.A. Park, Halifax, N.S.

D. M. Chadwick, A.M.E.I.C., formerly with the Maritime Bridge Company of New Glasgow, N.S., has been appointed sales engineer with the Canadian Bridge Company Limited, 510 New Birks Building, Montreal, Que.

R. L. DOBBIN, M.E.I.C.
Member of Council and first Secretary of the Peterborough Branch.

C. T. J. Laurendeau, S.E.I.C., B.Sc. A., graduate of Laval University, son of Judge Laurendeau of Montreal, has joined the sales staff of the MacKinnon Steel Company Limited, with office at 404 New Birks Building, Montreal, Que.

Brigadier General A. G. L. McNaughton, C.M.G., D.S.O., accompanied by Mrs. McNaughton, returned to Canada last month. He has resumed the duties of director of military training at Militia Headquarters, Ottawa, after having spent a year attending the Staff Course in England.

S. J. Fortin, M.E.I.C., has been appointed city surveyor for the City of Montreal. Mr. Fortin will have full charge of the "supervision of all streets, squares, highways, common sewers, and all other public works or places connected with his department; to make and have charge of all the levels, lines, surveys, measurements, sketches and plans of the city generally, or any part thereof, whenever required to do so; to examine and determine from time to time, whether any repairs or improvements may be necessary to any street, sidewalk, sewer, or other public work under his supervision". He has been with the City of Montreal for several years, and his promotion is well deserved.

Interesting Hydro-Electric Development.

A very interesting hydro-electric development work is in progress in Mexico, under the direction of G. R. G. Conway, M.E.I.C., now managing director of the Mexican Light and Power Company, and formerly chief engineer of the British Columbia Electric Railway Company, Vancouver, B.C. The load of the Mexican Light and Power Company has been creeping up enormously during the past three years, and is now about 420 million kilowatt hours per annum. This enormous growth of load has seriously handicapped the company and some time ago it was decided to proceed immediately with the development of a new plant below the existing Nacaxa plant, capable of generating about 40,000 additional horse power. This work is now in progress and involves the construction of a tunnel about 4½ kilometers in length, destined to carry about 27 cubic meters per second. The work is being forced rapidly ahead, and it is hoped to have the power available by March of 1923. The company is also developing a smaller plant to the south of Mexico in the State of Morelos, which will give about 25,000 horse power additional. Half of this will probably be available for use about next July.

T. W. Harvie, A.M.E.I.C., appointed as Chief Engineer of Montreal Harbour Commissioners.

T. W. Harvie, A.M.E.I.C., who has recently been appointed chief engineer for the Montreal Harbour Commissioners, is like many engineers a native of Scotland, where he spent his early days and received his technical education. Following experience as resident engineer with the Caledonian Railway Company, Mr. Harvie was engaged for three years in heavy railway construction and was later on the staff of the Clyde Navigation Trust. He served as resident engineer on various harbour works and later became engineer for Sir Robert McAlpine and Sons. In 1910 Mr. Harvie was appointed assistant engineer to the Montreal Harbour Commissioners and for three years was engineer on the construction of the Victoria Pier and the Market Basin, as well as the shore wharves and the upper section of the high level railway. Mr. Harvie has had twenty-five years experience in engineering, over twenty years of which have been spent exclusively in connection with harbour and dock works. He is, therefore, eminently fitted for his new and important position.

Resignation of Head of Montreal Water Board.

A. E. Doucet, M.E.I.C., who has resigned recently as head of the Montreal Water Board, was born in 1860 in the City of Montreal. He graduated from Royal Military College, Kingston, and following experience as rodman on construction of the Algoma branch of the Canadian Pacific Railway, he was appointed resident engineer on the Lake Superior Jackfish Bay line, in 1883.

A. E. DOUCET, M.E.I.C.

He was later appointed assistant engineer of the Lachine Bridge construction in 1886 and the year following was division engineer of the Canadian Pacific Railway at St. John's, Que. For three years from 1887 Mr. Doucet was chief engineer of construction for the contractors building the Algoma & Sault Ste. Marie Railway, the Cape Breton Railway and the Newfoundland Railway. For seventeen years beginning in 1898, Mr. Doucet was chief engineer in succession of the Arrowhead & Kootenay Railway, Quebec and Lake St. John and district engineer at Quebec for the N.T.R. Railway. In 1915 Mr Doucet engaged in private engineering practice. In 1918, he was appointed head of the Montreal City engineering department, and later was appointed head of the Montreal Water Board which has done notable work in connection with the aqueduct.

Mr. Doucet is a man of wide vision and many activities. He has been a member of *The Institute* since its foundation as The Canadian Society of Civil Engineers, he has acted on the Council and has been Chairman of the Quebec Branch. He has been interested ever since his college career in military affairs, and served with distinction during the North West Rebellion.

Resignation of F. W. Cowie, M.E.I.C., as Chief Engineer of Montreal Harbour Board.

After thirty-six years of continuous service in connection with the River St. Lawrence Ship Channel and the Harbour of Montreal, F. W. Cowie, M.E.I.C., has resigned from the position of chief engineer of the Harbour Commissioners, and has been appointed consulting engineer to the board.

Immediately after his graduation from McGill University in 1886, Mr. Cowie joined the staff of the Harbour Commissioners of Montreal under the late Sir John Kennedy, then chief engineer. For twenty years Mr. Cowie was directly connected with the River St. Lawrence Ship Channel, and became an authority on river hydraulics, dredging and improvements to navigation.

In 1907, when the Harbour Commission of Montreal was reorganized and the chief engineer, the late Sir John Kennedy, Hon.M.E.I.C., appointed consulting engineer, Mr. Cowie received the appointment of chief engineer.

For the last fifteen years, Mr. Cowie has been engineering head of the Harbour Commissioners, and his scheme of improvements, designed in 1909, and adopted by the commissioners after recommendation by a board of consultative engineers, is now about completed.

Few engineers have had the advantage of such experience as Mr. Cowie. He had the advantage of training and association with that great engineer, the late Sir John Kennedy. For the Government of Canada and the Commissioners of Montreal Harbour he has a record of accomplishments. His schemes were recognized as in the public interest and they went through.

In 1914 the Council of the Institution of Civil Engineers of London, England, awarded Mr. Cowie the coveted Telford gold medal for his paper on "The Transportation Problem in Canada and Montreal Harbour."

New Chairman, Ottawa Branch

K. M. CAMERON, M.E.I.C.

K. M. Cameron, M.E.I.C., the new Chairman for 1922 of the Ottawa Branch, was born at Strathroy, Ont., November 1st, 1880. Securing his preliminary education in the public schools of that place and the Collegiate Institute of Strathroy and London, he graduated from the Royal Military College in 1901 as silver medalist, and from McGill University, in 1903, as Master of Science in Civil Engineering. He has been connected with *The Engineering Institute of Canada* since 1901, when he was elected as Student. His engineering experience has been gained at the Canadian Niagara Power Company, at Niagara Falls, under the late C. B. Smith; on the Pennsylvania Railroad Tunnels, New York; on the construction of the hydro electric plant of the Bar Harbour and Union River Power Company, at Ellsworth, Maine; with the Ambursen Hydraulic Construction Company, in Wyoming, and the Department of Public Works of Canada. He entered the service of that Department in 1908 as principal assistant to the district engineer at London, Ont. was promoted to district engineer at Sherbrooke in 1911, and came to Ottawa in 1912 as assistant to the assistant chief engineer of the Department. When A. R. Dufresne, M.E.I.C., assistant chief engineer, left the Department in 1918, Mr. Cameron was promoted to succeed him. The position of assistant chief engineer of the Department of Public Works is one of the most important in the Dominion Public Service and during his tenure of office Mr. Cameron has shown outstanding ability both as an engineer and administrator.

Ottawa Branch has been fortunate in its choice of Chairman, and in electing Mr. Cameron the Branch is assured of continued energy and activity in the direction of its affairs.

Engineers Honour Mr. St. Laurent

Arthur T. St. Laurent, M.E.I.C., after a long and faithful career in the Public Works Department, has been promoted to the position of chief engineer of that department, a position carrying with it large responsibilities.

Members of the Ottawa Branch of *The Engineering Institute of Canada* at a special luncheon on February 15, evinced in a remarkable manner their approval of the appointment and the esteem in which they held him.

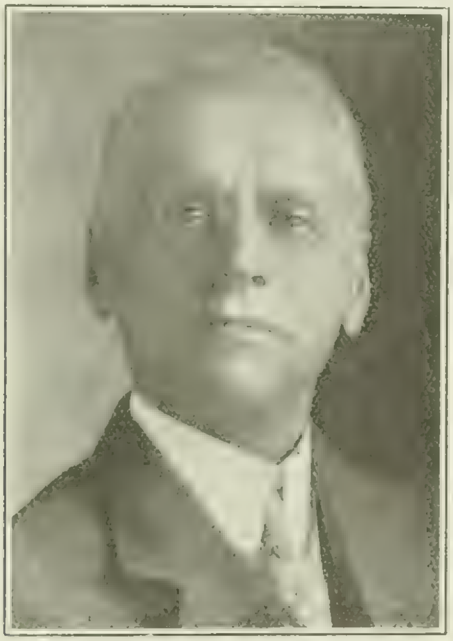
K. M. Cameron, M.E.I.C., Chairman of the Ottawa Branch, presided, and at the head table were many eminent engineers and others, among them being, in addition to the guest of honour, Premier Oliver, of British Columbia, J. B. Hunter, deputy minister, Department of Public Works; Clarence Jameson, Civil Service Commission; G. J. Desbarats, deputy minister, Department of Naval Affairs; George A. Mountain, chief engineer of the Board of Railway Commissioners, all of whom spoke.

Others seated at the head of the table were: D. R. Cameron, A.M.E.I.C., Kamloops, B.C.; H. B. R. Craig, M.E.I.C., London, Ont.; B. H. Fraser, M.E.I.C., chief engineer, Department of Marine; E. A. Cleveland, M.E.I.C., controller of water rights, B.C.; S. J. Chapleau, M.E.I.C., senior engineer, Public Works Department; W. J. Stewart, M.E.I.C., chief hydrographer, Naval Service; H. J. Lamb, M.E.I.C., supervising engineer, Public Works Department, Toronto; Col. W.P. Anderson, C.M.G., M.E.I.C., past president of *The Engineering Institute of Canada;* W. A. Bowden, M.E.I.C., chief engineer, Depart-

ment of Railways and Canals; J. B. McRae, M.E.I.C., consulting engineer; C. R. Coutlee, M.E.I.C., senior engineer, Public Works Department; R.F. Uniacke, M.E.I.C., chief engineer, Department of Justice; U. Valiquet, M.E.I.C., senior engineer, Public Works Department; S. Lelièvre, A. R. Decary, M.E.I.C., supervising engineer, Public Works Department, Quebec; G. Gordon Gale, M.E.I.C., Hull Electric Railway.

Tributes to Mr. St. Laurent, both as an engineer, and as a man, were finely paid by all the speakers. J. B. Hunter remarked that the esteem in which the guest of honour was held went far beyond the circle of government engineers, for he was as highly esteemed among engineers in private practice.

He built to stay, said Mr. Hunter,amid applause. He was a square peg in a square hole, with an emphasis on the square, for squareness was characteristic of the man. His staff was as intensely pleased as he himself when Mr. St. Laurent's appointment was announced.



ARTHUR T. ST. LAURENT, M.E.I.C.
Chief Engineer Federal Department of Public Works

Clarence Jamieson, of the Civil Service Commission, extended felicitation in the well-earned advancement of Mr. St. Laurent in the service. In doing so he made an announcement which emphasizes in a remarkable manner the brotherhood feeling which exists in *The Engineering Institute of Canada.* Mr. Jamieson said he would be betraying no secret now when he mentioned that Mr. Cameron, the chairman, who was in the direct line for promotion to the vacancy, had written the Civil Service Commission stating that he favoured the appointment of Mr. St. Laurent as one well merited and in the public interest. This intimation was cordially acclaimed, and Mr. Cameron, when he was able to secure a hearing, modestly remarked that he was sure every engineer present and similarly situated, and knowing Mr. St. Laurent as he did, would have done the same.

G. J. Desbarats, M.E.I.C., paid his respects in French as a tribute to the nationality of the guest of honour.

George Mountain, M.E.I.C., a past president of the Ottawa Branch, recalled Mr. St. Laurent's services to branch as a former member of the council, and as a past the vice-president of *The Institute,* and he suggested that the members should keep their guest of the day in mind when the time came for the presidency of *The Engineering Institute of Canada* to come to Ottawa.

Premier Oliver, of British Columbia, said engineers had done much in the advancement of Canada, and though there was a lull at the present time seemingly in Canada's development in that respect, he was sure there would still be great opportunities for the engineers of the future. He commented on the fact with pride that the new federal premier had chosen a member of the B.C. government to become minister of Public Works. Mr. Oliver remarked that he had been acquainted with Hon. J. King for nearly 20 years, and he was absolutely incapable of a mean action.

Mr. St. Laurent was loudly applauded on rising to reply to the many felicitations. He was delightfully reminiscent, and caused much laughter by the detailing of some of his early struggles and experiences. He thought he had had a good streak of luck in life and proceeded to demonstrate how, in various crises this element had apparently favoured him. He paid tribute to the "good wife" with whom he had been favoured, and who, he said, was an ideal companion for life, also to his two good boys and two good girls, "no matter if I do say if myself," he added amid laughter and applause. He thanked many present, who, he said, had befriended him in various times.

Referring to the action of the Chairman, K. M. Cameron, to which Mr. Jamieson had called attention, Mr. St. Laurent said he thought there was nothing more noble than this. He could imagine no better evidence of a fine spirit towards a confrere. Mr. St. Laurent said he wished to express to them all his deep gratitude for their expressions and token of esteem. He thought congratulations were due to *The Institute,* that it was one of its members which had been promoted, which augured well for its future recognition.

Mr. St. Laurent was born at Rimouski, Quebec, in 1859. He graduated from the Ecole Polytechnique, Montreal in 1885, and for three years was engaged on the location and construction of the Temiscouata railway. In 1888 he entered the Civil Service and was appointed assistant district engineer at Winnipeg. Returning to Ottawa in 1898 he designed the lock and dam at St. Andrews, on the Red river, north of Winnipeg, and in 1902 constructed the Laurier avenue bridge at Ottawa and the government grain elevator at Montreal.

The engineering features of the investigation into the feasibility of the Georgian Bay canal by the Commission appointed for that purpose was entrusted to Mr. St. Laurent.

In 1908, on the completion of the latter work, Mr. St. Laurent was appointed assistant deputy minister of the Public Works Department, since which time he has been connected with many extensive projects dealing with navigation and harbour and dry dock construction.

With the formation of the Dominion Power Board, Mr. St. Laurent was made vice-chairman. He is a member of *The Engineering Institute of Canada*, of which he was vice-president for three years, also of the American Society of Civil Engineers, the International Congress of Navigation, and is the technical representative chosen by the deputy ministers as a member of the Federal Civil Service board of hearing and recommendation. Mr. St. Laurent was chairman of the Ottawa section of *The Engineering Institute* in 1914.

As successor to E. D. Lafleur, M.E.I.C., recently deceased, Mr. St. Laurent will assume the responsibility for the engineering work of the Public Works Department. This is one of the larger spending branches of the government, and one whose work extends to every point in Canada where Federal public works are carried on. Coming under his supervision is a large staff of capable engineers, who have long worked with him and these confreres with his extensive circle of friends both inside and outside of the civil service will congratulate Mr. St. Laurent upon his well-merited appointment.

BRANCH NEWS

Victoria Branch

H. M. Bigwood, A.M.E.I.C., Secretary-Treasurer.

Manufacture of Coal Gas

On the 6th of February, a paper on "The History and Progress of the Manufacture of Coal Gas" was given by F. J. Kennedy, of the West Gas Improvement Company. The paper was well illustrated by excellent lantern slides.

As a new plant to manufacture gas by the Glover West system of continuous vertical retorts has recently been erected in Victoria, the lecture was of particular interest and resulted in a good attendance.

The history of gas manufacture, from Murdock's time to the present was traced, and the process to be used locally fully described as to operation and recovery of by-products. That the method now adopted is founded on most recent practice was shewn by the fact that over 40 new plants on similar design were in course of erection at various places. Montreal and Vancouver both have such plants in operation.

The meeting was held in the auditorium of the Victoria Chamber of Commerce of which body the Victoria Branch is now a member, and is represented by H. M. Bigwood, A.M.E.I.C., Secretary of the Branch.

It is hoped that by its affiliation with the one organization which is most closely in touch with the business life of the community and also the southern part of Vancouver Island, that both the public and the engineering profession will benefit. It will place at the disposal of the Chamber, and through it, the public, the technical ability and national strength of *The Institute*, while it will bring to the attention of everyone the willingness and ability of the engineers as a professional body to take part in the public life of the community.

Meeting of Association of Professional Engineers

In order that the benefits expected from legislation may be more closely felt, and also in order that the large number of members of the Association of Professional Engineers, residing in or near Victoria, may take a more active part in the administration of the act, a branch of the association, to be known as the Vancouver Island Branch of the association was brought into existance recently at a meeting of local members.

A provisional committee was chosen to conduct the business incidental to the formation of the branch, consisting of E. E. Brydone-Jack, M.E.I.C., (Chairman), P. Philip, A.M.E.I.C., (Chairman of the Victoria Branch, E.I.C.), J. P. Forde, M.E.I.C., H. M. Bigwood, A.M.E.I.C., Secretary, E. N. Horsey, A.M.E.I.C., and ex-officio H. L. Johnston, M.E.I.C., and Geo. Wilkinson, local members of the Council of the Association.

Reception and Dance

On Friday evening, the 24th of February, the Branch will hold a Reception and Dance, to which all members of the profession have been invited. It is to be an extension of the principle under which the lunches have been held and which have brought many members as yet outside the membership of *The Institute* into closer touch with the ideals and aspirations of the national society.

Future Programme

Several papers and visits have been arranged for the immediate future:—

March 8th, F. G. Aldous, A.M.E.I.C., paper on "A surveying expedition into Syria-Damascus to Aleppo—following the British occupation", with lantern slides.

At later dates, paper on "Esquimalt Dry Dock" to be followed by a visit to the work. Paper on "Dredging and River bank protection", by J. P. Forde, M.E.I.C., district engineer for the Public Works Dept. of Canada, and a visit to the new plant of the Victoria Gas Company.

Vancouver Branch

P. H. Buchan, A.M.E.I.C., Secretary-Treasurer.

Meeting of B.C.T.A.

A very personal problem is facing the professional engineers of British Columbia, personal because it touches their pocket-books, in that the multiplicity of fees to the various associations is becoming a burden of no small proportions in these hard times. Common determination to try and alleviate this condition of affairs culminated in a meeting open to all concerned, to discuss the admisability of eliminating at least one of the existing societies — the one named being the British Columbia Technical Association.

The B. C. T. A. was originally called into being for the purpose of providing a body common to engineers and technical men of every branch, which would undertake the work involved in getting a professional act passed in the B. C. Legislature, legalizing the registration of engineers in the Province. Coupled with this main object, was the promotion of mutual fellowship and good-will

among the members of these various branches, and concerted action to increase the remuneration of engineers generally.

Owing to the existence of a body specially formed to administer the act, to which all qualified to practise must belong, it has been felt that the B. C. Technical Association has outlined its usefulness, and should be dissolved. Here, however, a complication arises, in that approximately one hundred of its members have not the qualifications requisite to registration under the act, and it has been arged by many of their more fortunate fellow-members, that the B. C. T. A. should be held together for the benefit of these non-professional technical men. Further, it is widely believed that this body provides a common instrument for dealing with the welfare of engineers generally, in ways which are not within the scope of other engineering organizations.

A large number of those present at the meeting called on February 7th, took part in the discussion, among whom were Mr. Wootton, President of the B. C. T. A., who reviewed the history and objects of his association, and Mr. Brakenridge, Chairman of the Vancouver Branch of the *E.I.C.*, who outlined the scope of *The Institute's* activities as a possible substitute for the B. C. T. A. All the points brought up were carefully discussed, and viewed from numerous angles, so that the opinion expressed by the meeting can be taken as the result of mature consideration of the question.

It was finally moved by W. Brand Young, A.M.E.I.C., and seconded by A. S. Wootton "That it is desirable in the opinion of this meeting that the British Columbia Technical Association continue to function". On a show of hands 18 declared in favour of continuance, 24 declared against. The Chairman declared the motion defeated.

It was then moved by W. G. Swan, M.E.I.C., seconded by W. H. Powell, M.E.I.C., "That this meeting goes on record recommending that an organization be formed along the lines of a General Engineering Council composed of delegates appointed from existing organizations, — to function when concerted action in the interests of all engineers is needed". This motion was carried.

The profession is now awaiting the action of the B. C. Technical Association, and the other engineering bodies concerned in the last resolution.

Visit to Vancouver Gas Plant

Through the kindness of the Vancouver Gas Company, the members of the Vancouver Branch spent an unusually intresting afternoon at the new gas-works on Keefer St., on Saturday 11th February.

This plant is the only one of its kind on the Pacific Coast and the third in Canada, and has been in course of erection for the past eighteen months, having been formally opened by the general-manager, George Kidd, only one month ago. It was designed and built by the West Gas Improvement Company of Manchester, Eng., and embodies the most modern features of economical manufacture of gas and its by-products. The plant has a capacity of one million cubic feet per day, and cost a half-million dollars. The design and construction of foundations, housing, bunkers, etc., has been in charge of A. J. Waters, M.E.I.C., who has been specially employed by the Vancouver Gas Company, as resident engineer.

J. Keillor, gas engineer, and his staff of experts did everything in their power to make the visit an interesting one. Owing to the large number present, which included many student engineers from the University of British Columbia, there were three parties organized, the guides being Messrs. Draeper and Brown of the gas company's engineering staff, and Mr. Punnett of the West Gas Improvement Company. Every part of both the new and old plants were inspected, and the guides were kept fully occupied in answering the steady fire of questions from their interested visitors.

After the inspection, the various parties assembled in the exhauster room, where cigars and very substantial refreshments were served through the kindness of the Vancouver Gas Company. In proposing a vote of thanks, Mr. Brakenridge, Chairman of the Branch, stated that Mr. Keillor was preparing a paper on the plant, which he had very kindly consented to read before a general meeting of the Branch in the near future.

City Tax for Engineers

A recent amendment of the charter of the City of Vancouver has given the City the right to license all professional men practising within its boundaries, irrespective of licenses paid to the Provincial Government. Considerable stir occurred in professional circles recently when the City Council announced the scale of fees it proposed to demand. Deputations at once waited on the Council to present the views and objections of the various professional bodies.

Mr. Brakenridge, Chairman of the Vancouver Branch, appeared in behalf of the engineering profession and although he was not successful in reducing the fee, he did succeed in conjunction with the other bodies, in obtaining the promise of the City Council to have the word "tax" substituted for the word "license", thereby relieving the fundamental objection of professional engineers, that the word "license" would favour evasion of the Professional Engineer's Act, by allowing non-registered parties to practise under protection of the City.

The fee for engineers is $25.00 per annum, to be paid by every engineer engaged in private practice within the City. In the case of a firm with two or more partners, each member pays an individual fee. The profession considers the tax a hardship on the younger members, whose business and clientele are not as extensive as older established firms.

"Toike-Oike" Meeting

The Pacific Coast Branch of the University of Toronto Engineering Alumni Association held its fifty annual dinner in the University Club, Vancouver, on Saturday evening, 28th January. About thirty-five of the eighty-odd members of the Branch were presents including a number from Victoria, New Westminster and Seattle, — a very good turnout considering the way "School men" are scattered up and down the Coast.

The old "School" spirit of camaraderie pernaded the gathering from the outset, and everyone thoroughly enjoyed not only the solid and *liquid* refreshments, but

the songs, choruses, and yells which livened the proceedings. The President of the Branch, W. J. Johnston, A.M.E.I.C., discharged the duties of chairman and toastmaster, the guest of honour being J. H. Kennedy, M.E.I.C., who has the distinction of being the oldest living graduate of S. P. S., and the honorary-president of the Branch.

A very substantial contribution to the merriment of the evening was made by the President "Guiness" Johnston who wrote a song to the tune of "Solomon Levi", featuring W. G. Swan, C. E. Webb, G. P. Stirret and others. The chorus, which was sung with great enthusiasm, led by an excellent quartette, ran as follows:

CHORUS: *"Solomon Levi"*

Oh Engineers, hip, hip, hip, hurrah;
[Oh Engineers, hip, hip, hip, hurrah!
For we're the boys that face the world
[with hearts so light and free,
We're busy morning, noon and night,
[so keen for work are we,
We build the mighty railroads,
[the boats and buildings high,
When there's no work for us to do,
[we'll all lie down and die.

The menu was a departure from the usual formal card, being arranged in the form of a programme for a two-act play, the cover bearing this inscription: "The Engineering Alumni of the University of Toronto, Pacific Coast Branch, in their fifth annual presentation, a revival of the grand "old school" comedy "Toike Oike" in two acts, etc. The menu was blue-printed from a Vandyke negative and tied with gold ribbon, thus combining the "school" colors, blue, gold and white most effectively. The details of the management, cast, etc., aroused no little amusement.

The Branch, though not very strong numerically, has acquired quite a reputation in university circles on the Coast as an active organization. Last summer, it had the honour of entertaining the past president of *The Institute*, J. M. R. Fairbairn, M.E.I.C., at a luncheon in the Hotel Vancouver. Mr. Fairbairn is a fellow "School man" and a very enthusiastic number of the U. of T. Engineering Alumni Association in Eastern Canada. The Pacific Coast Branch has the following members of *The Institute* on its roll:—Members: J. H. Kennedy, W. G. Swan, W. A. Clement, A. L. McCulloch. Assoc. Members: C. E. Cooper, C. T. Hamilton, E. A. Jamieson, W. J. Johnston, R. G. Swan, G. P. Stirrett, E. L. Tait, C. E. Webb, J. A. Walker, A. P. Augustine, D. A. Graham, N. C. Stewart, E. L. Burgess, H. D. Fyfe, P. H. Buchan, W. L. Stamford, N. C. Sherman.

Calgary Branch

Arthur L. Ford, M.E.I.C., Secretary-Treasurer.
Floyd K. Beach, A.M.E.I.C., Branch News Editor.

On Friday, January 27th, at a luncheon in the Hudson Bay Company's tapestry room, the Calgary Branch of *The Institute* and the Alberta Military Institute joined in listening to Dr. R. W. Boyle, dean of the faculty of science and professor of physics at the University of Alberta, in a very interesting address on Rainmaking.

The address was of a popular nature, and was of great interest to everyone living in an arid or semi-arid country where imposters at times endeavour to take advantage of the credulity of the public. The text of his address will appear in an early number of *The Journal*.

In the evening of the same day, Dr. Boyle addressed the Calgary Branch on an electrical subject. There was a good turnout of members and a number of electrical men were guests of the Branch on this occasion.

Convention of Western Association of Building and Contracting Industries.

The Western Association of Building and Contracting Industries met for a two day convention in Calgary, February 14th and 15th. The convention discussed the problems of the various industries represented, looking toward early revival in the building trades, and ended with a banquet very well arranged and followed by an excellent musical programme and after dinner speeches.

The convention was made up of a large number of visitors from Manitoba, Saskatchewan and from other parts of Alberta. An invitation was extended to members of *The Institute*, and a large number of them availed themselves of the opportunity so courteously offered.

Among the members of *The Institute* prominent in the work of the convention were V. A. Newhall, A.M.E.I.C., manager of the local branch of Trussed Concrete Steel Company, who was chairman of the committee on prices of materials, and F. E. Emery, A.M.E.I.C., Alberta representative of the Manitoba Bridge & Iron Works Limited.

Edmonton Branch

R. H. Douglas, A.M.E.I.C., Secretary-Treasurer.

The regular monthly meeting of the Edmonton Branch of *The Engineering Institute of Canada* was held in the Edmonton Board of Trade rooms on Wednesday, January 18th, 1922. The meeting took the form of three 15 minute papers on subjects of local interest, each paper being followed by a 15 minute discussion.

A. W. Haddow, A.M.E.I.C., Edmonton city engineer, gave a brief outline of the organization and workings of the various city services from an engineering standpoint. He also gave a description of the experiments that had been carried on in connection with cinder walks using various types of binder.

Edgar Stansfield, M.E.I.C., of the Industrial Research Department, at the University of Alberta, gave a short account of the work of the Lignite Utilization Board of Canada. In the fifteen minutes allotted to him, he outlined the gradual evolution from small scale laboratory experiments on lignite carbonization, commenced five years ago in Ottawa, to the commercial carbonizers now installed at Bienfait, Saskatchewan. The problems of briquetting were only referred to incidentally. In the discussion which followed, some economic questions of lignite carbonization and briquetting were considered, including the extent to which the work of the Board would assist in solving Alberta's problems. In view of

the high cost of purchased binders, the speaker suggested a type of self-contained plant, in which only part of the product would be briquetted, as one which might succeed in the Province.

In a brief address, Mr. Donaldson, A.M.E.I.C., outlined the route, conditions of grades, economic and social possibilities of the Jasper Highway, proposed to be constructed through the utilization of the portions of railway track abandoned between Evansburg and Hinton where connection would require to be made with Dominion Government roads through Jasper Park to Jasper.

The claims of Edson and its tributary communities for road connection with Edmonton were voiced, the Park as an objective, being for the present, the only justification for progress beyond Edson. Engineers were called upon to interest themselves in this project so that public discussion and action may be based upon a sane realization of the construction requirements of this important work.

The three essentials for consideration and action in this matter are: —

1. The utilization of the beauties and holiday resources of our Dominion Jasper Park now inaccessible, except by rail.

2. The profitable economic consequences to Edmonton, and the area to the West consequent upon a highway being constructed.

3. And lastly, the necessity for securing some return for the enormous outlays in these railways from which constructions, neither income nor service is now derived.

Lethbridge Branch

C. M. Arnold, M.E.I.C., Secretary-Treasurer.

On January 14th, the Lethbridge Branch held a dinner at the Y.M.C.A., at which were present 50 corporate members and affiliates of the Branch. S. G. Porter, M.E.I.C., occupied the chair. At the close of the dinner popular songs were sung and some of the members gave songs and violin solos.

H. B. Muckleston, M.E.I.C., read a paper entitled "Actuarial Factors in the Design of Irrigation Structures", which has been sent to the *Journal.*

The Chairman announced that the Branch membership at present was as follows: 7 members, 23 associate members, 3 juniors, and 17 affiliates of the Branch. This includes applicants recommended for election by this Branch.

On January 28th, the Branch held another general meeting and dinner at the Y.M.C.A., at which 45 were present. S. G. Porter, M.E.I.C., in the chair. After a short musical program, G. N. Houston, M.E.I.C., gave an address on the "Manufacture of Smokeless Powder and the Construction of the Plant at Nitro, W.Va., U.S.A., The address was fully illustrated by lantern slides, and was very interesting to all. At the close of the address discussion followed, and the number of questions asked was evidence of the interest taken in the subject.

On February 11th, the members of the Branch again gathered for a general meeting and dinner at the Y.M.C.A., the number present being 37, this attendance being smaller on account of severe cold weather. As an indication of the interest shown it may be mentioned that one member walked six miles to the train, and another rode a saddle horse three miles in weather 25 below zero, to attend this meeting, both repeating the trip at 2.30 in the morning on the return.

G. N. Houston, M.E.I.C., occupied the chair, in the absence of the Chairman, S. G. Porter, M.E.I.C. C. D. MacKintosh, A.M.E.I.C., addressed the meeting, the subject being "The Evolution of Transportation". The speaker began with the history of the initial development of transportation — passing on to the phases of railway reconnaissance, location and construction, and closing the address with a number of personal reminiscences which led to a general discussion and further reminiscences from a number of those present.

Winnipeg Branch

Geo. L. Guy, M.E.I.C., Secretary-Treasurer.

Welding

At a meeting of the Branch held in the University Buildings on the 2nd February, E. P. Fetherstonhaugh, M.E.I.C., in the chair, two papers on Electric and Oxy-acetylene Welding were read. The electrical paper was read by J. M. F. Wilson, A.M.E.I.C., and the oxy-acetylyne paper by Mr. Brown of the Liquid Air Company.

Mr. Wilson covered the field of electric welding very completely, dealing with both the theoretical aspects and the practical application, and discussed very fully the different methods and equipment at present in use. He pointed out that electric welding had now got to the stage where it was being systematically investigated and he hoped in the near future that definite rules and practice would be evolved which would do away with many of the different methods at present in use, claims for which were not always based on accurate engineering knowledge.

A very live discussion on the papers took place, which was contributed to by several gentlemen who were actively engaged in the welding field. The discussion brought out the very pronounced differences of opinion which are at present held on the merits of the different methods of welding and some of the speakers did not hesitate to claim the superiority of the methods which they were familiar with, although from a general view of the discussion it was obvious that all methods at present in use had their particular field.

The Chairman tendered the congratulations of the Branch to J. G. Sullivan, M.E.I.C., on his selection to presidency of the Institute

It was decided to appoint a Committee to look after the interests of the engineering profession in view of the proposed Income Tax and other tax bills at present before the local Legislature.

Illumination

A meeting of the Branch was held at the University Buildings on the 16th February, E. P. Fetherstonhaugh, M.E.I.C., in the chair.

A paper was read by Professor Fetherstonhaugh on the measurement and calculation of illumination. The paper was illustrated by diagrams, and the speaker very fully discussed the calculation and measurement of

illumination, both on a theoretical and practical basis. By means of different types of photometers, the actual measurement of illumination was clearly shown, and the advantages of the different types of instruments were explained. At the close of the paper, an active discussion took place, in which many points were brought out of interest to the members. The question of proper illuminating codes was also discussed.

Among the business for the evening, was a report from the Committee who were instructed to co-operate with the Citizens Committee in protecting against the provincial income tax. The chairman reported progress, stating that the Committee had attended the general meeting of protest held in the Board of Trade building, and that a sub-committee had been appointed representing the various interests in the city, one of the members of *The Institute* having been placed on this Committee. The report was received and adopted, and on a motion the Committee were instructed to co-operate with the General Committee of Citizens in every way possible to promote the effective administration of the Province and the reduction of capital and operating expenditure in the near future. This motion brought up a vigourous discussion, during which active criticism was made, both for and against the motion. The motion eventually carried by a large majority.

Members of the Branch were invited to attend a moving picture exhibition under the auspices of the C. O. T. C., showing the work of the air force in Canada. A large number of members attended and were well repaid by the interesting nature of the pictures.

A notice of motion was given that at the next meeting a committee should be appointed to fully consider the question of the province, taking over its natural resources and particularly to investigate the position of the Province with respect to its water power resources, with a view to leaving these resources in the control of the Federal Government, on account of the able and efficient manner in which the water power of the province had been administered and investigated by the Water Power Branch of the Dominion Government.

Border Cities Branch

J. Clark Keith, A.M.E.I.C., Secretary-Treasurer.

The regular monthly meeting of the Border Cities Branch was held in the Cadillac Cafe on Friday the 10th inst. at 7 o'clock, twenty members being present.

J. E. Porter, A.M.E.I.C., reported for J. J. Newman, M.E.I.C., Ontario Provincial Division Representative, on the progress being made toward the securing of legislation for engineers in Ontario at the present session of the Legislature.

J. Clark Keith, A.M.E.I.C., briefly stated what had been accomplished at the meeting of Branch Secretaries held in Montreal, at the time of the Annual Meeting. The detailed report of the meeting was still in the hands of the executive and it would be brought to the attention of the Branch at an early meeting.

L. McGill Allen, A.M.E.I.C., gave a very interesting address on "The Placing of Concrete under Various Conditions". He dealt with the developments in the placing of concrete from the time of the old mixing board to present day efficient mechanical equipment. The relative merits of and objections to the spouting system were discussed with relation to economy in handling coupled with the nature of the structure on which the concrete was being placed. The methods of placing concrete under water were handled in detail as a result of the speaker's personal experience on dams at Sherbrooke and Murray Bay, Que., the general method being followed of allowing the concrete to flow from one end of the form to the other, and not by being deposited in layers along the full length of the form. The construction of an addition to the Ford Motor Company's plant in water varying in depth from 13 to 20 feet was of particular local interest.

The paper produced much desirable discussion, and almost every member gave his personal experience. D. A. Molitor, M.E.I.C., explained the construction of the walls of the Toronto Harbour Commission, stating that although monolithic construction was opposed by the contractor on the ground that inferior work would result, actual results showed it to be superior to block construction. Doubt was also expressed during the construction of the Sault Ste. Marie locks as to the under water concrete but it proved on laboratory test to be superior to that laid above. W. H. Baltzell, M.E.I.C., related his experiences with slow setting concrete and blast furnace clay. Laboratory tests were shown to be entirely unreliable in some special instances, but the value of such tests was fully appreciated.

A hearty vote of thanks was tendered the speaker for his address, resulting as it had done, in so much general information being elicited.

Niagara Peninsula Branch

Rex P. Johnson, A.M.E.I.C., Secretary-Treasurer.

The January dinner meeting was held at the Welland Hotel, St. Catharines, on the 18th of the month, with an attendance of only twenty-four.

In the absence of the Branch Chairman, on a business trip to the Western States and California, the Vice-Chairman, F. S. Lazier, M.E.I.C., presided. Mr. Lazier gave a short outline of some of the recent work of the Executive Committee, and the Branch representative on the Executive of the Ontario Provincial Division, presented a verbal report on a recent meeting of the Division which had to do with process and recent developments in legislation. In this connection, the Branch was advised that certain opposition had developed among the mining communities in Northern Ontario, and an explanation of the means taken to meet this opposition and its possible effects, were announced to the meeting.

Messrs. A. Milne, M.E.I.C., and W. H. Sullivan, M.E.I.C., advised that they had each interviewed respectively Messrs. Greenlaw, M.P.P. of St. Catharines and Cooper, M.P.P. of Welland, in regard to the "Act Respecting Professional Engineers" which is to again come before the forthcoming session of the Ontario Legislature. It developed that Mr. Greenlaw is very much opposed to the Bill, and that Mr. Cooper was reticent and non-committal regarding his views on it.

The business part of the meeting was followed by an interesting, illustrated talk by J. W. Purcell, A.M.E.I.C., on the subject of "Rural Power Distribution in Ontario from the Hydro Lines". The speaker gave the members a very thorough and comprehensive idea of the uses of electric power on the farm and explained the methods of application, difficulties of distribution, cost data and power rates, and the nature and extent of preliminary studies and educational work necessary to constructing a rural line.

The February meeting of the Branch was held on the 15th of the month, at the Lafayette Hotel, Niagara Falls, Ontario, with an attendance of forty. The mayor and city council, and the Chairman of the town planning committee were present as guests of the Branch, and members of the Rotary Club were present. After enjoying a very good dinner, followed by a lusty use of the song sheets and a brief report by the Secretary on the recent meeting of Eastern Branch Secretaries at Montreal, the Chairman introduced H. L. Seymour, A.M.E.I.C., whose subject was "Town Planning with particular reference to Niagara Falls and Vicinity". The speaker outlined recent progress in this subject and showed that a large number of Ontario towns and cities are actively engaged on planning work. Legislation governing municipal control of lands, buildings and property was outlined, and the speaker then described, with lantern views, many details and phases of his subject in different places and the application of town planning principles to Niagara Falls. A hearty vote of thanks was tendered to the speaker at the close of his address.

Messrs. Acres, Blanchard and Johnson attended the Annual and Professional meeting of *The Institute* in Montreal on January 24-26. Vice-President Acres conducted the business session on the afternoon of the first day, and addressed a very large meeting of the Montreal Branch on the evening of the third day. His subject was "The Queenston-Chippawa Power Development", illustrated with slides and motion pictures.

Councillor Blanchard addressed the Kingston Branch on the same subject, the day before the Annual Meeting.

The Branch Secretary attended an all day conference of Eastern Branch Secretaries, held coincident with the Annual Meeting. This meeting is a new feature of *Institute* activities, and resulted in much benefit to those in attendance, and will be of material benefit to all the Branches represented.

A meeting of the Executive of the Ontario Provincial Division was held coincident with the Annual Meeting. This Branch was well represented by the attendance of the above mentioned three members.

The Branch Chairman has returned from a business trip to the Western States and California in connection with a number of water power developments.

Hamilton Branch

W. F. McLaren, M.E.I.C., Secretary-Treasurer.

A meeting was held in the Royal Connaught Hotel, 27th. January 1922, to hear an address by T. H. Hogg, A.M.E.I.C., asst. hydraulic engineer with the Hydro-Electric Power Commission of Ontario, on the proposed St. Lawrence River Power Development.

Mr. Hogg stated that while navigation of rivers in Canada came under the jurisdiction of the Dominion Government, the power rights belong to the province and it was for this reason that the Hydro-Electric Power Commission, representing the people of Ontario through the provincial government, had offered schemes for power development to the International Joint Commission. About 1912 the Hydro-Electric Power Commission commenced making observations of river level and flow and later carried out extensive surveys and diamond drill borings, and were therefore in a position to present a complete proposition based on thorough study.

The deep waterways scheme naturally divides itself into three zones. Two of these, from Montreal Harbour to Lake St. Louis and from Lake St. Louis to lake St. Francis are entirely within the Province of Quebec. The third, from Lake St. Francis to Lake Ontario is the International reach of the river between Ontario and the State of New York. It is only with this third section that the Hydro-Electric Power Commission deals in its proposals for power development.

The fall from Lake Ontario to Lake St. Francis at Cornwall is 92 feet, of which 84 feet may be used for power. From Cornwall to Montreal there is a fall of 134 feet, making a total fall from Lake Ontario to Montreal of 226 feet, of which about 180 feet is available for power development. About four million horse-power may be developed from the St. Lawrence as compared with three million from Niagara, the difference being due to the necessity of preserving the Falls.

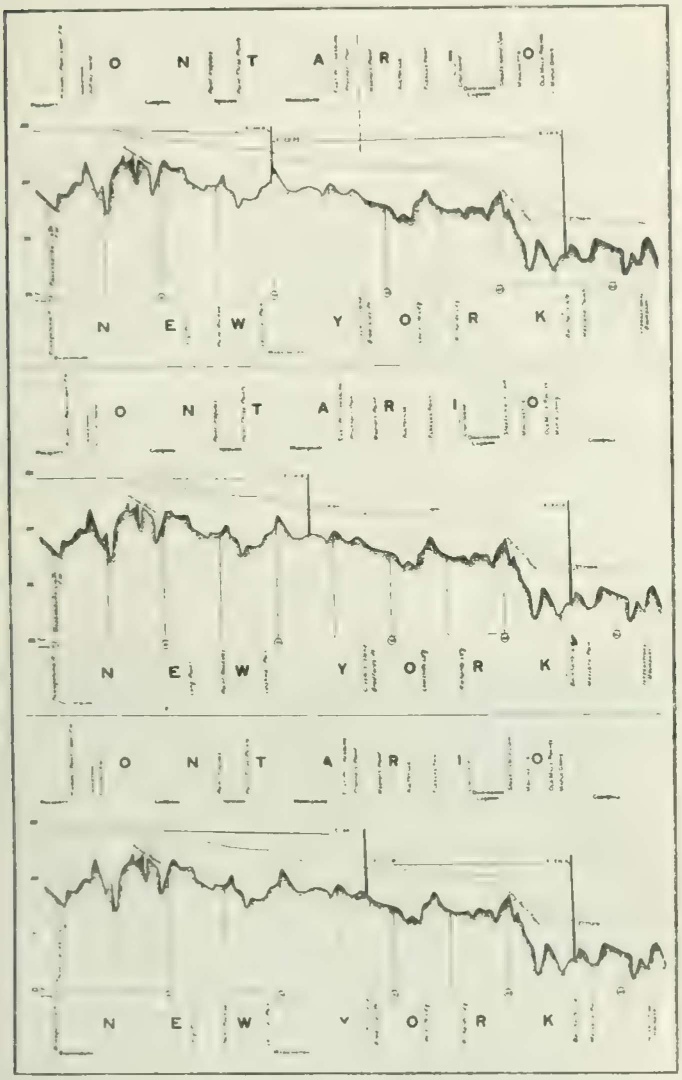
By treaty Canada has the right to use 36,000 cu. ft. per second for power development on the Niagara river and the United States 20,000. New development under construction on the American side will require an additional 10,000 cu. ft. per second and altogether to supply present developments and those under construction 84,000 to 94,000 will be required out of an available 100,000 to 110,000 cu. ft. per sec. The complete permissible development is thus being approached at Niagara Falls.

One of the great advantages of the St. Lawrence river for power development purposes is its uniformity of flow, which varies from 320,000 to 190,000 cu. ft. per second, a ratio of less than 2 to 1. This low ratio is very striking when compared with other large rivers on the continent, as, for example, the Ottawa with a ratio of maximum to minimum flow of 25 to 1, the Columbia 27 to 1, and the Susquehanna 200 to 1.

The so-called Super-Power Zone, which extends along the Atlantic Seaboard from Portsmouth, N.H. to Washington, D.C., and about 150 miles inland uses 9,000,000 H.P. and is adding 275,000 H.P. each year by steam engines. This district will provide a market for surplus power from the St. Lawrence. New York City is 300 miles from the proposed development, the same distance as Hamilton, an economic transmission distance in consideration of the other available sources of energy for the district, and the cost of development and transmission. Transformation and transmission of power for a distance of 300 miles in blocks of 100,000 H.P. costs about as much as the production of the power at the power site. Power costing $15.00 per H.P. per year at the development would cost about $30 per H.P. year at New York or Hamilton. It is quite possible that eventually Lake

Ontario will be completely encircled by transmission lines connecting the existing systems and joining the two primary sources of power on the Niagara and St. Lawrence.

It will be possible to develop 1½ to 2 million H.P. on the International reach of the St. Lawrence and thus save 35,000,000 tons of coal per annum, half of this being for the benefit of Canada and half the United States. The present Canadian Plants at Niagara develop 425,000 H.P. and the Queenston Development brings this up to 1,000,000 H.P.



Scheme A of the Hydro-electric Power Commisson of Ontario; would flood 29,000 acres valuable land.

Scheme B—A two stage development with many advantages.

Scheme C—Another two stage development but open to many objections.

The Hydro-Electric Power Commission in its report on the St. Lawrence Development suggests three schemes for power development. Scheme A. is a single development by a dam at Barnhart Island above Cornwall, where an effective head of 74½ feet may be used. Scheme B. is a two stage development with power dams at Morrisburg and Barnhart Island, the head at the former being 28 feet and at the latter 54 feet. Scheme C. is a modification of Scheme B, the upper dam being located at Crysler Island about five miles downstream from Morrisburg.

By Scheme A, 1,500,000 H.P. could be developed and by Schemes B. and C, 1,600,000 H.P.; The cost per H.P. of the initial portions of these developments varying from $124 to $127 per H.P. Thirty thousand acres of land would be affected by flooding in Scheme A. and 6,000 and 11,000 respectively by B. and C. The cost of the complete development would be $60,000,000 for the navigation works and $150,000,000 for power, a total of $210,000,000.

In Scheme B. the initial development would consist of 600,000 H.P. developed at the upper dam from units of 10,000 H.P. capacity each, running at 100 r.p.m., installed in a power house nearly a mile long; a little more than half of this would be on the Canadian side to compensate for water taken by the Chicago Drainage Canal. At the lower dam where 1,000,000 H.P. would be developed units of 25,000 H.P. each, at 100 r.p.m., are proposed.

A 30 ft. depth is proposed for the navigation channels. In Lloyd's Register for 1918-19 over 80% of the steamships listed had drafts of 25 feet or less, and over 99% draw 30 feet or less. A 30 ft. draft would accommodate all ocean going vessels except the large modern liners.

The accompanying river sections show the 3 schemes submitted. The first is very similar to that proposed by the government engineers while the 2 stage developments are very similar to that proposed by the New York and Ontario Power Company.

The address was illustrated by slides.

Following the address, the paper was discussed by Messrs. W. S. Connolly, H. B. Dwight and F. W. Paulin. It was brought out in the discussion that the high speed of units could be obtained with a new type of waterwheel recently designed. This type has a very high runaway speed, namely 150% above normal. It is estimated however, that this would only improve an increase of 15% in cost of generators which is more than offset by the reduction in size of unit, due to the higher operating speed.

A hearty vote of thanks closed a most instructive evening, with an attendance of about 100. The chair was occupied by E. H. Darling, M.E.I.C., who announced that the next meeting would be on 16th February, when Prof. Durley would address the Branch on Standardization. Prof. Durley has recently returned from Europe where he studied industrial conditions.

Toronto Branch

F. B. Geodike, M.E.I.C., Secretary-Treasurer.
C. R. Young, M.E.I.C., Branch News Editor.

Incineration

At the meeting held on January 26, the subject of Incineration was discussed in an illustrated address by R. R. Knight, M.E.I.C., engineer and manager for Francis Hankin & Co., Ltd., Toronto.

Mr. Knight outlined the various types of incinerators and destructors used for the disposal of garbage, pointing out the relative advantage of each. The most suitable type of equipment was that which utilized the fuel value of the garbage itself to carry out the destruction. An average of about one-fifth of a ton of garbage per capita per annum may be assumed from a large community, and since one pound of garbage may be considered as capable of evaporating a pound of water in addition to the three-quarters of a pound present in the garbage, the heat value of this material is evident. Mr. Knight stated that it possessed about one-quarter of the calorific value of a poor coal.

According to the speaker, the commercial utilization of the various constituents of garbage was impracticable for cities of less than one-half million in population. Similarly the destruction of garbage by incineration was not feasible without the use of added fuel for cities of less than 15,000 population.

Previous to the address, J. M. Oxley, M.E.I.C., made a formal motion for certain amendments to the by-laws of which he had given notice at the previous regular meeting.

Ashburnham Bridge, Peterboro

On account of the illness of S. R. Cound, of the Baldwins Canadian Steel Corporation, he was unable to give his address on February 2, on the plant of that company, as provided in the program. In his stead, Frank Barber, M.E.I.C., gave an illustrated address on the new Ashburnham Bridge, Peterboroo. This is a reinforced structure containing the longest arch span in Canada. C. J. Townsend, A.M.E.I.C., of the Russel Townsend Construction Co., who were the contractors for the bridge, also contributed to the discussion.

At the meeting of the Executive held on the same evening, the Secretary was requested to write the city authorities asking that all street names be illuminated.

It was also decided that a letter be sent to various prominent engineers in this district, urging them to exert their influence with local members to secure the passage of the Professional Engineers' bill, now before the legislature.

Fertilizers

R. W. Perry, of Gunn's, Ltd., not being able to give his address on "Side Lights on the Packing House Industry", on February 9, H. G. Bell, of the Canadian Fertilizers Association, kindly addressed the Branch on "Fertilizers". He pointed out the various valuable constituents of these materials, and traced their effect on the crops. The commercial importance of replenishing the soil was graphically stressed by Mr. Bell.

John T. Farmer, M.E.I.C., Vice-Chairman of the Montreal Branch, was present at the meeting, and conveyed the greetings of that Branch to the Toronto members. He was requested to convey to the Montreal Branch similar greetings from Toronto.

Rail-Carbon Steel

At the meeting of February 16, the Branch heard a very valuable illustrated address by J. B. Carswell, A.M.E.I.C., president of the Carswell Construction Company, Ltd., on "Rail-Carbon Steel".

Mr. Carswell traced, at some length, the origin and quality of the steel from which rail-carbon steel bars are manufactured. He pointed out that steel rails are normally manufactured from a high quality of material, and that there is small likelihood of defective material being used from this source for reinforcement bars. He stated that the average age of the rails now being employed for such manufacture is about eleven years.

The use of a material somewhat higher in carbon than structural grade was defended by Mr. Carswell on the ground that there is a great cushioning effect in the concrete, so that little shock is applied to the bars He thought that it was entirely practicable to take advantage of the higher elastic limit of such material.

So rigid is the inspection of the materials purchased for reinforcement bar manufacture, that there is little likelihood of defective material being used. Even more effective, said the speaker, is the automatic test that arises when a rail with a piped head is led into the rolls. The head will open out and jam in the guides, so that the whole process comes to a standstill until the rolls can be cleaned and re-set.

Mr. Carswell pointed out that rail-carbon steel has been used successfully on the Panama Canal, the shiplock at New Orleans, the Parliament Buildings, Ottawa, the large terminal elevator, at Port Arthur, and in many other structures.

J. M. Oxley, M.E.I.C., in opening the discussion, pointed out that sometimes large quantities of rails are rejected because of high phosphorus content or other defects, and wished to know if there might not be a danger of such material being manufactured into reinforcement bars. He asked if cracks which occurred in this material might not elude inspection, and later in the structure cause a breakdown.

Wm. Storrie, M.E.I.C., asked if there were any appreciable difference in the strength of bars rolled from the head, the web, or the flange of the rail.

T. D. Mylrea, A.M.E.I.C., pointed out that even with high carbon steel the shock attending the punching of holes in concrete ships did not break the steel rods. He thought that the cushioning effect of the concrete was an important protective agency against the breakage of brittle steel.

R. O. Wynne-Roberts, M.E.I.C., wished to know concerning the influence of the growing tendency to use open hearth steel in rail manufacture.

O. W. Ellis, Department of Metallurgy, University of Toronto, pointed out that segregation was most likely to occur at the base of the rail head and hence bars rolled from the head would more likely be defective than those rolled from other portions of the rail.

Mr. Carswell, in reply to the comments, stated that it was possible for a large purchaser to select the particular class of rail from which his reinforcement bars would be rolled, although this would add to the cost. He regretted that the economic situation during the war had resulted in the rolling of some material from munition discard steel. However, this no longer was possible. He thought that one test for each ten tons of material was scarcely enough. The highest ultimate strength, disclosed in a series of 90 tests cited by Mr. Carswell, was 109,000 lb. per sq. in.,

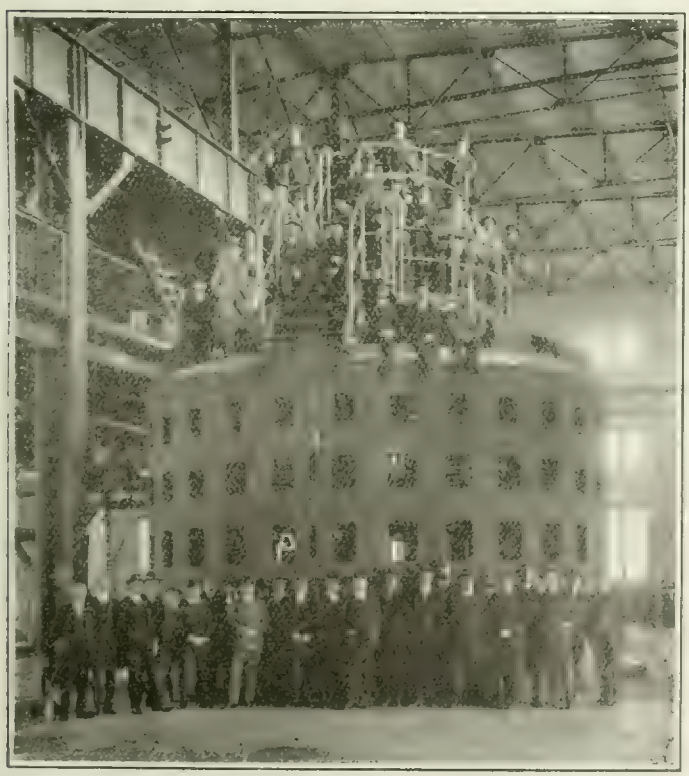
and the lowest 51,000 lb. per sq. in. Probably 90 per cent. of the tests ran from 55,000 to 75,000 lb. per sq. in. The larger bars showed lesser strength to the extent of 7 or 8 per cent. and consequently the manufacturers do not roll bars as a rule higher than 1¼ inch. Mr. Carswell stated that the use of open hearth steel for rails constituted in no sense the criticism of rail carbon steel reinforcement.

Peterborough Branch

D. L. McLaren, A.M.E.I.C., Secretary-Treasurer.

Visit to Canadian General Electric Company's Plant

Through the courtesy of our fellow member E. G. Patterson, general superintendent of the Canadian General Electric Co., the members of the local Branch paid a visit to the factory of the C. G. E. Co., and inspected one of the ATB-16-45000-187½-12000 volt generators which are being built for the Queenston plant of the Hydro-Electric Power Commission of Ontario. This development is being watched with interest by engineers throughout the continent. Below is given a picture of the machine as assembled in the factory. The picture is interesting to engineers in view of the fact that after the machine is installed, only that part of the machine from the stairway up will be visible. This, of course, is due to the type of power house construction.



Peterborough Branch Visit to Canadian General Electric Work.

Silent Knight Engine

On January 26th, a very interesting address was given by J. R. Marlow, general sales manager of Willys-Overland, Toronto, on the "Silent Knight Engine".

The speaker traced the development of the Knight engine from the time of Mr. Knight's earliest experiments in 1902-03, when he evolved the idea of an internal combustion engine which would be silent in operation as compared to the generally used variety of popper or mushroom valve type, up to the present well known "Silent Knight Engine", with its unparallel performance record.

The first engine was built about 1903, and wonderful results obtained. It was not, however, until Mr. Knight's association in 1908, with the Daimler Motor Car Co., of Coventry, England, that any real progress was made. The gruelling tests made at that time under Mr. Knight's

supervision are now matters of history, and have never been even attempted by any other engine manufacturers. Two engines were placed on the test blocks and run for six days continuous with wide open throttle. Each was then placed in a chassis and run for over 2000 miles on the track at an average speed of over 42 miles per hour After that, the engines were again placed on the test blocks, and run for another six days continuous, and as characteristic of the Knight, found to be delivering more power at the end of the run than at the start. The engines were then pulled down for examination and found to be remarkably clean and free from carbon, and to exhibit scarcely any traces of wear.

At the close of the address, two rolls of film were shown. These were obtained by P. P. Westbye, through the courtesy of the C.P.R., and were entitled: "A Party at the Top of the World", and "Discovery of the French River". These were beautiful scenic views and much appreciated.

The Construction of Permanent Highways

The regular meeting for the month of February, was held on the 9th of the month. H. S. Van Scoyoc, of the Canada Cement Company, Montreal, and formerly chief engineer of the Toronto-Hamilton Highway, gave an address on "The Construction of Permanent Highways".

The speaker discussed road construction and stressed the importance of permanent construction. He dwelt on the success of the Hamilton Highway, and he pointed out that while the first cost had been far greater than macadam, the upkeep of macadam was many times greater. Concrete paved roads paid for themselves, he declared. The average cost of maintenance of concrete roadway on the highway in 1921, was about $72.00 a mile, while the macadam would cost about $6,500.

Motion picture films were used to illustrate the address. The latest types of construction machinery were shown in operation, and the Hamilton Highway was viewed from airplane and automobile, and the development along it clearly shown.

Kingston Branch

L. T. Rutledge, M.E.I.C., Secretary-Treasurer.

A regular meeting of the Kingston Branch was held on January 10th, at which Col. Anderson, of the Royal Military College, Kingston, gave an address on the work of the Imperial Staff College, London, England. The Staff College is an army officers' college, at which many officers from all parts of the British Empire attend, to be instructed in the science of modern warfare. One of the great benefits as pointed out by the speaker, is the fact that it brings together from all over the world, men whose views may be quite divergent and it serves as one of the bonds of unity for the Empire.

The next meeting was held on January 23rd, at which meeting A. C. D. Blanchard, M.E.I.C., gave an interesting and instructive lecture on the "Queenston-Chippawa Development", recently completed. The paper was illustrated with numerous slides which showed the construction work in all its stages. Mr. Blanchard, who was a field engineer on the work from the beginning, showed himself to be well acquainted with every detail of the big job, and he indeed brought the canal right to us. In fact, when shown every important detail in the gradual development by such excellent slides, it seems that more can be learned from such a discussion than if a hurried visit was made to the ground itself. The Branch is very much indebted to Mr. Blanchard for his excellent lecture, and the discussion that he aroused.

The last regular meeting was held on February 14th, when Col. J. Schmidlin, director of civil engineering at the Royal Military College, gave an illustrated lecture on "Aerial Surveying". Colonel Schmidlin traced the developments of aerial surveying by means of photography from a time previous to the advent of the aeroplane. The speaker then proceeded with a history of the improvement in cameras for this class of work. He stated that cameras of from 10 to 12 inches focal length are considered the best for photography from great heights. The cameras in use at the present time are almost automatic in action, and one roll of film admits of approximately one hundred photographs being taken with one loading of the camera. The speaker then dealt with the effect of varying altitude, with the variations in elevation of the ground surface and tilting of the camera due to the motion of the moving aeroplane. It was quite clearly pointed out that almost every aerial photograph was a distorted view of the true ground surface, being due to the fact that the photograph is a projection on a plane not parallel to the true horizontal plane. To remove the distortion various methods are employed. The more common method of doing this is by a geometrical or graphical method, using three points whose location and distance apart on the ground are known. A map is constructed from many photographs which overlap one another when taken. These photographs are cut to size and pieced together to form a map which is called a mosaic.

Aerial photographs of country covered with forest are not very clearly cut views. Trees cast shadows and it is difficult to distinguish the shadow from the object. It is commonly imagined that aerial surveying is the only method of surveying vast tracks of any unexplored country in Canada, but as these tracts of land are usually covered with trees, it is apparent that such a method does not prove itself as being the best method. However, aerial surveying of lakes and rivers give very accurate outlines. If the land to be surveyed is covered with many lakes and rivers, aerial surveying was pointed out to be an efficient and cheap method of doing the work.

Colonel Schmidlin outlined what has been done in Canada in aerial photography. He very carefully outlined the probable future of it. A very interesting discussion followed his lecture.

The Kingston Branch wish to report that its membership has lately been increased by approximately 90 new members, the majority of whom are student members.

Ottawa Branch

F. C. C. Lynch, Associate E.I.C., Secretary-Treasurer.

Engineers' Ball

Under the distinguished patronage of Their Excellencies the Governor-General and the Lady Byng of Vimy, Ottawa Branch entertained on the evening of January 26th, at the Chateau Laurier, at a charmingly arranged ball. Mr. and Mrs. K. M. Cameron, Mr. and Mrs. G. A.

Mountain, Mr. and Mrs. Gordon Grant, and Mr. and Mrs. J. B. McRae, received the guests at the entrance of the foyer. Each hostess wore a corsage bouquet of roses and violets, the gifts of the members of the committee.

A splendid orchestra provided lilting music for the dancing. Some of the guests played bridge in the Tudor room, and the banquet hall was used as a smoking room and for the serving of fruit punch. Supper was at 11.30 downstairs. The tables were daintily adorned with spring flowers.

Those who made the arrangements for this enjoyable event were J. B. McRae, M.E.I.C., O. S. Finnie, M.E.I.C., Philip Sherrin, J. L. Rannie, Col. A. F. Duguid, Commander C. P. Edwards, M.E.I.C., K. M. Cameron, M.E.I.C., assistant chief engineer of the Public Works Department, was chairman of this committee.

Among guests from out-of-town were J. M. R. Fairbairn, D.Sc., M.E.I.C., of Montreal, last year's president and Mrs. Fairbairn, Mr. and Mrs. Amyot, of Montreal, Mr. and Mrs. Gibault, of Quebec, Mr. and Mrs. J. M. Wilson, Mr. and Mrs. Cousens, Mr. and Mrs. Roy Millar, all of Toronto; M. J. Murphy, A.M.E.I.C., of Moncton, N.B.; Mr. Hal McGiverin, K.C., M.P., and Mrs. McGiverin, Mr. E. R. E. Chevrier, M.P., and Mrs. Chevrier, and Mr. and Mrs. A. E. Fripp, Senator and Mrs. Bostock, were also among the guests.

Local News

Among the members of the Ottawa Branch who attended the Annual Meeting at Montreal, were Messrs. K. M. Cameron, J. B. Challies, T. H. G. Clunn, M. F. Cochrane, A. A. Dion, G. B. Dodge, C. P. Edwards, O. S. Finnie, G. G. Gale, A. B. Lambe, F. C. C. Lynch, D. W. McLachlan, G. A. Mountain, N. J. Ogilvie, E. Viens, W. C. Way.

Thomas E. McGrail has been elected an associate member of *The Institute*, and Major D. L. McKeand an associate. S. D. Fawcett and R. M. Stenhouse have been transferred from juniors to associate members of *The Institute.*

The Battle of Jutland

A record attendance featured the luncheon on February 10th, at which the chief speaker was paymaster Commander W. H. Eves, R.N., who dealt in a graphic manner with the famous battle of Jutland. Commander Eves went through the battle in H.M.S. Royal Oak, super-dreadnought, and in his capacity as officer in charge of her coding office, was in intimate touch with the development and progress of the battle. His address was listened to with rapt attention, and was admirably illustrated by large charts showing the various dispositions of the rival fleets.

K. M. Cameron, M.E.I.C., Chairman of the Branch, presided, and seated at the head table with the chairman and guests of honour were, among others: Major-General J. H. McBrien, Brig.-Gen. McNaughton, G. J. Desbarats, C.M.G., Hamnet P. Hill, M.P.P., Col. W. P. Anderson, C. H. Keefer, Commander C. P. Edwards, C. A. Magrath, Hugo Craig, Captain Hose, G. A. Mountain, Admiral Sir Charles Kingsmill, J. B. Challies, and G. B. Dodge.

Commander Eves referred to some of the criticisms that had been levelled both at Admiral Jellicoe and Admiral Beatty with regard to their tactics. He remarked, however, that their decisions had to be lightning ones, and he caused some laughter when he remarked that, unlike some of their critics, they did not have time to sit down and smoke a pipe while arriving at a decision as to the best thing to do under the rapid and continually changing conditions. Jellicoe's deployment needed no justification from him he said; the testimony of the German commander, Admiral von Scheer, was sufficient. Jellicoe had threatened his whole line he said, with the result that the German admiral turned tail and ran for it, or, as the text books described it, he "made a strategic retreat to the rear", said the commander, amid considerable laughter.

As regards Beatty's alleged impetuosity, Commander Eves quoted, in refutation, from Beatty's own despatch where the admiral said: "I did not consider it desirable or proper to engage the enemy in the night."

The speaker said that night and bad visibility robbed Jellicoe of full victory, but the only time after that the German fleet ventured out to sea was to follow a single British cruiser and to surrender to Admiral Beatty.

Dominion Land Surveyors' Annual Meeting

The Dominion Land Surveyors' Association was organized in 1882, and since that time has received the full support of the Dominion Land Surveyors throughout Canada. The present Dominion Land Surveyors' Association is a reorganization of the old association, which took place in 1907. The purposes of the association have, however, been continued throughout.

The annual meeting was held at Ottawa on February 1 and 2, and was opened with an able address by the President, G. H. Blanchet, A.M.E.I.C. The Secretary-Treasurer, W. L. MacIlquhan, submitted a very satisfactory financial statement and report. On January 1, 1922, the membership was 227. M. D. McCloskey, read a report on "Land Settlement"; W. M. Dennis, A.M.E.I.C., reported on recent progress in geodetic surveying, and G. H. Herriot, M.E.I.C., reported the progress made in town planning in Canada in 1921.

Capt. Forster, of the Parks Branch of the Department of the Interior, delivered an address on "Our National Parks", followed by Hoyes Lloyd, M.A., also of the Parks Branch, with an interesting talk on "Bird Sanctuaries".

Purely technical papers were presented by L. T. Bowes, of the Naval Service of Canada, on "Hydrographical Surveying and its application in James Bay", and by M. P. Bridgland, of the Topographical Surveys Branch of the Department of the Interior, on "Phototopographic Surveying". Mr. Bridgland exhibited some of the finest lantern slides of mountain scenery ever seen in Ottawa. F. V. Seibert, A.M.E.I.C., Topographical Surveys Branch, gave a talk on "A Trip from Peace River to the Fort Norman Oil-fields", illustrated by many fine slides.

The closing address was given by J. A. Wilson, A.M.E.I.C., Secretary of the Air Board, and covered in a very complete manner the work of the Air Board in

Canada. The annual luncheon was held at the Chateau Laurier, 125 being seated. Hon. Charles Stewart, Minister of the Interior, Dr. E. Deville, Commissioner of Surveys, and Hon. Dr. Roche, chairman of the Civil Service Commission, were the speakers.

The election of officers for 1922, resulted as follows: president, G. H. Henriot, M.E.I.C., Winnipeg; vice-president, D. H. Nelles, M.E.I.C. Ottawa; secretary-treasurer, W. L. MacIlquham, Ottawa; councillors for Ottawa; J. W. Pierce, B. H. Segre, A.M.E.I.C. A. M. Perry, J. E. R. Ross, A.M.E.I.C., T. H. G. Clunn, A.M.E.I.C.; councillors for Ontario: E. P. Bowman, A.M.E.I.C., (West Montrose), F. W. Beatty, (Pembroke); councillors for Quebec and the Maritime Provinces: E. F. Gorman, (Buckingham); councillors for Manitoba, W. E. Hobbs, A.M.E.I.C., (Winnipeg), C. E. Joslyn, A.M.E.I.C., (Winnipeg); councillors for Saskatchewan: W. M. Stewart, A.M.E.I.C., (Saskatoon), W. R. Reilly, (Regina); councillors for Alberta: H. E. Pearson, (Edmonton), J. B. Alexander, (Calgary); councillors for British Columbia: J. E. Umbach, (Victoria), E. C. Coursier, (Revelstoke).

Ontario's Government Roads Programme

The Victoria Memorial Museum auditorium was filled on the evening of February 16th, when, under the auspices of the Ottawa Branch of *The Engineering Institute of Canada*, George Hogarth, O.L.S., M.E.I.C., of Toronto, chief engineer of the department of public highways of Ontario, delivered a most interesting address on "Our Public Highways". The lecture was illustrated by lantern slides as well as two moving picture films, and dwelt on the course of roadbuilding in Ontario from the revival of five years ago to the present time.

Two announcements of interest to Ottawa were made during the course of the lecture, one that the Ottawa-Prescott highway would be permanently surfaced from the city limits to Hog's Back, a distance of over two miles, and a second that the missing two miles of pavement on the Ottawa-Point Fortune road, a few miles out of Ottawa, will be built in the early part of the coming summer.

K. M. Cameron, M.E.I.C., Chairman of the Ottawa Branch of *The Institute*, introduced the lecturer, who pointed out that the development of the motor car created the necessity for good roads, and these developed with the development of motor vehicles. He outlined the various types of roads in Ontario. There was, first, the township road, of various types. Some of these had been taken over by the county as county roads. Some near cities had been taken over by suburban road commissions. On such as were still township roads the government paid 20 per cent. towards the cost. The roads were usually of earth and gravel and were frequently narrow, as they did not represent main travelled thoroughfares. Of the total township roads of a few years ago the Ontario counties had now assumed about 15 per cent. as county roads. On these latter the government paid 40 per cent. of the rebuilding and maintenance. Then there was the still higher type of county provincial roads which were constructed of a variety of materials from earth and gravel to concrete. On these the province paid 60 per cent.

Suburban roads commission had come into existence to look after the roads leading into a city, and 40 per cent. of the cost was contributed by the government, 30 by the city in question, and 30 per cent. by the county. The city and county jointly appointed the commissioners and the roads they constructed were usually of the permanent class.

At the conclusion of the lecture, two films were shown by the courtesy of the Department of Trade and Commerce. One was taken at various points on the Ottawa-Prescott highway, and the other was taken partly from motor car and partly from airplane on the Toronto-Hamilton highway, and was known as the "Silver Trail".

A. W. Campbell, M.E.I.C., Dominion commissioner of good roads, moved a vote of thanks to the lecturer for his interesting address.

Montreal Branch

J. L. Busfield, A.M.E.I.C., Secretary-Treasurer.

Chippawa Power Development

The first meeting after the Annual and Professional Meeting was held on Thursday evening, January 26th, at which H. G. Acres, M.E.I.C., gave a most interesting illustrated talk on the Queenston-Chippawa Power Development. The attendance was so great that many were unable to find even standing room in the hall. The author gave a technical description of the structure and construction proceedure in the work on the canal, the building of the power houses, and installation of the power plants. The address was followed by a series of motion pictures which were extremely interesting. The chair was occupied by J. A. Duchastel, M.E.I.C., chairman of the Branch.

Automotive and General Lubrication

On Thursday evening, February 2nd, W. C. Common, general manager of the Sun Oil Company, gave an address dealing with Automotive and General Lubrication from a technical point of view, following which there was an excellent discussion. E. J. Turley, A.M.E.I.C., presided.

Water Softening

On Thursday evening, February 9th, C. E. Hogarth, A.M.E.I.C., discussed the principles of water softening, with F. A. Combe, M.E.I.C., presiding. The speaker gave a brief outline of how all natural waters originate in rain, but in passing over the ground they gather impurities in the form of suspended matter and dissolved salts. The former is usually removed by filtration, the rapid sand filter being the most satisfactory and economical in most industrial plants — which gives a clear sparkling water free from all visible impurities.

Hardness in water, mostly lime, although dissolved and invisible, is the cause of the largest waste in manufacturing plants using natural untreated waters. This hardness is the cause of scale in the tea kettle or boiler, and the curd which forms when soap or soda is added to hard water.

The removal of this hardness or the softening of water in Canada in the past has usually been done by adding chemicals such as soda to the water. This method, although improving the water, never produced a water of zero hardness and, consequently, the best results cannot be obtained; the cost is high and requires expert supervision to get even good results.

The most satisfactory method now used for softening water is by the use of zeolite. In this method the zeolite mineral is held in a steel container, and the water filtered through it; the lime or hardness remaining with the mineral and the water passes from the bottom of the container perfectly soft. By this method a water of zero hardness is always assured.

Mr. Hogarth showed some interesting slides showing the process of the natural zeolite from the time it is mined until it is ready for commercial use, and also actual samples of the mineral in its natural state and after refining.

South American Railways

On Thursday evening, February 16th, H. K. Wicksteed, M.E.I.C., of the Canadian National Railways, reviewed the history of the South American Continent, with particular reference to the development of railways.

The first stretch of railroad in Brazil was all 5 ft. 3 ins. gauge, similar to that adopted in Argentina at the time; the conditions there warranted the use of the wide gauge tracks, whereas it was different in this section of Brazil. This was the first serious mistake made by the Brazilians in connection with the development of their railroads, but they very soon realized their error, and as a result, at the present time 60% of all railroads in Brazil were narrow gauge. This suited their conditions admirably, because of the fact that their average hauls were as yet within 300 miles, and also because of the limited capital available when the enterprise was first undertaken.

Another remarkable feature of the Brazilian railroads was that large culverts were practically non-existent. This in a country of tropical rainstorms and impermeable soil was made possible only by following the watersheds between streams wherever possible. Where a great valley cut across the country, heavy grades in conjunction with 20 percent curves solved the problem. Gravel or sand ballast was practically unknown, rock ballast only beginning to be used in the best roads, but sparingly.

Mr. Wicksteed mentioned the development of a new port and a new railway entrance to finally link up with a port on the Carribbean Sea. This would furnish a means of developing the rich mines and utilize to great advantage the vast grazing lands, fertile country and other natural resources in South America. The Southern continent was also rich in water powers which would permit of economical electrification of the country in the future.

In closing, Mr. Wicksteed spoke of the trade possibilities between the South American countries and Canada. Canada had already a foothold in Brazil, owning and operating the tramway systems of most of the large cities, the electric lighting systems, telephone plants and other industries. In view of these facts there was no reason why Canada should not trade with Brazil more extensively, each country having as exports some of the necessities of the other. Furthermore the Canadian engineer was playing an important part in the development of almost every South American country.

P. B. Motley, M.E.I.C., engineer of bridges of the Canadian Pacific Railway, presided.

Prizes to Students

Preceding the speaker of the evening, there took place a presentation of prizes to students for the best papers during the year ending June 1921. The presentation was made by Walter J. Francis, M.E.I.C., Vice-President of *The Institute* on behalf of President J. G. Sullivan. The prizes were in the form of cheques, one presented to A. Murray Robertson, S.E.I.C., for his paper on "The Organization of the Engineer Service during the War". Mr. Francis introduced the author, giving an outline of his overseas service in the Canadian Engineers, during which he was awarded the M.C., and twice wounded. Mr. Robertson is now in the engineering department of the Bell Telephone Company.

The other prize was donated to E. R. Woodward, Jr.E.I.C., for his paper on "The Coal Briquetting Plant at Bienfait, Sask." Mr. Woodward first became interested in this subject when he was overseas with the 1st Tunnelling Company, and in order to follow up Canadian practice he went to Saskatchewan at his own expense and worked for the Lignite Utilization Board in many capacities from a laborer to a laboratory assistant. As a result of his studies he wrote the paper which won him this prize.

Branch Secretaries' Meeting

At the commencement of the meeting, the Branch Secretary, J. L. Busfield, A.M.E.I.C., gave a short address on the results of the Branch Secretaries Meeting, an account of which is given elsewhere in this issue of *The Journal*.

Quebec Branch

Hector Cimon, A.M.E.I.C., Secretary-Treasurer.

Aircraft and the Possibilities of its Use by Engineers

An evening meeting was held on the 30th of January in the Green Room of the Chateau Frontenac, which was very well attended by local members and some friends. Chairman A. R. Décary, M.E.I.C., presided and introduced R. H. Nisbet, forest engineer, in charge of the aviation service of the firm of Price Brothers & Company, Limited.

Mr. Nisbet gave an interesting talk on aerial photography in connection with mapping. He said that there were many objections to so-called aerial surveys, and that accurate maps of large tracts of country could only be obtained from aerial photographs with the aid of a proper system of ground controls. The engineer on the ground is still and will remain the chief; he must direct the work of the airman; the pilot's duty in the air is complete when he flies his machine correctly in the course required, maintaining an even keel and constant height.

He elucidated the technicalities of the aerial camera and described the French, German and American cameras used for air photography. Photographs are taken at a height of 5,000 feet, 10,000 or even 15,000 feet, depending

on the type of camera used and some 300 exposures can be automatically taken in one hour. The speed of the aeroplane can be maintained at 100 miles an hour, so that the photographs taken in that time cover an area of several hundred square miles on the ground. Over 1,000 photographs were taken in a day by Mr. Nisbet's assistants, last summer.

There are certain errors in an aerial photograph which render extremely accurate survey difficult and, while they do not render accurate work impossible, they materially increase the cost owing to the work entailed in rectifying the photographs before the information they contain can be transferred to map form.

There are various claims made for and against the aeroplane for purposes of survey; the speaker feels certain, however, that in the not too distant future, it will be common practice in this country for an aeroplane, working as an adjunct of the engineer, to carry out the most accurate work, and that, with the aid of the aeroplane, the less known areas of our vast country will be surveyed at a pace hitherto impossible.

As to the cost of flying, including the use of an efficient machine, with pilot, mechanic, fuel, oil, depreciation and interest on the capital involved, accepting the life of a machine as 3 years, it may vary from sixty to eighty dollars an hour. If the photographic personnel and equipment is added to this, the cost may run up to $140 per hour. The great disadvantage of flying in this country, as far as costs are concerned, is the necessity for paying wages for a year during which there is only six months flying, and like everything else, the more the aeroplane is used, the less, proportionately, will be the cost per flying hour.

Mr. Nisbet concluded in saying that aviation is good enough to stand on its merits, and it will go ahead and develop in spite of the fact that it is not cheap.

A number of lantern slides were next placed on the screen, showing areas which had been photographed from the air, and useful explanations and comments were made by the speaker.

This was followed by a very interesting exhibit of moving pictures, showing the work of logging during the Winter months in the woods, the floating of the logs down the rivers to the mills, and the manufacture of newsprint by the firm of Price Brothers and Company, Limited, to whom the members of this Branch are much indebted for the courtesy with which they were given an opportunity to see that valuable film.

At the close of this exhibit, E. A. Evans, M.E.I.C., moved a vote of thanks to the lecturer, which was cheerfully carried.

The Scope of Engineer in Forest Industries

This was the subject of a most interesting address given by S. L. deCarteret, Esq., A.M.E.I.C., manager of the Lands Dept., for the firm The Brown Corporation, before the members of this Branch, at the monthly luncheon-meeting, which took place at the Chateau Frontenac, on the 13th of February.

Chairman A. R. Décary, M.E.I.C., presided the meeting, and introduced the speaker who, on rising, thanked his fellow engineers for their applause, and jokingly remarked that he was sure of it now, even if there should be none when he finished. He said that, in choosing his subject, he had in mind the pulp and paper industry but that his remarks will apply equally to the lumber industry.

More than 100 pulp and paper mills are in operation in Canada, and these have a total capacity of about 2,300,000 tons annually. These mills represent a capital investment of more than 350 million dollars, and they employ in excess of 32,000 persons, in addition to many more thousands engaged in the woods' operations.

The Province of Quebec has over 45 pulp and paper mills, representing a capital investment of more than 175 million dollars, and whose combined capacity is in the neighbourhood of 4,000 tons per day, which is about 50% of Canada's entire pulp and paper production.

This, then, is the field. What is the engineer's relation to it?

Mr. deCarteret stated that the pulp and paper industry employed at least thirteen branches of the engineering profession. Thus, the engineer occupies a very important place in the manufacture of pulp and paper. His widest field of usefulness, however, is probably in improving methods of converting and transporting raw material from the forest to the mills now in existence.

It was formerly considered good practice to tell the bush foreman to cut so many logs in a certain region, and if he got them at a reasonable price, the logging was supposed to be a success in spite of the fact that only the best timber adjacent to the streams was being cut and that the forest was being wasted. To-day, the engineer is employed to survey and map the timberlands in advance of the logging operations; topographical plans show definitely how best to log and bring out the timber.

Engineers now locate and build storehouses or depot-camps where they will serve the greatest territory economically for the longest time. They also make careful reconnaissances and surveys for locating roads so that the best possible grades can be obtained and minimum maintenance result.

Until a few years ago dams for driving purposes were located and built in a haphazard manner and were often washed out or did not give the results which were expected on account of the lack of technical and meteorological knowledge displayed in the construction of the dam or the choice of the site. The use of engineering principles now does away with these troubles. Other river improvements such as side piers, holding booms, jam piers, etc., also claim the attention of the engineer.

Engineers, on many instances, were also called to supervise log drives and this important work was then found to have been accomplished with great dispatch and economy.

Probably the most useful servant of wood using industries is water, as it is the cheapest and most used means of transporting the raw material. However, the water courses designed by nature do not always suit our requirements. Hence, the use of flumes which often make it possible to obtain timber otherwise inaccessible. At times a flume may be used to deliver the wood output of several streams to one central point, thereby eliminating separate wood preparing plants. Again flumes may

be used to advantage in diverting wood from one watershed to another. Water sluices are also used to load wood into boats or cars.

All those works and many others, said Mr. deCarteret, are of interest to the engineer and call for his resourcefulness and ingenuity.

It will be the engineers' task to bring vast areas of forest lands, at present inaccessible into close communication with business centres; railways will have to be built; towns laid out; harbour works constructed; channels dredged and vessels more suitable for carrying certain forest products designed and fabricated.

In places where, to-day, the forest stands untouched, to-morrow the engineer must exercise his skill in planning for the economic utilization of nature's wealth.

Concluding, the speaker asked: is this not scope enough for the engineer? Does it not give him ample opportunity to make a permanent record of his labours and should he not derive great satisfaction in so doing?

Paul Joncas, A.M.E.I.C., professor at the Laval Forestry School, then said a few words expressing the feelings of all the members present, and moved a vote of thanks to Mr. deCarteret which was heartily carried.

Arthur Fournier, A.M.E.I.C., also moved a vote of thanks to the Chairman for the able manner in which he had presided at the meeting. Carried.

St. John Branch

Harry F. Bennett, A.M.E.I.C., Secretary-Treasurer.

Hydro-Electric Situation

The regular monthly meeting of the Branch was held on Thursday, Jan. 19th, with F. P. Vaughan, M.E.I.C., in the chair. The discussion on the Hydro Electric situation and its relation to the City of St. John was continued by Herbert Phillips, M.E.I.C., who has taken an active part in the public discussions, as an advocate of Municipal Distribution.

The available water in the Musquash River, the question of a steam standby, the demand for power, and the relative costs in the several provinces were discussed by Mr. Phillips and Messrs C. C. Kirby, M.E.I.C., C. O. Foss, M.E.I.C., S. R. Weston, A.M.E.I.C., and several others.

This question is receiving extensive publicity in St. John and the Branch has devoted two meetings to the discussion of the various sides of the question.

Annual Meeting of the Association of Professional Engineers of the Province of New Brunswick.

The second annual meeting of the Professional Engineers of New Brunswick was held in St. John on Jan. 27th. with a large attendance of members from all parts of the province. The Annual report of the Council showed a total registration of 179, and the financial statement, a surplus of $2,889,67.

The election of officers for 1922 resulted as follows:

President...S. B. Wass, A.M.E.I.C., Moncton, N.B.
Vice-Pres...C. C. Kirby, M.E.I.C., St. John, N.B.
Councillors, St. John District, F. P. Vaughan, M.E.I.C.
H. F. Bennett, A.M.E.I.C.
" Moncton District J. D. McBeath, M.E.I.C.
K. S. Pickard, A.M.E.I.C.
" Fredericton " B. M. Hill, M.E.I.C.
" Chatham District R. J. Sandover Sly, A.M.E.I.C.

C. C. Kirby, M.E.I.C., the retiring President addressed the meeting on the necessity of high standards and greater service to the public. The benefits of organization and the spirit of Brotherhood were emphasized and the members were given a very vivid picture of the ideal to which they should strive to attain.

At the conclusion of the business meeting the members adjourned to the LaTour Hotel where a special dinner was served under the auspices of the St. John Branch of *The Engineering Institute of Canada.* Among the guests were the Hon. W. E. Foster, Premier of New Brunswick, and Commissioners J. B. Jones, T. H. Bullock, and J. H. Frink of the City of St. John.

After a very fine dinner, S. R. Weston, A.M.E.I.C., asst. chief engineer of the N.B. Power Commission addressed the gathering on the development of Hydro Electric Power in this province. He pointed out that we have not a Niagara available in this province, but we have a large number of small powers which are capable of economic development. The question of the advantage of such power is not an issue, but it is necessary for the province to have a cheaper and more abundant supply to adequately develop our industries. He hoped that the province would benefit by the developments carried out by the Power Commission.

C. C. Kirby, M.E.I.C., said that every organization should thoroughly discuss this Hydro question. It was a duty that the engineers owed to the public, to throw additional light on this matter by discussion.

Hon. W. E. Foster, in proposing the toast to the engineering profession, said that he felt honoured to speak before a profession that had done so much in building up Canada. The engineering profession was an honoured one, and he did not wonder that youths were attracted to it. The great Quebec, and other bridges, the railways and water power developments, were monuments to the engineers. After touching on the finances of the province and the need for economies in all branches, Mr. Foster concluded by stating that public works of a national character were required in St. John. The people demanded that Canadian traffic should pass through Canadian ports. They were not sufficient facilities here for that traffic and works undertaken should be completed without delay.

S. B. Wass, A.M.E.I.C., the newly elected President of the Association, expressed the gratitude of the visiting members for the able manner in which they had been entertained by the St. John Branch.

Retiring President's Address.

C.C. Kirby, M.E.I.C.

In retiring from the Presidency of this Association I feel it incumbent upon me to make a few remarks, other than those in the way of the pleasant duty of thanking you for your suffrages and support in

the past and assurance of my continuing assistance in the future to our new president and the Association as a whole, as far as I am able to do so.

The present moment appears to me to be a fitting one in which to review with you what has already been accomplished and what, as I conceive it, we are endeavouring to achieve in the future. Our Association will in a short while enter upon the third year of its corporate existence. In looking back we find that we have attained the goal, in form at any rate, the engineers have been seeking for the past twenty years and more. The engineering profession in this Province is a closed corporation sanctioned by legal enactment. Is this in itself a desirable and profitable achievement looked at from the point of view of individual members and the community in general? I frankly and freely state that I believe it is not, but what that it is only a necessary and proper means to an end. What then is this end which we are seeking. That is a very difficult thing to express in a few words but perhaps the terms character and service will give us some light upon a somewhat misty objective.

As was most eloquently brought out in a recent address to the E.I.C. by a prominent member, there is a need today for the development of the tribal spirit or soul of the engineering profession. It is no uncommon thing among engineers to experience a feeling of reluctance or almost of being ashamed to have to reply to a query as to the nature of one's occupation, "I am an engineer" for fear that one's hearers might think to themselves "Oh, only an engineer" with a feeling of disdain or pity, whereas there should be as much right to be proud of being able to say "I am an engineer" as of being able to say "I am a Canadian" or "I am a British Citizen" in any part of the world. That is one of the basic principles that we want to have underlying the character of all the members of our profession, pride and occupationr and with it will go pride of work accomplished, however simple or unromantic it may happen to be, even if it be only the making of a tracing or a blue print.

Then again there is service. Service to our employee. Yes that is of course the bounden duty of all true men. To do what is expected of us; but there is for engineers a further opportunity than that. Not only should the very name engineer imply duty always well and truly done but more than that, it should mean willingness to do more than duty. Willingness to be of service to others in the community, to the state, to our neighbors, to our brother engineers, and without expectation of additional reward. Not for notoriety or for influence or power but for love of the profession and the work itself and the exercise of knowledge and experience for the good of others and the feeling that we have done the best we could and made the most of our opportunities of service.

Our opportunities of service are different from those of all other occupations and professions. Our point of contact with the public is very different from that of other professions. We don't as a rule, come into direct contact with the public as do for instance the doctor and the dentist their contact is personal contact of a very pronounced type with individuals chiefly. The lawyer comes in contact with individuals also but from a psychological rather than a physical aspect and in his public appearances in his profession he is protected and glorified by his robes of office and his privileged position in the public courts. However, these men have to reply upon their hold upon the public for their means of livelihood and their rewards are very largely in proportion to their individual merit.

With us the case is different, the majority of us receive stated salaries and our contact with the public is not personal. Our opportunities for creating public opinion favourable to us lie, therefore in organization work rather than personal work of this character. We must organize ourselves for service to the public. This brings us to the question of what is the value to the individual member in joining an organization in which he may not be able to take an active part. When we consider the matter we find that engineers may be grouped in three broad classes. Those who work in large centres of population, those in medium sized centres and those in very small centres or among no population at all. With the engineering profession there is no general proportion between the number of engineers present and the size of the community. It cannot be figured that it takes so many persons to support an engineer as can roughly be done with lawyers, doctors and dentists. The number of engineers in a community depends more upon the types of industry in a community or the location of Government or Corporation Headquarters than anything else, although there is a rough general proportion that a large town will have more engineers in it than a small town. Though some small towns may have two or three times the number of engineers of some larger town.

In the cases of large towns with large numbers of engineers the situation as it exists today is not as good as in the smaller centres. The reason is that of greater difficulty of organization and the less opportunity there is for the general average of members to take prominent parts, with the result that large numbers have no part at all and are indifferent to the calls of organization. In the smaller towns organization is easier and personal intercourse between all of the members is possible, and it is here that community service finds its best expression at present.

In the third case where only a very few engineers can be found in any one locality the case is again different. The feeling that it is not worth while to belong to any organization has in the past been very prevalent. The successful organization of this Association is evidence that this feeling is passing away or has at least been suppressed for a while, with a view to giving organization a chance to show what it can do. Well what can it do to brighten the lives, build the character, improve the prospects of isolated members and those of the lower ranks. These are the questions which are of importance to the large majority of the membership. The public also has a right to know what will be the result of giving special privileges to any group of citizens by passing legislation for their use.

Let us take these questions separately and see how they can be answered.

Moncton Branch

M. J. Murphy, A.M.E.I.C., Secretary-Treasurer.

The regular monthly meeting of the Moncton Branch of *The Engineering Institute of Canada* was held Thursday evening, January 5th, in the Happen Inn tea rooms, where a chicken dinner was served at 6.30 P.M. A large number of members and several guests were present. J. D. McBeath, M.E.I.C. asst. city engineer, presided, and after dinner announced that Vincent Doucett would render a violin solo, accompanied by Major W. A. McKee. Mr. Doucett delighted the audience and was heartily encored.

The Chairman spoke briefly, wishing each member and guest a happy and prosperous New Year. He stated that the *E.I.C.* had done such gratifying work in the last year, and he expressed his belief that it is only through an organization such as *The Engineering Institute* that the engineering profession will attain the status it deserves.

Mr. McBeath then introduced City Engineer John Edington, M.E.I.C., declaring that as a hydraulic engineer he had no peers in Eastern Canada. Mr. Edington then read a very interesting paper on the history of the Moncton City Water Supply.

The water supply of any community is one of the most important factors in connection with its existence; therefore great care must be observed in selecting the best available source, whether it be a lake, river, impounding reservoir or artesian wells. Cities and towns that are situated in proximity to lakes or large rivers can get their supply direct, while others have to construct impounding reservoirs to store sufficient water during the rainy seasons to tide them over the dry, such as is the case in Moncton. We are fortunate here, however, in having brooks within reasonable distance of the city.

Where storage reservoirs are to be constructed some of the essential features to be first determined are the dry season flow of brooks, annual precipitation and the area of watershed. It then becomes necessary to look for the best natural site for the dam, which, for a gravity supply, should be at a point where sufficient head can be obtained to deliver the water with ample pressure throughout the area of consumption. The size of the dam is determined by the amount of water that is required to be

impounded in order to guarantee the supply during dry seasons and the reservoir should at least contain enough for 120 days.

The leading main from the reservoir should be of ample size, laid in as direct a line as possible, the grade of which to be such that at no point should the pipes be above the hydraulic grade line. Air valves are placed at all summits and flush valves at each depression throughout the line, as well as sufficient gate valves to facilitate repairs.

The distribution system should be laid in gridiron fashion, and no pipe should be less than 6 inches in diameter where fire hydrants are located. Gate valves should be placed on branches at street intersections.

Such are a few of the principle features of a simple gravity supply.

A brief history and description of the Moncton water supply may doubtless be of some interest. This water supply was first introduced by a private concern, the Moncton Gas, Light and Water Co. This company was incorporated by Provincial Act in 1877, and the following year an act was passed enabling the town to contract with the company for water and gas, and an agreement was entered into between the town and the company in November 1887, for a term of ten years.

The original works were designed by Gilbert Murdock, of St. John, and E. H. Keating, of Halifax, both now deceased. The former acted as consulting engineer until 1883, when the writer was appointed engineer of the company.

It might be in order to deviate a little from the subject and refer briefly to the other utilities controlled by this company.

In 1885 an electric lighting system was installed and the machinery placed in the Sugar Refinery which was run there for about a year until a suitable building was erected at the present site. The initial plant consisted of a 50 H.P. side crank engine and a 40 light direct current, Thompson Houston dynamo, supplying 35 arc lamps of 2,000 candle power for street lighting. The gas works were completed shortly after the water works and had a capacity of 5,000,000 cubic feet per annum. The principal consumers were the Intercolonial Railway, Sugar Refinery, Cotton Factory, Record Foundry, stores on Main Street, and also the street lighting.

About the year 1893 citizens' meetings were held with a view of acquiring the company's plants, and in 1894 an act was passed enabling the city to expropriate the entire works of the company. Arbitration proceedings opened on August 28th, and were concluded on September 15th, the arbitrators being as follows: Walter Shanley, C.E., of Montreal, for the city, chairman; Robert Surtees, C.E., of Ottawa, for the city, and F. W. Holt, C.E., of St. Stephen, N.B., appointed by the Government of New Brunswick. The award of the arbitrators was as follows:

Water works system	$265,050.00
Electric lighting and gas works	78,658.00
Total	$343,708.00

The city also assumed $60,000 water works 6% bonds that had been issued by the Company. In January, 1895, the city disposed of debentures to the amount of $350,000, in order to pay the award. The city took possession of the works in 1895.

The Irishtown reservoir was constructed on Black Mill Brook, from which duplicate mains convey the water to the city, a distance of about 3¼ miles. One of these mains, the original, was laid in 1878, and the other in 1904. The area within the water shed is 5 square miles. When first constructed the wasteway was at an elevation of 136 feet above city datum, and the reservoir had a capacity of 35,000,000 gallons. The height of the dam has been increased twice since then, first to 144 feet, giving a capacity of 138,000,000 gallons, and later to 147 feet at wasteway, its present level, giving a storage capacity of 250,000,000 gallons. The difference in elevation between Main street at city building and wasteway at dam is 119 feet, and at highest point of city, 40 feet. The topography of the surrounding country is such that this reservoir cannot be raised much above its present level.

About two miles above this reservoir another dam, 14 feet in height, was constructed, 1889-90, giving a storage capacity of 10,000,000 gallons.

As the consumption increased, a pumping station was constructed, in 1889, and a 10 by 16 by 12 in. duplex steam pump installed. In 1909, an addition was made to the station, and two 1-stage turbo electric pumps, having a nominal capacity each of 2,000 gallons per minute, were installed. Both pumps were adjusted so that they could be operated in series, in multiple, or singly. The steam pump was then abandoned.

As the city increased in population it soon became evident that an additional supply would be required; therefore surveys were commenced with that end in view, and the McNutt Brook was finally decided upon as the source of new supply. Contracts were entered into in August 1911, and the entire system was completed in the fall of 1914, the water being turned on in the city on December 17th, 1914. The reservoir is located about 3½ miles from the city on the McNutt Brook, and has a capacity of 300,000,000. The dam is so constructed with berms on both slopes that it can be raised at any time. The mains through dam are in duplicate 20 in. in diameter, and the gatehouse has double screen chamber. Water can be drawn off at intakes located at three different levels.

The leading main from reservoir to pumping station is 20 inches in diameter.

The pumping station is equipped with the following: one centrifugal pump, capable of delivering 3470 Imperial gallons per minute when operating at 750 R.P.M. The pump is driven by a rope drive, which consists of 26 one inch cotton ropes. The motive power is a Premier gas engine, having four cylinders side by side, and capable of delivering 460 B.H.P. when running at 200 R.P.M. A special speed indicator is provided in the engine, so that the speed may be changed instantly from 160 to 200 R.P.M. The water pressure at the pump delivery may therefore be changed instantly from domestic to fire pressure as required, these pressure being 45 lbs. to 75 lbs.

respectively. The fuel is natural gas. An emergency source of power is provided in the shape of a suction gas producer for operating on pea anthracite coal, also auxiliary apparatus for blowing in the producer and for supplying compressed air for starting the gas engine. There are also the two turbo electric pumps which were transferred from the old pumping station, thus giving two separate and distinct units of supply. The mains from Irishtown reservoir are now connected to suction pipes in new pumping station and are common to both pumps. This arrangement give a very elastic system of supply, for if one pump gives out, the other can be started up and should both give out, there would still be the gravity supply which would give from 25 to 30 lbs. on Main street. The discharge mains from pumping station are two in number, 18 inches and 16 inches in diameter, laid to centre of distribution on St. George street and both along separate routes.

The population of Moncton, when the water works were first constructed was about 5,000. Since then the system has increased from a storage reservoir of 35,000,000 gallons, with about 7 miles of leading and distribution mains, to a system of 550,000,000 gallons, with 38¼ miles of leading and distribution mains, the population now being over 20,000. The daily consumptions averages 3,000,000 gallons, the largest consumer being the C. N. Railway.

On the completion of Mr. Edington's paper, the Chairman introduced Edward Holgate, chief engineer of the MacKinnon Bridge Co., of Sherbrooke, P.Q. Mr. Holgate, who is in charge of the designing and erection of the new skating rink at Sunny Brae, spoke briefly on the unique features in connection with this structure.

The ground plan is a circle 200 ft. in diameter; the roof is a truncated cone of 45% pitch, composed of 16 rafters resting on 16 columns.

The tension at the line of the eaves, he explained, is taken up by a heavy steel plate corresponding to the rim of a wheel, and an equal and opposite compression force is resisted by seven circular lines of purlins designed to take compression.

The rafters themselves are compression members only. Mr. Holgate gave other interesting details, introduced to provide for concentrated uneven loading. He also outlined his very interesting method of erection.

After considerable discussion by the members, the Chairman in tendering a vote of thanks and appreciation to Mr. Holgate, for his very interesting address, given on such short notice, expressed the wish that we could have the pleasure of listening to another address from Mr. Holgate in the very near future, when he would have a longer period to prepare it.

Cape Breton Branch

[illegible], A.M.E.I.C., Secretary-Treasurer.

A regular monthly meeting of the Branch was held at the Bank of Commerce rooms, on Thursday, February 9th.

In the absence of the Chairman of the Branch, the meeting was presided over by Horace Longley, M.E.I.C., who called upon Geo. D. Macdougall, M.E.I.C., chief engineer of the British Empire Steel Corporation, to read his paper on "Shipbuilding".

Mr. Macdougall, who had made a special trip from New Glasgow, said that, owing to short notice and hasty preparation, his paper was in a somewhat incomplete condition. He gave a brief historical sketch of the development of shipbuilding from the earliest recorded vessel, — the Ark, whose dimensions, he stated, were quite in accordance with present day practice, to the modern ocean going cargo boat. His paper dealt more particularly with the latter type of vessel, which represented by far the most important and most numerous class afloat.

Recalling the prominent part which Nova Scotia, as a Maritime Province, had always taken in Canadian shipbuilding, Mr. Macdougall told of the origin of the New Glasgow and Halifax Yards, and the difficulties which had to be overcome, difficulties which had taxed the ingenuity of those responsible, and demonstrated the capabilities of the ordinary machinist and mechanic, to whom great credit was due for their share in the development of a new industry. Most of the vessels built at the New Glasgow yard during the war had been framed, engined, and, with a few small exceptions, such as wireless, fitted completely with local labour, with local material.

Enlarging on this side of the question, Mr. Macdougall, without going into the strictly technical side, described in more detail how these two yards had overcome the problems with which they had been confronted, those in charge drawing on the resources of the allied companies. In concluding he expressed the opinion that the people of Nova Scotia would do well to devote more thought to the matter of shipbuilding, and to sustaining the province in the premier position which it has always taken, it being the oldest and most essentially maritime province in the Dominion. He further undertook to deal with the more technical side of the question in an addition to his paper, to be presented at a later date.

Following the reading of the paper, numerous questions were asked. In reply to Mr. Longley, Mr. Macdougall said that there was one boat afloat which was electric welded throughout, but it had not been long enough in service to have been accepted by Lloyd's. Oxy-acetylene was permitted only for cutting, — all welding must be electric. In reply to K. H. Marsh, M.E.I.C., as to the percentage of plates requiring to be laid off in the mould loft, and as to the value of geared turbine drives, Mr. Macdougall said that only plates which had to be formed required to be laid off, most of the deck and seventy-five percent of the hull of the regular cargo boat was not formed. The only example of geared turbine propulsion turned out from their yards was the War Wasp, New Glasgow, 1917, which was still in service, although torpedoed twice, and she had given satisfaction.

On the motion of K. H. Marsh, M.E.I.C., seconded by D. F. MacIsaac, A.M.E.I.C., Mr. Macdougall was accorded a hearty vote of thanks for his paper.

The Chairman then called upon the Secretary to report on the Annual Meeting and the Branch Secretarial Conference. The Secretary outlined the origin of the

conference, and, reading in part from the minutes, gave a detailed account of the work dealt with and the conclusions arrived at. At the close of his report, the following motion by J. H. Fraser, A.M.E.I.C., seconded by I. W. Buckley, A.M.E.I.C., was carried unanimously:

"The Cape Breton Branch, situated in the most Easterly extremity of the Dominion, does endorse and appreciate the work of the Branch Secretarial Conference, and the opportunity afforded thereby for co-operation and advancement, and suggests and strongly recommends to Council that a similar conference of all Branch Secretaries throughout the Dominion, be held annually at the time of the annual general meeting of *The Institute*, and that Council should set aside a sufficient appropriation to cover the cost of such meeting."

Halifax Branch

O. S. Cox, A.M.E.I.C., Secretary-Treasurer.

The regular monthly meeting of the Branch was held in the Nova Scotia Technical College at 8 P.M., Jan. 17th. C. St. J. Wilson, A.M.E.I.C., read a paper on some construction problems encountered in local buildings taking for his subject three buildings recently reported on and strengthened under the supervision of the firm of Pickings and Roland of which firm Mr. Wilson is a member.

Building No. 1 is 45′ x 60′ in plan and four stories high, the two upper stories having been added at a later date. This building is at present used for warehouse purposes except the ground floor and part of the second floor which are used for show rooms and offices respectively. The live load would average from 75 lbs. per square foot to 100 lbs. per square foot. The third and fourth floor joists 3 x 12 spruce, 16″ cts. on spans of 16′-0″, 18′-0″, 19′-0″ and 25′-0″ are good for from 69 lbs. per square foot to 126 lbs. per square foot total safe load at 900 lbs. per square inch allowable bending stress. The original girders of the third floor consisted of four 2½ x 12 planks. When the additional stories were added the joists of the third floor were dapped down seven inches and an additional girder eight inches deep inserted above the old girders, these new girders being continuous over the centre support. By equating the deflections of the different girders, Mr. Wilson determined the proportion of the load carried by each beam and found that for an assumed live load of 40 lbs. per square foot (less than that called for in the design of an ordinary residence by the Halifax building code) the spruce timbers were stressed as high as 2950 lbs. per square inch in bending and to 311 lbs. per square inch in horizontal shear. For the same loading the main girder at the second floor carrying the second floor columns was stressed to 3440 lbs. per square inch in bending and 447 lbs. per square inch in horizontal shear. This girder was built up of four 3 x 12 spruce planks continuous over three spans of 20′-0″, 6′-9″ and 16′-0″.

Building No. 2 used entirely for warehouse purposes had reinforced concrete walls and is L shaped in plan. The second floor is carried by 20″ I beams at 80 lbs. about 14′-0″ centres and 33′-0″ span. The third and fourth floors and roof are carried by timber girders and columns resting about the third points of the 20 I beams. The loading in this building is extremely heavy and the building should be designed for from 250 lbs. to 300 lbs. per square foot. Assuming a roof load of 50 lbs. per square foot and a total floor load on each floor of 60 lbs. per square foot, these I beams would be stressed to 30,200 lbs. per square inch. One spruce beam in this building assuming the same loading is above and neglecting a portion of the elevator load which the beam carried, was stressed to 5830 lbs. per square inch in bending and 238 lbs. per square inch in horizontal shear. This beam had deflected over three inches.

Building No. 3 was also a warehouse building carrying the same loads as building No. 2. The joists in this building were limited by horizontal shear and were good for a safe load of 224 lbs. per square foot. The girders of 8 x 12 hard pine were also limited by horizontal shear and were safe for 78 lbs. per square foot or only about one third of the capacity of the joists. In one portion of this building, in order to provide a driveway on the ground floor, one column was removed and a trussed beam inserted to take its place. This beam consisted of an 8 x 12 spruce beam, and two-1¼ inch diameter rods with turn buckles. Assuming a 50 lbs. per square foot roof load and floor loads of 60 lbs. per square foot total load, these rods were stressed to 48,500 lbs. per square inch at the root of the threads.

Mr. Wilson pointed out several other very highly stressed members and condemned the present method of building construction, stringly advocating the insistance on technical supervision by the City authorities and the revision of the present Engineering Act in Nova Scotia which limits the cost of engineering work which must be designed by a registered engineer to work, costing over $25,000.00. He pointed out that a local contractor had prepared sketches for the strengthening of building number one, taking care of only a small portion of the defects and had offered to do the work for twice the amount expended under the final plans. The total cost of strengthening buildings numbers 2 and 3 was under four thousand dollars, and it was not necessary, under the Nova Scotia Act, to have the plans prepared by a registered engineer.

Considerable interesting discussion followed the reading of Mr. Wilson's paper, after which three moving picture films from the Exhibits and Publicity Bureau at Ottawa were shown, depicting various Canadian industries and natural resources.

Town Planning Notes and Comments

Horace L. Seymour, A.M.E.I.C.

NOTE: — *In order to make this column of wide interest to members of The Institute, personals and items of town planning interest will be appreciated. Address: Horace L. Seymour, A.M.E.I.C., 40 Jarvis Street, Toronto.*

Review of E.I.C. Branch Activities in Town Planning for 1921.

In the February issue, 1922 of *The Journal*, of the E.I.C., there will be found reports of the Branches. Interest in Town Planning is evidenced by a study of these reports.

Vancouver Branch

On February 9th., the Vancouver Branch held a luncheon; the subject of the address was "Town Panning" and was delivered by Thos. Adams, F.S.I. It might be mentioned that under recent Provincial legislation, Point Grey, adjoining the City of Vancouver, is it is understood, intending to prepare zoning maps and ordinances. Various use zones will be prescribed and building lines established.

Winnipeg Branch

On Nov. 16th., the Winnipeg Branch were addressed by Capt. W. E. Hobbs, A.M.E.I.C., on the subject of "Town Planning". The Branch report also states that Capt. Hobbs was appointed Commissioner of Town Planning for the Province. The administration of the 1916 Town Planning Act (Manitoba) is in good hands. It is understood that many applications have already been received from owners of land and municipalities, who have now under the provisions of the Act, to submit plans of subdivisions, to the town planning comptroller. Now that an official has been appointed to administer Town Planning legislation it is to be hoped that the advance in town planning in Manitoba will be as marked as in the Province of Saskatchewan, which has had a director of town planning for some time. The present director is W. A. Begg, A.M.E.I.C., Regina, Sask.

Sault St. Marie Branch

An extract from the report of the Sault Ste. Marie Branch, F. Theo. Gnaedinger, A.M.E.I.C., Secretary, reads as follows:

> "A Committee on Town Planning has been formed for the purpose of studying Town Planning principles and legislation particularly with reference to their application to the City of Sault Ste. Marie. It is our intention to stimulate public interest in the Sault in a City Planning movement. Already we have secured the promise of co-operation and support from an umber of local public bodies."

Border Cities Branch

On May 13th., J. Clark Keith, A.M.E.I.C., addressed the Border Cities Branch on "Park Scheme for the Border Cities". As engineer to the Essex Border Utilities Commission, Mr. Keith has taken great interest in Town Planning matters. Maps are being prepared of areas under his jurisdiction and these will form the basis for town planning development. Mr. Keith evidently recognizes the fact that a municipal engineer must keep in touch with Town Planning matters.

Hamilton Branch

A portion of the Hamilton Branch Report reads as follows:

> "March 23rd. "Town Planning" — J. W. Tyrrell, M.E.I.C., delegate to the Toronto Convention, gave his report, J. J. Mackay, O.L.S., M.E.I.C., a member of the Town Planning Commission and the Wentworth Road Commission, spoke on Road and Boulevards, and what they mean to Hamilton. This was published in *The Journal* for August, p-470."

The Toronto Convention referred to, was that of the Ontario Town Planning and Housing Conference. This Conference recently requested the Ontario Government to codify legislation in regard to Town Planning at present scattered through various Acts.

Interest in Town Planning in Hamilton has been furthered by the presence of such members of *The Institute* as J. W. Tyrrell and J. J. Mackay. Noulan Cauchon, A.M.E.I.C., consulting town planning engineer of Ottawa, has laid out for Hamilton a scheme of mountain roadways, part of which was already been constructed. The City of Hamilton is also interested in the railway situation and in harbour improvement, for both of which studies and reports have been made.

Halifax Branch

On December 9th., Mr. H. W. Johnson, assistant city engineer, presented a paper on Town Planning. Mr. Johnson was able to refer to the work of Town Planning in the City of Halifax, made necessary by the disastrous explosion in 1917. Mr. Johnson has always taken a keen interest in Town Planning matters.

The foregoing are some of the items gleaned from the Branch reports. Undoubtedly, some other Branches are also interested in Town Planning, although nothing appears in the Annual Report. For example the Toronto Branch which last year appointed a Committee on Zoning, this year appointed a representative to meet with a Committee from the Downtown Association of Toronto in furtherance of civic improvement.

High Buildings for London, England

Up to the present the Town Planner on this continent has been able to point to Europe for desirable examples in the control of the height of buildings. Sky scrapers have been shown to be economically unsound — that in cities where sky scrapers are built, the return on the investment may be lower than two percent; sky scrapers are unhealthy, cutting off light and air; sky scrapers cause undesirable congestion in street traffic. These arguments, the town planner urged, and pointed with considerable pleasure to, for example, the London Building Act, which limites the height of buildings to 80 feet above the street level. There is an agitation now that this limit should be changed to 120 feet and further, that where buildings face Parks or open spaces, buildings even to 150 feet high should be permitted.

The London County Council Committee has reported against the change but the agitation still continues. For ordinary conditions in our average Canadian cities, the writer believes that a safe rule to adopt is that which limits the height of the building to the width of the street.

French Course on City Planning.

Interest in Town Planning education is growing. Regular courses in certain phases of Town Planning are being given in some Universities in the United States and England. A two year course of study has been prepared for the School of Advanced Municipal Research, Paris, and was organized by *The Institute* of Urban History, Geography and Economics of the City of Paris. As stated, the course has to do with the planning, beautification, and extension of cities, and their administration economic, and social organization. The course is intended for students with a purely scientific interest; for architects and engineers offered a career by the provisions of the French Compulsory City Planning Law, and the public in General. The four principal courses are outlined in "Housing Betterment," for January, 1922:

1. Evolution of Cities — "The City considered as a living organism evolving in time and in space".
2. Social Organization of Cities — With Conferences on "Municipal Ownership in France and Abroad" and the "Hygiene of Housing".
3. Administrative Organization of Cities — With Conferences on "Urban Legislation of Tomorrow."
4. Urban Art. — With Conferences on the "Art of the Municipal Engineer."

Preliminary Notice

of Applications for Admission and for Transfer

18th February 1922

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate member a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in March, 1922.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option, Railway, Municipal, Hydraulic, Mechanical, Mining or Electrical Engineering

This examination may be waived at the discretion of the Council if the candidat. has held a position of professional responsibility for five years or more years

Every candidate for election as JUNIOR shall be at least twenty-one years oe age, and must have been engaged in some branch of engineering for at least four yearsf This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects. Geography, History (that of Canada in particular), Arithmetic, Geometry Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations

Every candidate for election as ASSOCIATE shall be one who by his pursuits cientific acquirements, or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ALDER—WILLIAM ROBERT, of Cornwall, Ont. Born at Prescott, Ont., Aug 14th, 1886; Educ., B.Sc., Queen's Univ. 1907; 1907 (2 mos), dftsman., Delora Mining & Reduction Co., Deloro, Ont.; 1907-08, chemist in charge of ore analysis, Bessemer Iron Mine for Munecal Range Iron Mining Co.; 1908 (3 mos), on magnetometric surveys of iron properties, Hastings Co., for Canada Iron Corpn.; 1908-09, chief chemist, Manufacturer's Corundum Co. at Craigmont mill; 1911-13, asst. engr. during reconstrn. of Kingston & Pembroke Rly; 1913-14, mtce., of way engr'g. staff, dist. No. 1, Ont. Divn., C.P.R.; Aug. 1919 to date, on eng'g., staff, Dept. Public Highways of Ontario, as asst. res. engr., at Cornwall, in charge of survey parties and directing road and culvert constrn.

References: F. Stidwell, J. G. Cameron, G. Hogarth, H. T. Routly, J. B. Wilkinson.

ALDOUS—HERBERT, of 606 Manning Avenue, Toronto, Ont. Born at Watford, Herts., England, Sept. 15th, 1893; Educ., London College of Munic. and Sanitary Engr'g., 1915; 1919-21, large public works contract, Norwich, England, including brick and reinforced concrete bldgs., sewers, drains, water mains, new road, water softenin;g 1921, inspr., Ont. Dept. Public Highways. Not employed at present.

References: W. A. McLean, R. O. Wynne-Roberts, W. Storrie, G. T. Clark, F. B. Goedike, W. R. Worthington.

AMES—ARTHUR JOHN, of 184 Centre Street, Ottawa, Ont. Born at London, England, Sept. 25th, 1880; Educ., City of London College, London ,England. 4 years special training under Frank C. Watts, senior partner, E. R. Watts & Son, Surveying and Scientific Instrument Mfrs., London, England; 7 yeras, sales engr., E. R. Watts & Sons, London, and 9 years, managing director, E. R. Watts & Son, Canada, Ltd., in full charge of the Canadian Business now known as "Instruments Limited.

References: G. B. Dodge, N. J. Ogilvie, J. L. Rannie, O. S. Finnie, F. G. Smith, F. S. Keith.

ARNOLD—NORMAN JOHN, of 722-6th Avenue West, Calgary, Alta. Born at London, England, Jan. 1st, 1891; 1908, rodman and leveller, C.P.R location; 1910, instr'man., mtce. of way, G.T.P. ; 1911, constrn., C.P.R. Transcona; 1912, instr'man. in charge of track laying, G.T.P.; 1912, rodman, C.P.R., D.N.R.; 1913-14, instr'man and dftsman., irrigation branch, Dept. of the Interior; instr'man. Can. Land and Irrigation Co., Medicine Hat, Alta.; At present, Instr'man., Lethbridge Northen Irrigation District, Lethbridge.

References: C. M. Arnold, P. M. Sauder, F. M. Wood, G. N. Houston, F. K. Beach.

BAIRD—ALBERT FOSTER, of Fredericton, N.B. Born at Salmon Creek, N.B., Dec. 6th, 1891; Educ., B.Sc. 1914, M.Sc. 1917, Univ of N.B.; Student ap'ticeship course, Ca.n Westinghouse Con., Hamilton, during vacations; 1915-16, instructor in physics, Kansas State College; instructor in physics, Macdonald College, Ste. Anne de Bellevue; 1916-19, acting professor of mech. engr'g., Univ. of N.B. 3 years and 2 mos. in charge of this dept.; Summer 1920, engr'g. office, Northern Electric Co., Montreal; 1920 to date, professor of physics and electrical engr'g., Univ. of New Brunswick, Fredericton, N.B.

References: E. O. Turner, J. A. Stiles, F. P. Vaughan, C. O. Foss, B. M. Hill, T. W. Lesage.

BOCKUS—GERALD LETHWYN, of 26-A Wolfe Street, Sherbrooke, Que. Born at Mystic, Que., Sept. 21st, 1885; Educ., I.C.S. elec engr'g., 1907; Served ap'ticeship and later in elect'l dept. (power plant division), Hartford Street Rly. Co.; 1906, inspr. of plant equipment, elec.dept., Montreal Locomotive Works: 1907-09 foreman, Shawinigan Water & Power; 1909-11, travelling salesman; 1911-12, supt., elec. dept., Canada Paper Co.; 1912-14, erecting engr., Canadian Westinghouse Co.; 1914-15, plant engr., McCormick Mfg. Co., London, Ont.; 1915-16, erecting engr., Canadian Westinghouse Co.; 1916-17, in charge of power house and elect'l. equipment, McGill University; 1918 to date, supt. of power, City of Sherbrooke, Que.

References: C. J. Desbaillets, H. Holgate, L. A. Herdt, R. S. Kelsch, J. M. Robertson, J. C. Smith, M. A. Sammett, F. Thomson, T. Tremblay.

BOYD—JOHN WILLIAM GAMBLE, of 35 Elgin Avenue, Toronto, Ont. Born at Teddington, England, Feb. 10th, 1897; Educ., Toronto Technical School (elec. engr'g.); 1916-18, overseas, Flight Lieut., R.F.C.; 1918 (Aug. Nov.), 1st. asst., tech. dept., Canadian Aeroplanes; 1919-1920, organized and in charge of repair dept., Can. Gen. Elec. Co., Toronto. Asst. to supply dept. engr., Lamp Base Works (C.G.E. Factory); Completed survey with Northern Development Branch in October 1921.

References: C. H. Fullerton, M. B. Watson, R. O. Wynne-Roberts, J. C. Meader, W. Storrie.

BRABAZON—CLAUDE HUGH, of Ottawa, Ont. Born at Portage du Fort, Que., Oct. 18th, 1886; 1905-06, asst. in charge of sub party on Alaska Boundary Survey; 1907-08, in charge of sub party on Yukon Boundary; 1909-13, Maine and N.B. Boundary; 1914 to date, engr., in charge of primary triangulation party, Maritine Provinces, for Geodetic Survey of Canada, Dept. of the Interior, Ottawa.

References: J. J. McArthur, N. J. Ogilvie, J. D. Craig, W. M. Tobey, F. B. Reid, D. H. Nelles, C. R. Coutlee, A. M. Grant.

CANNIFF—STANLEY W., of 6 Second Avenue, Ottawa, Ont. Born at Napanee, Ont., Aug. 27th, 1885; Educ., Senior Matric., Napanee Collegiate Institute. I.C.S.; 14 years with the Can. Gen. Elec. Co. as follows — 4 years course in elec. engr's. Peterboro, 2 years supt. of transformer testing dept., Peterboro, 4 years in engineering dept., designing direct current machines, transformers and station layouts, 2 years asst. supply dept. engr., Toronto, and 2 years in the sales dept., Toronto; 7 years to date, test engr., Ottawa Hydro-Electric Commission, Ottawa.

References: J. E. Brown, P. L. Allison, C. E. Sisson, L. De W. Magie, J. H. Thompson, A. B. Lambe.

CLARK—FRANK JAMES, of 212-11th Street South, Lethbridge, Alta. Born at Amherst, N.S., March 31st, 1889; Educ., 2 years McGill Univ.; 1906, with Mountain & Milling Co., Isaac's Harbour, N.S., 1906-12, with G.T.P. Rly., 1910-12 in charge of concrete and timber bridges on mountain divn. west of Edmonton, Alta.; 1912-14, in charge of work on E.D. & B.C. Rly. at Mirror Landing and High Prairie, Alta.; 1914-19, overseas; 1920 to date, res. engr., Lethbridge Northern Irrigation District, Lethbridge.

References: H. B. Muckleston, C. M. Arnold, R. J. Gibb, F. S. Dyke, P. M. Sauder.

CUNHA—STANLEY HERBERT, of Montreal, Que. Born at Kingston, Jamaica, B.W.I., Feb. 15th, 1882; Educ., B.Sc., McGill Univ. 1905; 1899-1901, ap'tice, Royal Naval Dockyards, Port Royal, Jamaica; 1906-07, test dept., General Electric Co., Schenectady; 1907-09, Jamaica Co., central factory work; 1909-12, test dept., and from 1912 to date, engineering dept., Montreal Light Heat & Power Co., Montreal. At present, elect'l. engr.

DOGHERTY—ALEX. CHARLES, of Montreal, Que. Born at Montreal, Sept. 6th, 1891; Educ., I.C.S. elec. engr'g.; 1908-10, shops, offices and dfting room, Northern Electric and Mfg. Co.; 1910-11, dftsman and switchboard erection, Allis-Chalmers Bullock, Rockfield, Que.; 1911-13, dftsman. and asst. engr. and 1913-14, elec. engr., T. Pringle & Son Ltd., Montreal; 1914-15, designed and supervised constrn. pumping and elect'l. equipment for the Corby Distillery Co. Ltd., Corbyville, Ont.; 1915-17, overseas; 1917 (May-Dec.), res. engr. on hydro-elec. development for Penman's Ltd., Coaticook, Que. under T. Pringle & Son; 1918, elec. engr., with Wayagamack Pulp & Paper Co., Three Rivers, Que.; Jan. 1919 to date, elect'l. and mechanical engr., T. Pringle & Son Ltd., Montreal.

References: J. S. Costigan, G. M. Wynn, A. H. Milne, P. O. G. Janes, A. Pringle.

DOW—JOHN, of Lethbridge, Alta. Born at Whitehouse, Aberdeenshire, Scotland, May 6th, 1879; Educ. elec. engr's. course, Robert Gordon's College, 1903-04. Special engr'g. course (9 mos.), Automatic Electric Co., Chicago, Ill.; 1904-09. served ap'ticeship. in all branches of telephone engr'g., National Telephone Co.; 1909-12, install'n. of automatic telephone switchboards etc., Automatic Electric Coy., Chicago, Ill.; 1912 to date with Alberta Govt. Telephones, at present plant chief.

References: S. G. Porter, C. M. Arnold, C. D. MacKintosh, G. N. Houston, H. W. Meech.

DRYBROUGH—JOHN, of 14 Charles Street East, Toronto, Ont. Born at Leith, Scotland, Aug. 5th, 1896; Educ: At present in 4th, year, Faculty Applied Science, Univ. of Toronto; 1913-15, asst. chemist, Mond Nickel Co. Ltd., Coniston, Ont.; 1916-19, overseas; 1920 (May-Aug.), British American Nickel Corpn., Nickelton, Ont.; 1921 (May-Sept.), asst, Can. Geol. survey party.

References: C. H. Mitchell, C. R. Young, H. E. T. Haultain, P. Gillespie, J. R. Cockburn.

ELLIS—OWEN WILLIAM, of 539 Church Street, Toronto, Ont. Born at Swindon, England, Sept. 22nd, 1888; Educ:, B.Sc. 1914, M.Sc. 1917, Birmingham Univ.; Assoc. M. Inst. C.E. 1915; 1905-10, ap'tice, Gt. Western Rly. Locomotive Works, Swindon, England; 1910, machinist, and 1910-11, educational instructor (under supervisor of apprentices), C.P.R. Angus shops, Montreal; 1914-15, supervisor (asst. to mgr.), 1915-16, prin. asst. metallurgist, and 1916-21, metallurgist, Royal Laboratory Dept., Royal Arsenal, Woolwich, England; At present, lecturer on metallography and on iron and steel, Univ. of Toronto, Toronto. Also consltg. metalluragical engineer.

References: C. H. Mitchell, H. E. T. Haultain, A. Stansfield, P. B. Roberts, J. Griffith, W. J. Smither, C. R. Young, P. Gillespie.

FIELD—REGINALD HUGH, of 12 Rockcliffe Way, Ottawa, Ont. Born at Rotherfield, Sussex, England, Jan 11th, 1890; Educ. 1st class cert., Univ. of Liverpool, 1913; 1906-10 and during vacations premium ap'tice, London & North Western Rly., England; 1913 (2 mos.), dftsman., Dom. Bridge Co., Lachine; 1913-14, inspr. for the Can. Inspecting and Testing Laboratories; 1914 to date, at the Surveys Laboratory, Dept. Interior, Ottawa, examining, testing, adjusting and reporting on various engineering instruments etc., under direction of W.C. Way.

References: W. C. Way, J. J. Rannie, S. W. Perrott, E. M. Dennis, G. B. Dodge, H. A. Dupre.

HENDERSON—MELVILLE GRANT, 533-7th Street South, Lethbridge, Alta Born at Tara, Ont., Sept. 27th, 1895; Educ., B.A.Sc. Univ. of Toronto, 1920; 1916-19, [illegible], 4 mos., constrn. of hydro-elec. [illegible], Ont.; 4 mos., shell manufacture, 1915; 1921 (5 mos), field office work and instrument work, Lethbridge Northern Irrigation District, Lethbridge, Alta.

References: L. M. Arkley, P. Gillespie, P. M. Sauder, F. S. Dyke, H. B. Muckleston.

HILLIARD—GEORGE FREDERICK HERBERT, of Lethbridge, Alta. Born at Minnedosa, Man., March 13th, 1888; Educ., Grad. R. M. C. Kingston, 1908; 1908, topog'r., Militia Dept.; 1909, prospecting, Gowganda and Northern Ontario; 1910, topog'r., Militia Dept.; 1910-11, leveller, prelim. and location survey, 1911-12, instr'man. on constr'n., Algoma Central & Hudson Bay Rly.; 1913-15, asst. engr. to city engr., Peterborough, Ont.; 1915-19, overseas, C.F.A.; April 1920 to date, res. engr., Lethbridge Northern Irrigation District.

References: P. H. [illegible], H. B. Muckleston, C. M. Arnold, P. M. Sauder, F. S. Dyke.

LACKYER—RICHARD HENRY NORMAN, of Bonnington Falls, B.C. Born at Vancouver, B.C., Nov. 5th, 1893; Educ., 3 years science, McGill Univ. Master of Electricity, State of West Va. Univ., 1914; 5 years, in charge of elec. install'n. in connection with the Hudson's Bay new store, Vancouver; 1915-18, in charge of the install'n. and operation of 20,000 horse power plant for the Consolidated Mining & Smelting Co., Trail, B.C.; 1918-21, in charge of the West Kootenay Power & Light Co's. interests at Trail, B.C.; May 1921 to date, asst. supt. of the West Kootenay Power & Light Co's. generating actions, Trail, B.C.

LESSARD—C. CAMILLE, of 1 Avenue Jacques Cartier, Quebec, Que. Born at Quebec, Que., Sept. 26th, 1889; Educ., B.S.A. and C.E., Laval Univ. 1911; During College vacations, rodman etc., on location and constrn., T.C.Rly., and junior asst. on staff of A. R. Deary, Dept. P.W. Canada, Quebec,; 1911-15, asst. to the district engrs., Dept. P.W. Canada, Quebec; 1915-17, city engr., Levis, Que.; 1917-19, engr. for the town of Bienville, Que.; 1919 to date, in private practice with C. E. Gauvin, C.E., Quebec, Que. (During winter 1922, asst. to chief engr., I. E. Vallée, Public Works and Labour, Quebec.

References: A. R. Decary, C. E. Gauvin, I. E. Vallée, A. B. Normandin, J. A. Buteau, E. S. T. Lavigne, J. N. H. Cimon, F. B. Painchaud.

MACFARLANE—ATHOL HERRIDGE, of Baghdad, Mesopotamia. Born at Ottawa, Ont., 1891; Educ., 3 years S.P.S. Univ. of Toronto; 1906, Yukon Govt. Survey; 1907, road constrn., Y.T.; 1908, firing, operating and constrn. foreman, Joe Burke Mining Co., Y.T.; 1909, electrician, Guggenheims, Y.T.; 1910, electrician,constructional foreman, Northern Light Power Co. — Bonanza Basin Gold Dredging Co. — North Fork Power Co., Y.T.; 1911-12, constructional engr. (elec.) Bonanza Basin Gold Dredging Co.; 1913, B.C. Electric Co., Victoria, B.C.; 1913, Canadian Collienie (D) Ltd., in charge elect'l install'ns. No. 4, Vancouver Island; 1914, bridge inspr., Sask. Govt.; 1915-19, overseas. Awarded M.C.; 1919-20, elec. and mech. surveyor for D.S.C.R., Vancouver; 1920 to date, asst. director of irrigation, Baghdad, Mesopotamia.

References: G. B. Hull, H. D. St.A. Smith, L. W. Klingner, H. C. Lott, H. S. Carpenter.

MARSHALL—NATHANIEL, P. O. Box 307, Lethbridge, Alta. Born at Belfast, Ireland, Oct. 25th, 1862; Educ., 6 years ap'ticeship to engr'g., at same time attending night classes at Technical School. 1st class cert. British Board of Trade, 1888; sailed as 3rd, 2nd, and 1st engr., in various ships; 10 years and 3 mos., engr. surveyor, under Lloyds Rules; 1906-07, machinist and inspr., C.N.R.; 1908 (6 mos.), master mechanic, Hillcrest Collieries Ltd.; 1908 to date, inspr. of boilers, Alberta Govt., Lethbridge, Alta.

References: G. N. Houston, S. G. Porter, H. W. Meech, C. D. MacKintosh, P. M. Sauder.

McLEAN—HENRY JOHN GISBORNE, of Brantford, Ont. Born at Brantford, June 6th, 1888, Educ., I.C.S.; 1904-08, ap'ticeship. in factory and drawing office, 1908-10, in drawing office, and 1910-15, chief dftsman., Waterous Engine Works Co. Ltd. Brantford; 1915-19, overseas, Major, Awarded M.C.; 1919-20, deputy asst. director, Eastern Ontario Dept. S.C.R.; 1920-21, paper making machinery and hydraulic turbines, Dominion Engr'g. Works; At present assisting in the local division Court House.

The Lignite Briquetting Plant, Bienfait, Sask.

Importance of developing lignite as commercial fuel in Western Canada, research work by Lignite Board, details of experimental work.

E. R. Woodward, Jr.E.I.C.

Paper Awarded Students' Prize, 1921

At a recent sitting of the United States Senate, referring to national coal consumption, Senator Calder, Chairman of the Committee on Reconstruction and Production, said:

"The waste alone in burning raw coal makes us stand aghast, perhaps another generation will have the foresight and courage to obtain the full value from each pound of coal."

This utterance is typical of the views held by the most far sighted present day economists. That the Canadian Government is fully alive to these facts is proved by the erection of the Lignite Briquetting Plant just completed in the Souris coal mining area of Southern Saskatchewan. The object of the plant is to make possible the efficient utilization of the vast low grade lignite resources of the Canadian Middle West.

Historical Note

In the year 1852, Hugh Sutherland, now Chairman of the Western Dominion Collieries, while on a prospecting trip in Southern Saskatchewan, heard strange stories from the Indians of the district about a place known to them as the "Valley of Fire".

On investigation of this alleged phenomenon the ground itself was actually found to be blazing in patches of considerable area along the valley of the Souris River. Mr. Sutherland's guides assured him that these fires had

burned continuously, winter and summer, for many years. The white man's conclusion was that he had thus most unexpectedly discovered surface outcroppings of coal. He immediately sent word to Government authorities at Winnipeg of the discovery of coal in Southern Saskatchewan only to be ridiculed by them for his trouble. Having the courage of his convictions, however, he spent the winter building a barge. In the spring of the following year when the frost had been thawed from the ground sufficiently to make digging possible he filled his barge with the new found coal, and commenced a five hundred mile journey via the Souris and Red Rivers to Winnipeg.

Such was the signal which precipitated an extensive migration of prospectors to the Souris district, and today lignite mines in great numbers rear their blackened tipples skywards throughout this part of the country.

Lignite Coal

Lignite is a low grade coal, which, in its natural state, is by no means an ideal fuel, either for domestic or commercial purposes. In the Middle West of both Canada and the United States it has been used extensively for many years on account of its abundance and consequent cheapness.

Following are some of the most marked objections to the use of raw lignite coal as a fuel:—

(1) It has a high moisture content, 30% to 35% (Anthracite contains from 1% to 5% of moisture). This increases the cost of transportation since the great amount of "water of composition" is later evaporated at the expense of the heat value of the coal itself.

(2) Lignite is a friable material. It is only suitable for fuel when freshly mined, as it disintegrates rapidly on exposure to the air.

(3) It has a low calorific value, 6,600 to 7,000 B.T.U's. per pound. Anthracite gives 12,000 to 12,800 B.T.U'S. per pound.

Work of the Lignite Board

The object of the Lignite Utilization Board of Canada is to overcome these difficulties by subjecting the coal to a process of low temperature carbonization, and then briquetting the residue. This carbonized lignite is in the form of a coke or charcoal, which, when mixed with some binding material, such as tar, or sulphite pitch, can be readily made into briquettes. These briquettes have been shown by experiment to have:

(1) A low moisture content, 0% to 6%.

(2) Great compressive strength.

(3) Ideal storage qualities: for example they do not deteriorate in contact with the air.

(4) A high calorific value, 11,500 to 12,000 B.T.U's, approximating that of anthracite coal.

In short, the low temperature carbonization method of making briquettes as carried on at the Bienfait plant demonstrates a method of converting very low grade coal into a fuel of the highest quality.

Experiments made at Ottawa on a semi-commercial scale have shown that 2¼ tons of Souris lignite yield one ton of briquettes. Coal experts throughout the whole North American continent are looking to the new plant in Southern Saskatchewan for proof that this important chemical experiment can be made a commercial success.

Lignite Deposits

A recent article in the "Scientific American" gave the following data on lignite coal:—

"Underlying the province of Saskatchewan and reaching Southward into the United States are immense deposits of poor lignites. These beds cover more than 13,000 square miles, and are estimated to hold 58,812,000,000 tons of the fuel. The lower seam of these lignites is deemed commercially the more important, for it attains a thickness of 8 feet, yielding 11,000 tons per acre, or substantially 10,000,000 tons to the square mile. Better lignites and bituminous coals occur in Alberta."

The great importance to Canada of the utilization of her Saskatchewan lignites is emphasized by the fact that the whole country, from the bituminous coal deposits of the Maritime provinces to those of Alberta and British Columbia, is devoid of coal other than these low grade lignites.

As a result of this dearth of good coal in the Middle West, and also the absence of any considerable amount of anthracite in the Dominion as a whole, Canada today imports 50% of her coal supply from the United States. The Canadian consumer is thus compelled to pay a very high price for his fuel.

Under these conditions it is at once apparent that the successful utilization of the enormous reserves of Western lignite is of paramount importance to Canada. The day may not be far distant when the United States will discontinue their present large exports of coal to this country. Now is the time therefore for the Dominion to make herself self-supporting in the matter of her fuel supply, and the opening of the new plant at Bienfait is, we hope, the dawn of that era of independence.

Creation of the Lignite Utilization Board

Researches on lignite were commenced early in 1917 by the chemical staff of the Fuel Testing Division of the Mines Branch, Department of Mines, Ottawa. In the summer of 1918 the Lignite Utilization Board of Canada was created by an Order in Council of the Dominion of Canada, supplemented by an agreement as to finances with the provincial Governments of Manitoba and Saskatchewan. The Board immediately made a series of laboratory investigations at the Fuel Testing Station of the Mines Branch, carrying on and completing the work already commenced.

Erection of the Plant

In the summer of 1920 work was commenced at Bienfait, the location surveyed, and the ground prepared for

the erection of the plant. Passing over the earlier stages of construction, let it suffice to say, that by May 1921 all the main buildings, and the greater part of the work were finished.

The two chief items of equipment yet to be installed were:

(1) The piping; steam, gas and water.

(2) The conveying machinery.

Some details of these will now be given, together with a description of the power house.

Power House

In the boiler room are three horizontal return tubular boilers, each of 150 B.H.P. capacity; grates suitable for burning lignite coal. The rated working pressure is 165 lbs. gauge. The boilers are connected to the main steam line by 8 inch high pressure wrought iron pipe with flanged joints, suitable reductions being made for the steam lines to the various engines.

Following are details of the power units in the engine room:—

(1) A 400 K.W. Robb Armstrong Corliss engine in direct connection with an alternating current generator having a capacity of 600 volts, 384 amps., 150 R.P.M.

(2) A Westinghouse automatic compound engine with alternating current generator; 100 K.W., 600 volts, 96.2 amps., 3 phase, 60 cycles, 300 R.P.M.

(3) A Westinghouse standard engine with direct current generator, used as an exciter to the two larger units. Capacity: 25 K.W., 125 volts, 200 amps, 375 R.P.M.

Conveying Machinery

The conveying machinery installed at the plant falls under the following four heads:—

(1) Bucket elevators.
(2) Steel apron or "finger and flight" conveyors.
(3) Belt conveyors.
(4) Screw conveyors.

Bucket Elevators

These consist of endless chains provided with "V" shaped steel buckets spaced at short equal intervals. The steel casings are built in sections, and are provided with inspection doors at the base.

Apron Conveyors

The steel apron consists of two strands of roller chain between which are bolted double beaded steel flights. These flights overlap, thus making a tight apron. The flights are provided with steel ends which, in conjunction with the apron, form a continuous moving trough. The corrugated effect of the double beaded flight serves as a check against the flow of the material when the apron is inclined.

Belt Conveyors

The three pulley carrier has three outside troughing pulleys, and a central pulley which revolve on three separate spindles. The contour of the spindles in the assembled carrier thus approximates the troughing contour of the belt, thereby permitting of no wear due to slipping. For carrying coal the maximum speed of a 10 inch belt conveyor should be about 250 feet per minute.

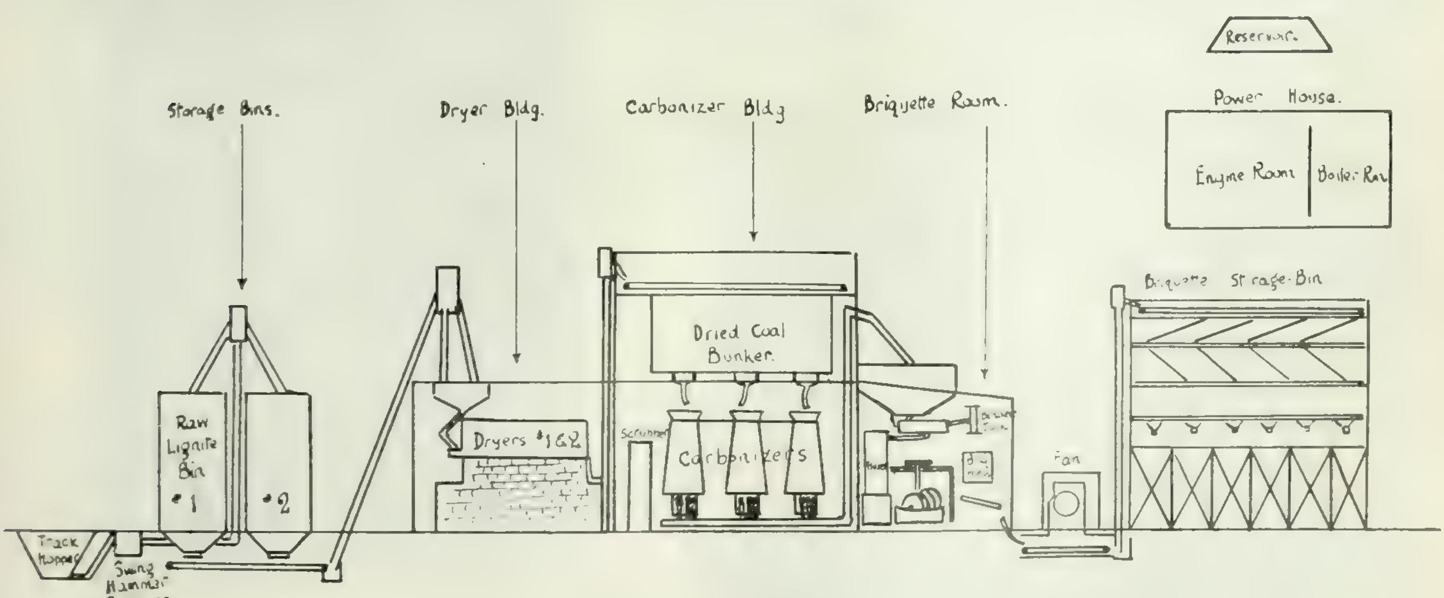

Figure 1. Flow Sheet.

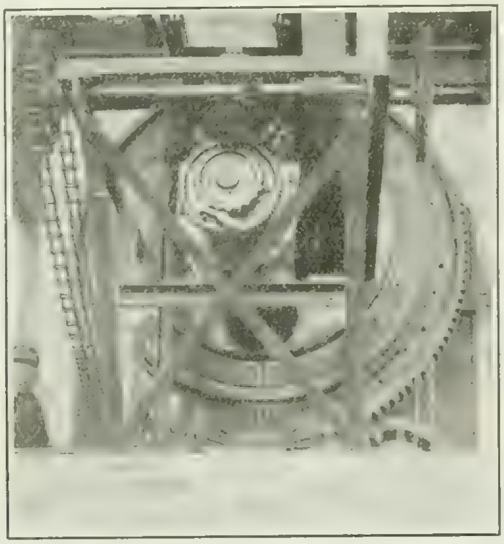

Figure 2. Dryer Mechanism.

Operation

The flow sheet will serve to illustrate the following general description of the plant, and the process involved.

The raw lignite is first dumped from incoming railway cars into the track hopper, whence it is carried by an inclined steel apron conveyor to a swing-hammer crusher (details of the crusher are given later). This pulverizes the coal to a maximum size of $\frac{1}{8}$ inch diameter.

A vertical "V" bucket conveyor raises the crushed coal to the top of the two storage bins into which it is allowed to fall. Each of these bins has a conical shaped floor which converges at a 60 degree angle to a small discharge spout in the centre. A belt conveyor carries the discharge to the foot of an inclined bucket conveyor which elevates the crushed raw coal to the bins over the dryers. From these bins the coal is fed through a chute and screw conveyor into the dryers.

Drying the Lignite

The two dryers are huge steel cylinders, each one weighing 40 tons, length 65 feet, diameter 6 feet. They rotate on inclined axes; this affords a gravity discharge of the dried coal at the rear end. Angles are rivetted longitudinally inside the shells, their effect being to lift the coal and stir it up as the dryers rotate. This stirring process assists dehydration. The dryers are heated by hot gases from the downtake of the carbonizers. A furnace is also provided under the feed end to act as an auxiliary heater or to be used when starting up the plant. The dryer cylinders are built in four quadrants. The object is to increase the heating surface by giving the hot gases free access to all parts of the shell.

Feed to Carbonizers

The dried coal leaves the rear end of the dryers by screw conveyors, it is then elevated in a vertical bucket conveyor to a horizontal screw conveyor which feeds the coal into a large bunker above the retorts. It may be noted that in cross section this bunker has the shape of the catenary curve; the shape affords cheap construction and is well suited to requirements. An objection to the design is that the bunker has a capacity many times greater than the carbonizers can take care of.

Carbonizing Retorts

The coal is fed through a flexible spout into the carbonizing flues of the inclined retorts. These flues have iron baffles projecting downwards at regular intervals to insure an even depth of coal throughout the whole flue, and to stir the coal during its passage downward. This depth is only $1\frac{1}{2}$ to 2 inches, the object being to have the whole of the charge as near as possible to the heating surface. The latter consists of carbofrax slabs which form the base of the carbonizing flue. In this way uniform heating of the whole mass of coal is obtained, a feature necessary to effective carbonization.

A temperature of about 600° C., has given the best results in experiments made to date. Whether or not that same temperature will prove to be satisfactory with these commercial size carbonizers is a point to be decided after the plant has been in operation for some time.

The 45 degree slope of the carbonizing retorts is slightly steeper than the natural angle of slope of the powdered lignite, and gives rise to a slow gravity flow of the coal down the carbonizing flue into the discharge hoppers.

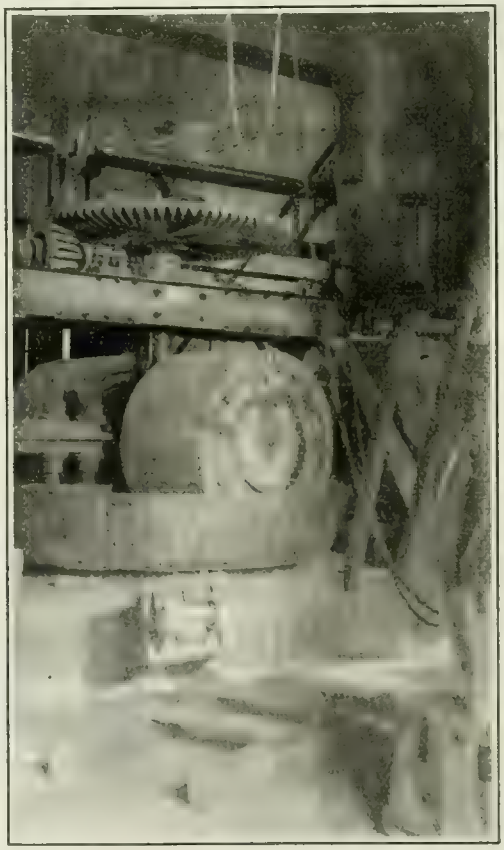

Figure 3. Chilian Mill and Fluxer

Discharge from Carbonizers

The discharge hoppers are air tight. Inside they have a jet which sprays cold water on the hot residue before it passes through to the screw conveyor. Each hopper is fitted with a pyrometer for temperature control. The gate valves on the hoppers have to be calibrated by trial in order to determine the rate of discharge which will give the most complete carbonization. This is a point at which chemical control plays a very important part.

The carbonized residue now travels by a screw conveyor, then by a "V" bucket elevator to a large bin above the briquette room.

Addition of Binding Material

From the bin just mentioned the carbonized residue runs into a mixer. At the same time a definite proportion of tar or sulphite pitch is added from a small tank. The mixer is a large horizontal trough, about 10 feet long and 18 inches wide, containing a special screw conveyor fitted with helical blades which give a mixing motion to the residue and pitch.

The mixture now passes into the fluxer: a vertical cylinder, about 12 feet by 4 feet, fitted with arms which rotate on a central shaft. The rotating arms mesh with stationary arms which project inwards from the sides of the shell.

The next unit is a special Chilian mill which is intended for use *not* as a crusher but as another mixer.

Making the Briquettes

After further treatment in another horizontal mixer, the coal is elevated and passed through the briquetting press: two heavy rollers indented with small egg shaped cavities. The briquettes are discharged on a shaking bar screen which separates the fines. This dust falls on an apron conveyor which returns it to the press, and thus obviates waste.

From the bar screen the hot briquettes are discharged to the cooling conveyor: a steel apron or "finger and flight" conveyor which runs along a tunnel under the floor of the briquette room, and to the foot of a bucket elevator outside the building. A large fan driven by a motor supplies a cold blast of air to the cooling conveyor.

The cold briquettes are elevated to the top of the storage bins, where a belt conveyor carries them along to be dropped through openings into the bin below. A railway track enables cars to be loaded with briquettes from chutes in the storage bin. The full cars are then weighed on the track scales, and shipped out for distribution.

Following the above general account of the plant, a more detailed description will now be given of:—

(1) The Crusher
(2) The Carbonizer.
(3) The Gas Scrubber.

The Swing Hammer Crusher

A crusher of this type is adjacent to the track hopper the raw lignite is fed into it by an inclined apron conveyor. The coal is reduced by being struck while in suspension. It enters the machine near the top, and, in falling comes in contact with the rapidly revolving hammers which drive the lumps of coal against the breaker plates. From these plates the particles rebound again into the path of the hammers.

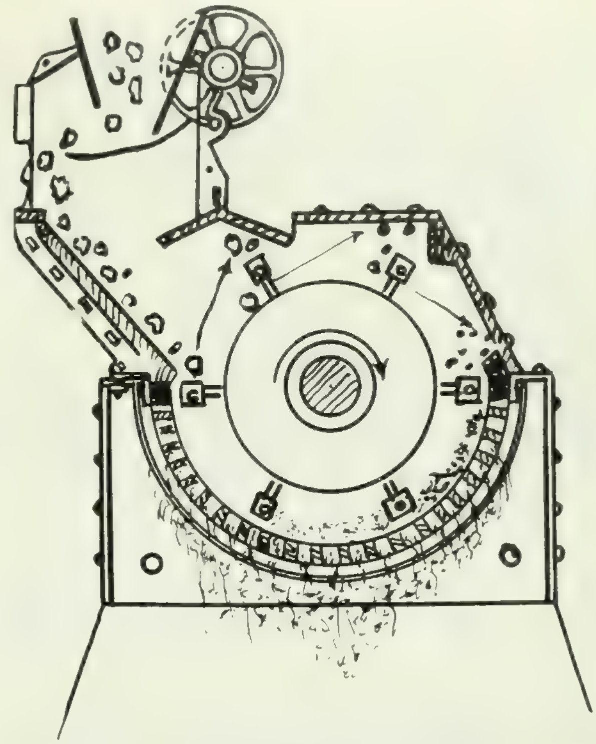

Figure 4. Swing Hammer Crusher.

Fineness is to a large extent determined by the intensity of the blow, hence different degrees of reduction may be had by varying the peripheral speed of the hammers. Coal fed from above falls down a sloping breaker plate where it is engaged by the rapidly revolving hammers. The partially reduced material passes over the cage of screen bars, and all that is sufficiently fine falls through. The residue is carried round the machine for a second operation. The hammers are made of manganese steel, and are double ended so that they can be reversed end for end when worn. Provision is made for removing and replacing the hammers through a door in front.

The best results are obtained when the coal is dry, and in lumps not greater than 3½ inches diameter; with the hammers revolving at 1,000 to 1,200 R.P.M.

Carbonization

Experiments on the carbonization of Western lignites were carried out by Messrs. Stansfield and Gilmour. An account of their work appeared in the "Transactions of the Royal Society of Canada",1918, vol. XII, and is as follows:

"The apparatus designed for these tests embodies three important features:—

(1) An accurate temperature control.

(2) The reduction, as far as possible, of the temperature lag from the walls to the centre of the charge.

(3) The complete removal and easy collection of the tar vapours.

"The temperature control is effected by the use of an electrically heated lead bath B, with suitable thermal insulation. The bath rests on a moveable platform which

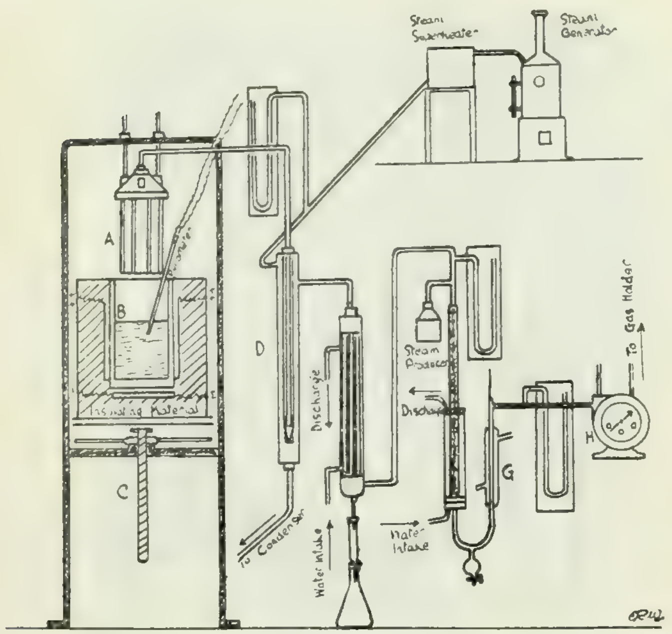

Figure 5. Apparatus for Lignite Carbonization.

can be raised by a screw C. The temperature is observed by means of a pyrometer, and regulated by switches and a rheostat.

"The reduction of lag is brought about by the use of a tubular retort A. This consists of 7-12 inch lengths of 2 inch boiler tubing mounted into a common cast iron head. No part of the charge is thus more than 1 inch from the walls of the retort.

"The method employed for the collection of the tar is as follows:—The hot gases leaving the retort pass down through the centre tube of a small scrubber D made of iron pipe, and containing three interlacing coils of wire passing up again through a surrounding annular space, the whole being jacketted with superheated steam. The heavy tar oils are here condensed in a practically water-free condition, and drop into a weighed glass beaker. The lighter oils, steam and gases pass on and down through a simple tubular condenser, where the two former condense and collect in a receiver. The oils float on the water, showing only a slight tendency to emulsify.

"The coal gases leaving the condenser still contain some tar fog. They are therefore passed down through a tube scrubber filled with glass beads (and a short layer of glass wool shown shaded in sketch), through which a jet of stream from a weighed boiler is also passed. The bottom half of this scrubber is water cooled. It completely removes the tar fog from the gas. The oil first condensed on the beads acts as an oil scrubber, collecting more of the tar. The steam prevents the clogging of the scrubber by keeping the tar hot and fluid, also when condensing at the bottom it carries down with it any vapours still remaining. The gases are thus completely cleaned, and all the liquid products as well as the ammonia from the lignite are collected in the vessels, and can be redistilled without excessive bumping or frothing, The gases leaving the scrubber F pass through a final cooling tube G, through a gas meter H and into a gas holder."

Design of Commercial Carbonizer

Following further investigation along the lines indicated above, Edgar Stansfield, M.E.I.C., in January 1921 contributed an article to the Journal of Industrial and Engineering Chemistry of which the following is an excerpt:—

"The design of the carbonizing retort consists essentially of a strongly heated surface or retort floor inclined at an angle of 45 degrees, slightly steeper than the angle of repose of the crushed lignite. The material to be treated flows down the heated surface from a hopper at the top passing under a succession of baffle plates which control the thickness of the layer. The rate of flow of the material is controlled entirely by the rate of withdrawal from the bottom of the retort.

The retort is suitably enclosed at the sides and top; gas offtakes are provided in the cover. The thickness of the layer is controlled by the difference between the slope of the retort and the angle of repose of the coal; by the distance between successive baffles, and by the clearance between the baffles and the retort floor. The material is stirred repeatedly by its passage under the baffles.

The heated surface may be heated from below with gas. It should be hottest at the bottom of the retort and progressively cooler towards the top.

The regulation of the degree of carbonization of the lignite is entirely controlled by the time of its passage through the retort, that is, by the rate of withdrawal from the bottom."

The Gas Scrubber

A centrifugal scrubber is used to recover the coal tar from the gases given off by the lignite during carbonization. The washing medium is fed in at the top, and is carried by means of the bevel division plates into the distributing cone, where it is immediately driven by centrifugal force through the deflectors in the form of a fine spray. The deflectors rotate at a speed of about 350 R.P.M. As the drops of hot water travel with high velocity from the points of the deflectors, they strike the side of the scrubber with a strong impact, rebounding at an angle, and so causing more intimate contact with the ascending gas. The washing medium passes from plate to plate, and from cone to cone. As the shaft revolves the deflectors have a sweeping effect imparting to the gas a centrifugal motion, and thereby increasing its length of travel

Utilization of By-Products

For the present it is not proposed to develop the by-products from the lignite at the Bienfait plant. The offcoming gases, however, are used as a fuel under the carbonizing retorts. Those gases are first passed through the scrubber which removes the mechanically carried particles of tarry acid. They are then fit for fuel. The calorific value of the gas averages above 400 B.T.U's. per cubic foot and more than enough gas is volatilized during the carbonization of one ton of lignite than is required to carbonize the next ton.

Chemical Control

No description of the plant would be complete without a reference to the work done in the chemical laboratory, and its important rôle in the direction and control of the whole process.

Sampling

A representative sample is taken of each car load of coal as it comes in from the mine. It is first taken to the sample room where it is crushed in three stages:—

(1) Small size Gates jaw crusher.
(2) Coffee mill.
(3) Abbé standard laboratory ball mill.

The sample is then quartered through a riffle, put into an air-tight labelled bottle, and taken to the laboratory. It is now ready for analysis.

Analysis

The following analytical determinations are made on the raw coal samples:—

(1) Moisture
(2) Ash
(3) Volatile hydrocarbons
(4) Calorific value.

Fixed carbon is estimated by difference: the sum of the percentages of moisture, ash, volatile matter and fixed carbon being 100. The fuel ratio $= \frac{\text{F.C.}}{\text{V.M.}}$ and it furnishes a good indication of the quality of the lignite from which the sample was taken.

Proximate Analysis

An average proximate analysis of a great number of samples of Saskatchewan lignites is as follows:—

Moisture	Ash	V.M.	F.C.	Fuel Ratio
26.13%	6.86%	28.11%	38.16%	1.35

Moisture

About 1 gram of the sample of powdered lignite is weighed out in a tared capsule with a tight fitting lid. The capsule of coal with the lid off is then heated for an hour in a toluol oven (toluol boils at 110 degrees centigrade, and a jacket surrounding the oven is kept filled with toluol vapour, thus giving a constant temperature). After cooling in vacuo in a desiccator, the sample is weighed again, and the percentage loss of weight is calculated. This gives the moisture content of the raw coal.

Ash

A one-gram sample of the raw lignite in a porcelain crucible is incinerated in a "Hevi Duty" electric furnace for four to five hours at a temperature of 2,000 degrees fahrenheit. The residue is cooled and weighed, and the percentage of ash calculated.

Volatile Hydro-carbons

As this is merely an empirical determination, results depend largely on manipulation, and on the type of apparatus used. The 1899 method of the American Chemical Society is as follows:—Place one gram of fresh, undried powdered coal in a platinum crucible weighing 20 or 30 grams, and having a tightly fitting cover. Heat over the full flame of a bunsen burner for seven minutes. The crucible should be supported on a platinum triangle with the bottom 6 or 8 centimetres above the top of the burner. The flame should be fully 20 centimetres high when burning free, and the determination should be made in a place free from draughts. The upper surface should remain covered with carbon. To find volatile combustible matter, substract the per cent of moisture from the loss found here.

Calorific Value

This is determined by the use of the Emerson Fuel Calorimeter. This consists of a strong steel receptacle called a bomb in which the combustible is placed and completely burned in an atmosphere of oxygen. The oxygen is under high pressure thus ensuring complete combustion. The fuel is ignited by means of a fuse wire dipping into the sample, the wire being brought to incandescence by the passage of an electric current.

During combustion the bomb is entirely immersed in a known amount of water, the rise in temperature of the water is accurately measured.

Then —

Heat units given off = rise in temp. x (Weight of water + C)

Where C = calorimeter equivalent.

The heat units can then be converted to B.T.U's. per lb.

The sulphur content of the coal can be determined from the results of this experiment.

The following table gives the results of some actual analyses made by the writer, and shows the form of record kept of each fresh car load of lignite coal as it arrives at the plant.

Chemical Control

Samples of coal are taken at regular time intervals from several different points in the plant. These are representative of the various stages of the process. As a result of the analyses of these samples the Chemical Engineer in charge is enabled to regulate the operation of the whole plant, as for example:

Feed to dryers,
Temperature of dryers,
Feed to carbonizers,
Temperature of carbonizers,
Rate of discharge from carbonizers,

and the many other details which are necessary to the successful and efficient running of the plant.

Conclusion

In conclusion, the economic importance of the work of the Lignite Utilization Board cannot be too strongly emphasized.

So far as the coal situation is concerned, Canada is divided into three zones:—

(1) The Maritime Provinces with their bituminous deposits.

(2) The Western zone, from the semi-bituminous coal fields of Alberta to the bituminous and anthracite deposits of Vancouver Island.

(3) The central zone — comprising the Prairie Provinces — which is devoid of all coal except low grade lignite.

If now the Bienfait plant can prove that it is economically feasible to briquette these low grade coals of which such vast deposits occur, the fuel problem of the Canadian Middle West will be solved. Moreover, the whole Dominion will reap enormous benefit by virtue of the fact that she will become independent of the United States from which source she at present draws 50% of her coal supplies.

The commercial experiment at Bienfait is being watched with intense interest by scientists and capitalists all over the North American continent and in Europe.

The plant is now about to commence operation, and it is hoped that the next six months will prove this process to be commercially practicable, thus demonstrating the wisdom and foresight of the Canadian Government in solving that all important problem — the efficient utilization of the vast fuel resources of the Dominion.

Actuarial Factors in the Design of Irrigation Structures.

Economics and storage works; value of storage, available storage, capacity in relation to dam height and cost, storage capacity

H. B. Muckleston, M.E.I.C.

Paper Read before Lethbridge Branch, The Engineering Institute of Canada, January 14th, 1922

"The Civil Engineer has to deal with the "unpredictable, with those forces of nature that " 'are subject to no calculation'; and still he must "predict, still calculate them at his peril..he "must not only consider that which is, but that which "may be" *Stevenson.*

In presenting this paper the author wishes to say in advance, with the object of forestalling possible criticism, that it contains little or nothing original, or that has not been said before by others better qualified to say it. Rather is it a compilation of a few well known principles which are often overlooked, or not sufficiently emphasized. Engineering literature contains countless descriptions of works built, and these descriptions often deal exhaustively with the stresses and strains and peculiarities of design. But the economic factors are seldom mentioned and hardly ever even fairly well covered.

Engineering has been defined by an authority as "The art of making a dollar earn the most interest". Another authority defines it as "The art of doing well for one dollar what any fool can do for two dollars after a fashion" While we may not agree that either definition is the whole truth, we must admit that both contain a part of the truth and nothing but the truth. In this respect irrigation works are not in any way different from other engineering operations and must necessarily follow the same economic laws. Unless they do follow them, no matter what high degree of technical skill is shown in the details or in the general plan, they are not examples of good engineering.

Before we can conscientiously consider any design the best possible design, we must satisfy ourselves that economic principles have been followed and their requirements fulfilled.

Interest on a dollar can be earned, (or saved) in two ways. The first and most obvious way is not to spend the dollar. The second less obvious way is to spend two more dollars of capital in order to save the interest on four dollars which would otherwise be spent in maintenance and operation charges.

If engineers were omniscient they could always follow exact economic principles and know they were right; but lacking that faculty they must do the next best thing. Certain basic facts are always lacking in the data of engineering studies, and in default of the facts reliance has to be placed on the probabilities based on the best information obtainable. For instance:—In the design of a bridge one of the fundamentals is the possible wind load. We have no means of knowing what wind velocity may at some future time occur at any particular site, but we usually know with more or less certainty what velocities have occurred in the past and at what intervals, and with these facts as a basis the probability of a wind of any set velocity can be calculated or at least closely estimated.

The more complete our records, the better we are likely to prove as prophets. With the probabilities calculated it is an actuarial matter to determine the justifiable present expenditure to avoid a given probable expenditure at any set time in the future.

Economic Problems

The economic problem in the design of storage works is usually studied under the following heads:—

A. Determining the economic value of storage.

B. Determining the available storage from the run-off records over a series of years.

C. Determining the capacity curve for a wide range of dam heights.

D. Determining the unit-cost curve for a wide range of capacities.

E. Determining the economic storage capacity to be developed.

The economic value of storage is a complex function of a number of somewhat erratic variables. In general the steps in the problem are, first to find what water is worth delivered at the farm. Second the cost of delivery. Third the residual, which is roughly the value of the storage. This looks simple enough; but the apparent simplicity vanishes when the different steps are tackled. It will, however, be assumed that this part of the problem has been solved, and also that the available storage has been calculated from the records, and that a table of capacities for various depths has been prepared. This brings us up to the calculation of the unit cost curve, and here the engineer's economic problem begins in earnest. The cost at any capacity is a sum of the capital cost of the works and the capitalized cost of the maintenance and operation, plus, in some cases, a further item for the renewal of the works at some future time, amortized insurance charges and some other special charges which are applicable in certain cases but not in all.

It will be assumed for purposes of illustration that the cost of storage is represented entirely by the cost of the dam and its appurtenances. If there be other works to be considered the same principle will apply. It will be necessary first to decide on the material and type of construction to be employed in the dam.

If there is any very wide variety of choice possible with the local conditions as they exist, there is a secondary economic problem involved in the choice; but if local conditions dictate the material and style of construction as they often do, the problem is simpler.

Dams have been built of earth, loose rock, masonry, either as gravity or arch dams, wood, steel and reinforced concrete; and each material introduces some secondary economic problems peculiar to itself.

If the dam is to be of earth or loose rock, a separate spillway is a necessity and a certain freeboard must be provided. The economic problem is, how much? Freeboard and spillway capacity are safety measures and both cost money. How much money is it justifiable to spend in anticipation of something happening at an indeterminate date in the future?

Spillway Provision for Floods

Spillway capacity is provided to guard against floods and freeboard is provided as bulwark against wave action and to enable the spillway capacity to be utilized. If too much of either is provided it may never be used and our dollar is not earning the most interest, if too little is provided the whole works may be destroyed and our dollar may cease to earn any interest at all.

Evidently the possible flood to be provided against is the important question in this stage of the problem. It must be considered that, given time enough, any size of flood may occur on any kind of stream. The various possible causes of high water in these lattitudes are (a) a heavy winter snowfall in the mountains, (b) a late quick Spring, (c) heavy rain on the watershed, (d) precipitation on previously saturated catchment areas, (e) precipitation in which the storm center moves down stream, (f) breaking of logs and ice jams, beaver dams, etc., (g) destruction of other storage works higher up in the valley. Any combinations of these causes may occur. Any one of these acting alone may cause high water, and possibly could, though not necessarily would, cause what might be called unusually high water, or perhaps moderate floods. Three would probably cause moderate floods, and might cause unusual floods, while all together might cause floods which could be called disastrous. The records, such as they may be, give an indication of how frequently each one of the causes, (except the two latter) is operative on the average, and by combining these frequencies we can arrive at the probability of any conjunction of two or more. For example let there be five possible events and let their frequencies, as established by a long series of observations be as follows:—

No. 1	Once in	2 years	frequency	equals	½
2	"	6 "	"	"	1/6
3	"	10 "	"	"	1/10
4	"	12 "	"	"	1/12
5	Twice in every year		"	"	2

Then the probabilities of No. 1 and No. 2 coming in the same year is 1/12; of Nos. 1, 2 and 3, —1/120, and of all five happening in the same year, 1/720. Further, suppose examination of the records shews that No. 1 happened in May on nine out of ten occasions. The probability of its occurring in May of any selected year is evidently ½ x 9/10 = 9/20. Similarly, the probability of No. 2 occurring in May of any year might be 7/60 and that of Nos. 1 and 2 occurring together in May of any year would be 63/1200.

This is the ideal method of attack in such problems, but it is seldom that it can be used, as our information in the shape of records seldom takes just this form. What the records do shew is the relative frequency of floods and high water of varying degrees of magnitude. Each high water or flood may be considered as the result of one or more causes, acting with greater or less intensity; and the frequency of the various maxima of discharge may therefore be considered as a measure of the frequency of coincidence of the various acting causes or degrees of intensity. If therefore the record of previous years is extensive enough it should be possible to calculate the probability of a flood of any given magnitude occurring in any set period. This calculation may be made by fol-

lowing the mathematical theory of probability which is a somewhat laborious business or it may be accomplished with sufficient accuracy by plotting the recorded observations on probability paper, as described by Allen Hazen, M.E.I.C. As an example:—The Ohio River at Cincinnatti has been under observation for 60 years and the records of the gauge heights so plotted shew that for 99% of those years they have exceeded 33 feet, for 90% they have been in excess of 41, for 40% they have exceeded 53, for 5% they are more than 64, and for 1% more than 69. An extension of the curve shews that a flood in excess of gauge 75 might reasonably be expected only once in 1000 years. This does not mean that such a flood will not occur next year or the year after. It is merely an indication of the reasonable betting odds on the chances which, in the long run we can afford to take.

Failing any other means of fixing the maximum flood to be provided against, recourse must be had to some of the many formulae for this purpose; but it must be emphasized that these formulae have a very limited range of usefulness and can only be applied with a very large mixture of judgment. There is one formula which is said to give good results and as it is frequently used it may be given here without apology:—"Convene an extraordinary session of the Ancient and Honourable Order of Highwater-liars and take a vote, then provide for twice as much".

Economics of Flood Preventiod

After the probabilities of any given flood discharge are determined, it is necessary to determine how much it is justifiable to spend in capital in order to avoid paying damages which such a flood might cause in the future. For instance, let it be assumed that the calculations shew that a flood of 60,000 sec. ft. might be reasonably expected on the average once in 100 years or that its probability is 1/100, 50,000 once in 20 years, probability 1/20, 30,000 probability 1/3 and so on. If this is the true law of probability, then a flood of 70,000 might be anticipated as occurring only once in 500 years and one of 80,000 only once in 5000 years. If money is worth 6% how much is it justifiable to spend on provision against floods, which otherwise might wipe out the investment? If the event may occur once in ten years, with money costing 6%, we are justified in spending about 56 cents for every dollar of investment. If it may occur once in thirty years the justifiable expenditure is about 17 cents, and if the period is 100 years it is only 3/10 of a cent. This is not quite the whole story because the failure of the dam might have consequences far beyond the mere loss of the first investment, and what must be considered is not the investment wiped out but the total of the possible damages.

Having decided on the magnitude of the probable flood to be provided for, it is next necessary to determine its duration, and the necessary flood freeboard, as measured from the storage capacity above normal H.W.M. Assume for example that the stream we are dealing with may be reasonably expected to discharge 20,000 sec. ft. and that such a flood might be reasonably expected to exceed 10,000 for a period of 48 hours. From the hydrograph of such a flood we find that the discharge during that period might amount to 60,000 acre ft. How high will the reservoir rise, assuming it was full to H.W.M. when the flood started?

By calculation it is found that the storage capacities above H.W.M. are:—

1st foot	8,000 acre feet
1st-2nd "	18,000 " "
1st-3 "	30,000 " "
1st-4 "	44,000 " "

It will be further assumed that the spillway is a simple overfall weir and that its discharge for any given head is a direct function of its length. The next step is to construct by a—trial and error—process a hydrograph for discharge of the spillway on the basis of an assumption as to length. This hydrograph together with that of the stream and the curve of storage capacities will shew how much of the flood water passes directly through the reservoir and how much goes into temporary storage, or in other words, how high the level of the reservoir will rise. It is evident that this height is some function of the length of the spillway crest and by making several such calculations a curve of flood heights can be plotted against spillway lengths, or spillway costs.

Freeboard and Wave Height

At this point it is necessary to consider the question of freeboard as affected by wave heights. It will be assumed that the general design of the dam has been settled and that we have selected an earth fill dam as the best type for the situation. The upstream slope will be assumed as 3-1. The possible wave height is a somewhat complex function of the fetch, or the longest stretch of open water over which the wind may act in a straight line. It does not appear to be affected much by the velocity of the wind, which only alters the length and velocity of the valve.

With a fetch of six miles and in deep water we might expect a wave height of between four and five feet, and if a wind velocity of 110 miles per hour is a reasonable expectation, such a wave might have a length of 70-90 feet and a velocity of 19-22 feet per second, and the pressure developed by impact of such a wave might be as high as 2500 lbs. per sq. ft. These figures are for open water; as the water shoals the waves become shorter and higher and the velocity somewhat less. For such a case as the dam under consideration a wave height of six feet is not impossible and our freeboard should be something greater than this or else a parapet of proper design should be provided. This free board must be added to the flood heights as determined above.

We are now in a position to calculate and plot a curve of costs based on various top elevations. Since these elevations have been shewn to depend on the length of the spillway crest, this curve will shew us which spillway length is the most economical in capital cost for a given capacity.

The cost of maintenance will not be a constant but will vary somewhat with the height, length of spillway, area of surface protected by rip-rap or other means, and with other factors of more or less special application.

The above analysis is based on the cost of the dam and spillway only. There may be other considerations such as relocation of railways and highways, land damages, and the effect on other developments above or below etc. Again, the cost of maintenance, which is a relatively

small matter for an earth dam or a masonry structure, may be relatively great in the case of a framed structure of steel, timber or reinforced concrete.

Storage Capacity

In some cases the real economic problem is the amount of storage capacity to be provided. So long as the run-off of the stream is in excess of any possible economic storage, the quantity to be developed is more or less closely determined by the value of the stored water. But in the reverse case where the whole run-off, even in the biggest years, could be stored at less than that value, it may not be economical to develop storage for the maximum possible quantity because that quantity occurs so seldom For instance, on a certain stream it is found from the records that the mean or average annual run-off over a long series of years is 100,000 acre feet. The maximum annual run-off during that time has been 200,000 acre feet which occurred in only one year out of the 50 for which records are available. It would hardly pay to develop storage to that capacity even if it were feasible. On the other hand a capacity of only 100,000 acre feet might be economically too small.

If the mean annual run-off be calculated for a long series of observations and the excesses or deficiencies be tabulated in order of magnitude it will generally be found that these differences, regardless of sign, vary in frequencies inversely as their magnitude. If the observations extended over a long enough period it would probably be found that these differences followed the mathematical law of error. Usually the series is not long enough on any one stream to demonstrate this, but by combining the records of several streams it may be shown that the law holds approximately, and the probability of a run-off of any magnitude may be calculated. The question then resolves itself into calculating how much it is justifiable to expend in providing storage capacity which may be filled only in a relatively small proportion of the years. Incidental to this question is the use of the stored water. Irrigation is provided for two reasons, and one or both may be operative. The first reason is that no crops can be grown in any year, or in a certain proportion of years without it, i.e. irrigation is an absolute necessity for part of the time. The second reason is that more valuable crops can be grown any year with than without it. The first is preventive irrigation, the second is productive. Manifestly, when a thing is a necessity we can go to greater lengths to secure it than when it is a luxury, or at least, we should feel justified in spending more money or taking a longer chance. It will not ordinarily pay to develop storage which can only be filled in one year out of twenty, it will seldom pay to anticipate the one year in forty, and it may be safely said that under no circumstances should we be justified in looking ahead much more than one year in sixty. Similarly in calculating the storage which may be reasonably counted on we might ordinarily neglect the low water years which occur only once in twenty, generally the one in forty, and almost certainly the one in sixty.

So far the discussion has proceeded on the tacit understanding that the life of the reservoir is practically infinite. In theory every reservoir constructed on a silt bearing stream is due for extinction sooner or later, by filling up with silt, unless special measures are taken to combat it. This may be so far in the future that economically its life may be considered infinite. But this is by no means always the case. There is one example in New Mexico, in which 61% of the whole capacity has been filled up in 12½ years. Another, in Spain, built in 1875, is now silted full and has been for many years. Evidently such storage must be exceedingly cheap or it cannot be an economical development. In some cases it is possible to prevent this silting up by spending enough money on prevention measures. At Assouan the problem was solved by building what is to all intents and purposes a moveable dam and allowing the heavily silted flood waters to pass practically unchecked, while storing only the lighter laden or relatively clear waters of the falling flood. In other cases dredging may be an economical solution. But whatever solution can be adopted it can only be had at a price and the storage may or may not be worth it.

Cross Drainage Works

Every irrigation canal, in the upper reaches at any rate, crosses the country drainage. This drainage must be taken care of either by taking it into the canal or by passing it across. It is not always either possible or wise to take it into the canal, and in any event, the discharge which may be expected in any drainage channel is a matter of some consequence. The unknown element in the discharge to be provided for. If we guess too low the smash-up comes early in the game. It can never be known if the capacity is just right, and a margin of safety is a comfortable thing to have in reserve. But if we guess too high there it is an unnecessary expenditure. There have been some startling illustrations of extraordinary discharges from insignificant streams, and yet the number of such cases compared with the number of drainage crossings is almost zero. Probably the most instructive example of such a discharge is the Kali Nadi flood of 1885 in the Lower Ganges Canal in India. The river in normal times is a small stream of insignificant proportions. It has a catchment area of 2377 sq. miles, but, ordinarily its bed and banks are cultivated. In 1884 a flood of 50,000 sec. ft. occurred and did some damage to the canal crossing, which had been designed for only one quarter that amount. While the old crossing was being repaired designs were made for a new structure to pass 60,000 which it was expected would be sufficient. In 1885, before the new structure was commenced, a flood of 133,000 sec. ft. occurred and completely obliterated the aqueduct and every bridge but one on the stream for 150 miles. Even the natives, who are taught by tradition to keep their villages well above danger, were no better off, as many villages were swept away. It might be noted here that the name of the stream should have been something of a warning—"Kali Nadi" means—"River of the Goddess of Destruction".

This particular case has value in shewing that local indications of flood discharges are not always reliable. Just below the crossing there was a road bridge, much more than 100 years old. Flood marks above and below this bridge were quite plain and from these and the dimensions of the bridge it was calculated that a flood of 8,500 sec. ft. was possible. The crossing was made a little larger than this, having a capacity of about 12,000. After the

big flood subsided it was found that this old highway bridge was the only structure intact in 150 miles of the river. It had merely been submerged and was hardly damaged at all.

In very few cases have these drainage channels been under observation for any great length of time, if at all. Their catchment area can usually be determined with fair accuracy and its character can be ascertained by inspection or survey. None of the formulae for flood discharge are much use, as they all contain a coefficient and most of them ignore the rainfall. The precipitation record of the catchment area, or, if not available, on a neighbouring one of the same character, is the best guide. If this record is long enough and detailed enough it is possible to calculate curves of probability for a wide range in duration and intensities. The direction of travel of cyclonic storms is almost a constant for any locality, and from the curve of probable intensities, a similar curve of probable run-off at the site can be derived. The question is complicated by climatic conditions, specially in this country where snowfall is a principal factor in the discharge of such channels. In any event we should try to establish by past history, a frequency curve for flood discharges of any selected magnitudes. Having done this it is possible to calculate the justifiable expenditure now, to avoid complete disaster at any future time. For simplicity let it be assumed that the cost of a certain cross drainage work is direct straight line function of its capacity and for further simplicity assume that each cubic foot per second will cost $100.00. It will also be assumed that our analysis of the probabilities has shewn that a flood of 100 sec. ft. may be exceeded in nine years out of ten, and that for other floods the frequencies are:—

200 sec. ft.	Frequency	.60
250 " "	"	.42
300 " "	"	.24
350 " "	"	.11
400 " "	"	.03
450 " "	"	.014
500 " "	"	.003

If money costs 6% what is the justifiable expenditure? The costs will be for:—

100 sec. ft.	$10,000.00
200 " "	20,000.00
250 " "	25,000.00
300 " "	30,000.00
350 " "	35,000.00
400 " "	40,000.00
500 " "	50,000.00

As long as the structure lasts we must pay interest and when it is destroyed we should have a sum of money ready to replace it. At 400 sec. ft. its expectation of life is thirty-three years, cost $40,000.00, the annual interest would be $2,400.00 and the annual charge to sinking fund would be $240.00, total $2,640.00. On a 350 sec. ft. basis the expectancy is nine years cost $35,000.00, interest $2,100.00, sinking fund $3,045.00 total $5,145.00. For 450 feet the total annual charge is practically $2,700 and for 500 sec. ft. about $3,000, so that in such a case it would pay to build for a flood of about 400 sec. ft. although such a flood might be expected to occur not oftener, on the average, than once in every 33 years.

The Value of Permanence

Absolute permanence is not a possibility, even the eternal hills decay. What is usually meant by permanence is a useful life so long that the annual charge to replacement account is practically zero. Even this kind of permanence is not always economical, for it may cost more than it is worth. There is for each individual case a useful life which in the long run is the most economical. The annual charge for maintenance and operation may be divided into two parts. One part is the cost due to progressive deterioration in the structural integrity of the work, the other is a more or less constant charge due to conditions of service or ordinary wear and tear. The first part is practically zero with a new structure but rapidly increases in an increasing ratio as the structure gets older. Sooner or later this charge is equal to the interest on the cost of a new structure and at that time other things being equal it would be economical to rebuild. There is also a depreciation charge which is the cost of the new structure spread over the useful life of the old.

For example let us assume that a certain work has been designed and it is estimated that for a structure of type "A" the cost would be $1,000.00 and the useful life fifteen years. For type "B" the figures are $1,200.00 and thirty years, and for type "C" $1,500.00 and 50 years. The cost of operation would not vary materially for the three types. It will be further assumed that the original money is raised by the sale of stock bearing 6% and that new money will cost the same rate.

The annual charges for these types would be about as follows:—

	Type "A"	Type "B"	Type "C"
Cost	$1,000.00	1,200.00	1,500.00
Life	15 years	30 years	50 years
Interest	$60.00	72.00	90.00
Depreciation	41.70	13.00	4.50
Amortization	43.00	15.60	4.50
Av. Maintenance	30.00	36.00	45.00
Av. Annual cost	$174.70	136.60	143.00

It has been assumed that amortization and depreciation investments will bring the same rate of interest as the original money, which is not by any means always the case. As they stand, however, the figures shew that even a relatively high degree of permanence may cost more than it is worth and that a moderate degree may be better than either too much or too little.

The Cost of Operation.

It is frequently possible by refinements in design to save a considerable annual amount in the costs of operation As an extreme case we might take a system where all the distribution is by means of closed channels. In such a case, provided the pipes could stand the pressure there would be very little cost properly chargeable to the delivery of water, as each user would open and close his own outlet at his own convenience. Such a happy state is of course seldom a practicable one; but we can conceive of various intermediate conditions which might be practicable, if they could be got economically. The question thus arises of how much is justifiable to spend in capital to save operating costs.

If we assume that the capital is raised on thirty year bonds at six per cent selling at par, the annual cost to the owners of the system for the money alone will be the interest plus the sinking fund which will work out at 7.3%. It is not probable that the bonds would sell at par but at a discount, and we will assume for ease in calculating that the actual cost of the money is 8%. If a certain annual expenditure in operation and maintenance can be saved by spending a little more capital, or, which comes to the same thing, an equal annual revenue can be obtained, are we justified in spending it? Our additional capital expenditure must earn (or save) sufficient money annually to do two things, pay the interest and the sinking fund. On the assumed conditions we might spend $11.26 for every dollar we expected to earn or save, and at the end of the period be clear of debt. If the period were in perpetuity we could spend $12.50 while it it were ten years the amount would be $6.71, similarly at 3% the amounts are $19.60, $33.33 and $8.53.

This paper is intended to shew that good design involves considerations additional to those of stresses and hydraulic coefficients that the best design is not of necessity the cheapest in first cost or operation, and that the designs are as much dependent on the financial foundation as the structural.

Maryland Street Bridge, Winnipeg

Discussion of design as affected by local conditions and aesthetic considerations. Description of two-arch concrete bridge, with details of concrete tests, etc.

J. F. Greene, M.E.I.C.

Paper read before Winnipeg Branch, The Engineering Institute of Canada, January 5th, 1922

The Maryland Street bridge is a reinforced concrete arch structure provided to carry traffic across the Assiniboine river between the business section and the best residential section of the City of Winnipeg. The deck consists of a roadway 50 feet wide and two side-walks each 7 feet wide, provides for four lines of vehicular traffic including street cars, with a maximum grade of 2%.

While the structure, as a type of the standard barrel arch class of concrete bridge is not an object of special interest, the proportioning of the parts of this particular bridge to form a harmonious whole, and the mental processes involved in the proportioning may be of interest to men engaged in the solution of similar problems.

The determination of the number of spans was not left to the designers. While comparative estimates disclosed the fact that a three span bridge was slightly cheaper than a two span structure and while aesthetic precedent would demand three spans rather than two, the Department of Public Works objected to the location of the South pier in the navigation channel and intimated that only a two span bridge would be acceptable.

The elevation of the crown of the South span was fixed as a result of the clearance set by the government for navigation purposes; hence the curves for the arches had been approximately pre-determined; enough to enable one to make preliminary sketches to ascertain how to treat most effectively, the abutments, piers, spandrel walls and approaches.

Architectural Limitations of Concrete

A slight digression upon the architectural limitations of concrete as applied to bridges, may not be amiss. A concrete bridge presents all exposed faces of one colour, a dull monotonous grey. These faces in turn, disclose various irregularities, due to the method of constructing concrete structures; each lift, or day's run of concrete is distinctly outlined in any exposed concrete surface; board marks have distinctive entities of different shades of grey, some dark, some light, due probably to the absorptive capacities of the several boards, any yielding of forms, no matter how slight, results in offsets or waves; occasionally rock pockets appear which must be covered by disappointing patches. All such appearances are irregularities, and are displeasing to the eye. It is incumbent upon the designer so to proportion the major members of the structure as to make it pleasing and dignified, while at the same time so to accentuate the minor members by the use of pilasters, inserts and grooves as to withdraw the attention from the essential defects of concrete surfaces.

Fig. 1 Photograph taken June 11th 1921, falsework and forming for arch for East half of bridge, showing method for forming arch. Note old steel bridge in position just to West.

Design as affected by Appearance

Returning now to the point at which we digressed. It has been assumed as axiomatic that the dimensions and proportions of the several parts should be indicative

of the service which each part contributes to the stability of the whole. The abutments, marking clearly the river banks and the limits of the arch spans, should appear to the observer as of sufficient mass to successfull withstand the horizontal thrust from the adjacent arch spans. The pier, while of sufficient mass to carry the vertical loads transmitted from the arches, should present faces so proportioned as to offer the least obstruction to the passage of ice and water.

With these limitations and axioms in mind, preliminary sketches were made. In one sketch an excessive use of horizontal lines, and in another an equally excessive use of vertical lines, disclosed the basis of the proper treatment for this structure. The structure outlined appeared to be squatty, this quality being exaggerated by the excessive use of horizontal lines and relieved greatly by the appearance of vertical lines. Proceeding from the assumption that the structure lacked depth, abutments and piers were increased in height to a level above that of the handrails; the surfaces were broken with deep vertical grooves, and even the form boards were placed vertically to further the illusion of depth. The spandrel wall surfaces were broken up by pilasters which in turn were exaggerated by inserts at both edges to accentuate vertical shadow lines, contributing thereby to the depth illusion.

To conceal the results of yielding forms and the outline of each day's run, grooves were left in the concrete at regular intervals, both in the arches and in the walls; with each day's run ending in a groove, the line of the joint was concealed; and in addition the grooves themselves gave shadow lines which tended to relieve the monotony of the large flat grey surfaces.

In proportioning the exposed portions of the sidewalk slabs and brackets it was expedient to exceed the structural requirements of the design, lest the parts should appear too light for stability. By breaking the sloping side faces of brackets into several vertical faces, an illusion of breadth and strength was produced and the impression which would have resulted from the monotonous succession of plain brackets altered to a definite and pleasing one.

This completes the consideration of the proportioning of these parts of the structure, which should appear to observers standing either upstream or downstream from the bridge. The treatment of the deck of the bridge presented a separate and a different problem. Smooth, easy approaches from connecting streets with the least possible grades attainable were desiderata. The elimination, or failing this, the subordination of all trolley and light poles on the deck of the bridge, was adopted as a policy which should be pressed consistently.

The design of the handrail, the outstanding portion of the structure visible from the deck, remains. Since the observer views the handrail, not from a distance, as he views the arches, piers, and abutments, but at close range, the appeal to the imagination lies not so much in the tout ensemble, the grouping of the parts into a well balanced whole, as in the excellence of the parts themselves the intricacy of the fabric and the quality of the texture. Hence it is essential that special methods of handling the concrete should be adopted so that the surface irregularities of commercial concrete, such as air holes, water holes, and form marks, shall be eliminated. This may be accomplished in various ways, either by the dry process, or with sand moulds, or by scrubbing the surface of green concrete with steel brushes to expose a specially prepared coloured aggregate. On the Maryland Bridge the third method was adopted; the coloured aggregate consisting of red granite, crushed to pass a ¾ inch screen, was exposed by scrubbing with steel brushes and cleaned by several washings of muriatic acid and water.

The illumination has been provided through the medium of four-light clusters, set on combination light and trolley poles, standing in the devil strip and located about 90 feet apart. Each light is diffused by wide angle Holophane refractors which reduce materially the glare; and the lights have been set high enough on the poles to eliminate dangerous shadows from passing cars.

This is a brief and somewhat obvious resumé of the principles and methods involved in the asthetic phase of the design of the Maryland Bridge.

Structural Features

A consideration of the structural features may now be in order. The adoption of a solid barrel, earth filled arch, rather than an open spandrel reinforced concrete deck bridge, rested primarily upon economic grounds and secondarily upon structural considerations. With an average fill of ten feet, the earth fill arch showed a saving of 25% under an open spandrel arch; on the approaches the saving was greater, since the increase in the cost of the deck was not offset by a reduction in the substructure cost due to reduced dead loads. Further, the earth fill type, exposed only at the intrados, is less subject to movement and cracking due to extreme temperature changes than the open spandrel. In addition the solid barrel type offered greater mass and at the same time less obstruction to the passage of ice.

In the design of the approach retaining walls, a radical departure from standard practice was made in that the foundations for these walls were carried down through more than 20 feet of excavation, and bonded into the rock.

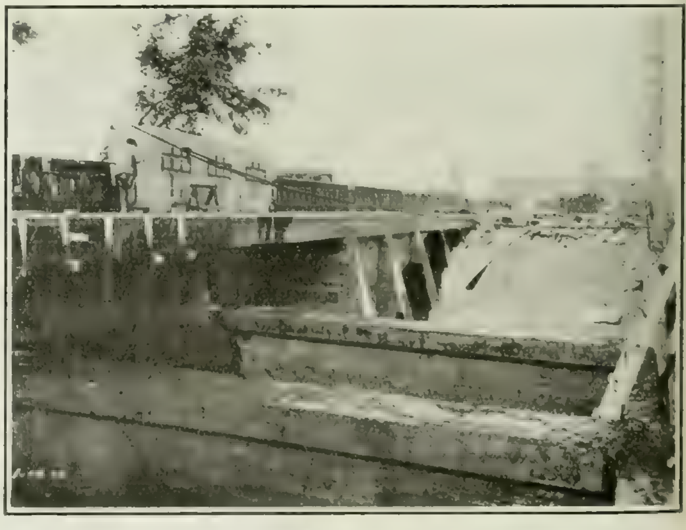

Fig. 2 Construction of West half of bridge before fill placed, sidewalk spandrel walls and counterforts on left, tiewalls between approach walls at bottom.

This exceptional treatment was due to exceptional conditions at the site. Just East of the North end of the bridge, the Cornish Baths had given evidences of a strong tendency to move toward the river, and a few hundred feet West of the bridge, several apartment blocks had actually moved and tilted; one section of one of these blocks had been condemned and demolished. The evidence was clear that the bank was not stable and that structures resting on this bank would be equally unstable; hence the reason for the unusual foundations for these approach walls.

Each arch was designed for a maximum live load of four 50 ton cars with an additional impact allowance of 20%. The arches have been so proportioned that under all conditions of loading the line of resistance lies within the middle third, resulting in a maximum compression of 453 pounds per square inch. The maximum for combined live load, dead load, rib shortening, and a temperature drop of 40 degrees is 682 pounds per square inch; and for a temperature drop of 60 degrees, the maximum combined stress is 750 pounds per square inch. For tensile stresses due to rib shortening and temperature, steel reinforcement has been provided.

The structure rests upon solid rock foundations. The abutments were designed with the line of resistance within the middle third and with a maximum pressure upon the rock of 9¼ tons per square foot. The rock was excavated to a depth of 6 feet to provide additional resistance to sliding. The maximum bearing pressure from the pier upon the rock is 11 tons.

The spandrel walls were designed as cantilevers resting upon the arches, the moment from the side-walk brackets being transmitted through counterforts to the arch ribs. Expansion joints at the haunches provide for lateral movement resulting from the fall of the arches due to a drop in temperature, and at the third points expansion joints predetermine the cracks resulting from the rise of the arches due to a rise in temperature. All joints have been projected to the handrails and appear to be working satisfactorily; those at the junctions of the handrails with the piers and abutments have opened approximately ¾″ at this writing. All joints in the walls and side-walks have been sealed by folded strips of sheet lead to prevent the escape of water through the joints with the attendant discoloration of the concrete.

Concrete Proportioning

The proportioning of the concrete itself remains for consideration. The engineering department had been instructed to use the gravel and rock provided by the Greater Winnipeg Water District at a price of $3.85 per yard for gravel supplied during the winter, $3.00 per yard for gravel furnished during the summer, and $4.00 per yard for crushed rock. The problem, stated simply, was to determine the economical proportions of cement, sand, rock and water, combined to form concrete which would give an assured conpressive stress of 2250 pounds at 28 days, i.e. three times the maximum stress in the arches. Preliminary investigations disclosed the fact that there were wide variations in the physical characteristics of different samples of gravel from the same pit. Tests of the gravel showed that the weights per cubic foot varied from 98 to 115 pounds, and the percentage of coarse retained on a ¼″ screen varied from 21% to 45%. Two series of tests

Fig. 3 Method of construction of West half of bridge, East half already opened for traffic. Method of forming sidewalk slab and concrete plant for pouring same clearly shown.

were carried out, each embracing the making, and breaking in the testing machine of 60 cylinders 6″ in diameter and 12″ long. In the first series, a lighter coarser gravel, weighing approximately 100 pounds per cubic foot was used: the materials were combined in one group to make one part of cement to six parts of the aggregate such as 1 - 1½ - 4½, 1- 2 - 4, 1 -3 - 3, 1 - 3½ - 2½ and 1 - 4 - 2: and in another group to make 1 to 7½ such as 1 - 2 - 5½, 1 - 2½ - 5, 1 - 3 - 4½, 1 - 3½ - 4.

In the second series while similar proportions were used, the gravel itself was more dense, weighing approximately 114 pounds per cubic foot. While no mechanical slump test for consistency was employed, the amount of water used was the smallest consistent with proper workability. The percentages of water for the first series varied from 6 to 8 by weight of the cement and aggregate and the water cement ratio from 0.58 to 0.86 by volume; for the second series the percentage of water varied from 7% to 9%, and the water cement ratio from .76 to 1.05.

Concrete Tests

Compression tests at 28 days showed that cylinders of the first series were approximately 22% stronger than cylinders of the second series composed of the same proportions by volume. Since prudence would dictate that we should base our decision upon the tests of the weaker of the two series, we concluded that the most economical combination from which we might expect to get concrete of the desired compressive strength was 1 part of cement to 3 of gravel to 2½ of crushed rock; while the best results for the foundation concrete containing five sacks of cement to the yard were obtained with a combination of 1 of cement to 4 of gravel to 2 of rock. Complete records of the properties of the ingredients and of the concrete, were prepared and filed for reference.

In order to obtain assurance that the concrete in the structure was of the quality anticipated as a result of the tests, sample cylinders made of the concrete actually placed, were taken daily and tested at 28 days. The concrete placed in the substructure, containing 5 sacks of cement per yard, was very dry, of a consistency such that it would just quake under tramping. The average of the tests run during the months of February, March and April for this class of concrete was 2100 pounds per square inch at 28 days. The concrete in the approach walls, containing six sacks of cement per yard, was wetter than the foundation concrete, but with only enough water to permit of spading and consolidating the mass in the thin walls. The average of the tests for this class of concrete placed during May and June was 2300 pounds per square inch. The concrete in the arches containing six sacks of cement per yard was of a consistency such that it would not flow, while at the same time containing sufficient water so that it would quake upon being worked up. The average of the tests for the concrete in the arches at 28 days was approximately 2800 pounds per square inch. The importance of keeping the water content of the concrete at a minimum consistent with workability was emphasized and impressed upon the construction organization, with the result that we were able to obtain a result which more than equalled our anticipations. The increase in strength from 2300 to 2800 pounds per square inch for concrete with the same combinations of solids but of different consistencies, is significant.

The proportioning of the handrail was the result of cut and trial methods, sample slabs having been prepared of different combinations of the aggregates; these samples, after having been scrubbed and washed, were placed side by side and compared. The proportion adopted was 1 cement - 2½ broken red granite - 1 granite dust - 1½ torpedo sand.

The construction methods adopted for this work involved no spectacular operations. The prescribed task was the construction of the new bridge with a minimum of interference with the dense traffic over the steel bridge, the centre line of which was West of the new bridge, with the floors of the old and new bridges overlapping.

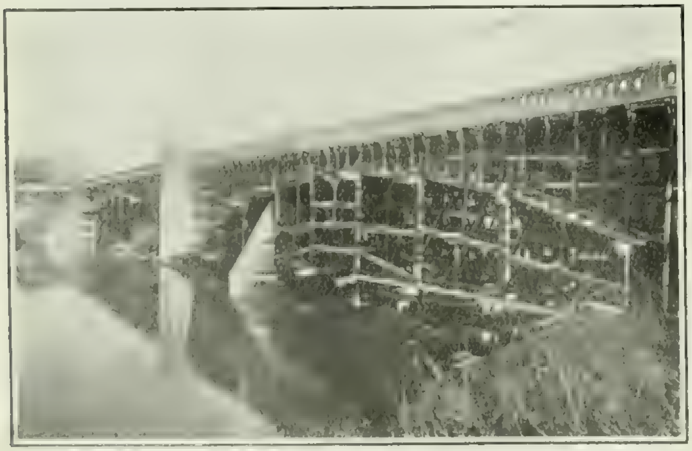

Fig. 4 West half of bridge nearing completion. Falsework and supports under sidewalk forms still in place. Handrail placed, and workmen engaged cleaning and scrubbing same.

The substructure of the abutments and pier were constructed as units; the superstructure, including arches, walls, side-walks, and fill, was constructed in two parts, the East half of the bridge having been completed and thrown open for traffic before the wrecking of the steel bridge, and the commencement of construction upon the West half. This plan was adopted on the ground of economy, and because operations might be conducted under this method with the least interference with traffic.

Progress of Work

The excavation of the abutments begun in December, was carried out with the usual derrick and skip or bucket equipment and was expensive owing to the seasonal cold. In preparing the foundations for the pier, an orange peel was used to remove a surface layer of rocks and boulders; a line of Wakefield sheet piling was driven from leads suspended from a derrick boom; this piling was backed by a puddle, the combination affording an adequate water-seal whereby the water was kept down within the dam with a single centrifugal pump. In excavations for the abutments and approach walls, sufficient water was encountered to necessitate the continuous operation of pumps.

The concrete plant for the foundations included a paving mixer with a side loading hopper for which extension leads had been prepared. In concreting the pier, this mixer was placed on cribbing at an elevation high enough to permit of dumping direct from the mixer to the pier; the cement, gravel and rock, placed in the loading hopper with wheel barrows at ground level, were elevated to the mixer over the extension leads. In concreting the abutments, the mixer was placed on the ground near the edge of the excavation, the aggregate placed in the side loader with wheel barrows, and the concrete conveyed through chutes to place.

The water and aggregate for concrete placed during the cold weather were heated: the spaces containing concrete were housed and heated for a considerable period after the placing of the concrete; every effort was made to give the concrete the advantage of being cured under conditions approaching normal.

The concrete plant for the superstructure consisted of a bin into which sand and rock were loaded from a bucket elevator, drawing from pits into which gravel and rock had been dumped, from heavy automobile trucks. This plant was so located in the West half of the North approach that it was possible to complete all concrete work without interference from the plant.

The concrete dumped from the mixer into side dump cars was drawn to place over a light wooden trestle by a small gasoline dinky, the engine for which had been taken from the mixer. In placing the concrete for the side-walk and spandrel walls, concrete buggies were drawn to place by the dinky on flat cars made in part of the trucks from the side dump cars. The plant was cheap, eminently satisfactory, and the results were excellent.

The falsework was conventional, except perhaps, in the method employed to obtain the arch curve. In place of the standard practice of cutting the curves from the stringers, wedges and waste blocks and planks were added

to build up the curves on plain stringers. Under this method much lumber otherwise worthless was used, and the stringers of new stock were available after use in a condition as good as that of new lumber.

Cinders for the fill were accumulated in an adjacent vacant lot during the first half of the year. These cinders were loaded into dump carts with a light electric Thew shovel and hauled to place on the bridge.

Construction began in December 1920; the East half of the bridge was thrown open for traffic in August; the West half in November; and the street car traffic commenced on December 1st 1921.

The contract for the construction was awarded to the city engineer, W. P. Brereton, M.E.I.C., on a competitive basis, at a price of $250,000.00, and the bridge has been completed well within the contract price. The project was carried out with A. L. Cavanagh, A.M.E.I.C., as superintendent; Allan Cotman, chief draftsman, and J. F. Greene, M.E.I.C., as consulting engineer.

Professional Meetings 1922

Vancouver: June sixteenth and seventeenth.
Winnipeg: September fifth, sixth and seventh.

British Columbia Professional Meeting.

It has been the desire of members of *The Institute* resident in British Columbia for several years, to hold a professional meeting in their Province. Last year there was a tacit understanding, at the Professional Meeting in Saskatoon, that during the coming summer, support would be given by the Prairie Provinces to such a meeting in Vancouver or Victoria. While the General Professional Meeting in Winnipeg would make two meetings west of the Lakes within a few months, it is still felt that a meeting at the Coast would not interfere with the Winnipeg meeting, and be sufficiently supported to insure a representative gathering.

The approval of the Council of *The Institute* was given, at the March meeting, to a professional meeting of *The Institute* in Vancouver, to be held on June sixteenth and seventeenth. The proposal to hold the meeting in Vancouver was endorsed by the Victoria, Saskatchewan, Calgary, Edmonton, Lethbridge and Winnipeg Branches. In June Vancouver is seen at its best. The progressiveness of the B.C. members is well known, and it goes without question that the meeting approved will be a complete success.

Code of Ethics

Engineering ethics came up for discussion at the last meeting of Council, the question being raised by a councillor as to whether the present Code of Ethics affected non-corporate members. Although the question of changing or enlarging the Code of Ethics of *The Institute* is now before the Committee on Policy, it was decided by Council to delete the word "Corporate" from the present Code of Ethics, as appearing on page twenty-three of the Charter, By-laws, List of Members, the word "Member" following, in each case to appear without a capital, the interpretation being that the Code should apply to all grades.

Committee on Policy Meeting.

A plenary meeting of the Committee on Policy of *The Institute* will be held at Headquarters on Tuesday April eleventh, at ten o'clock a.m., and will continue in session until the various proposals which have been discussed by this Committee for nearly two years, can be brought to definite conclusions and recommendations to Council. This body is one of the most important of *The Institute*, since the Committee on Society Affairs, and its deliberations will doubtless influence *The Institute's* future to a considerable extent. The personnel of the Committee is such as to ensure a report embodying constructive suggestions based on good judgment.

With the addition of Councillors Duchastel and Thornton and H. H. Vaughan, Past President, the Committee on Policy is now constituted:—J. B. Challies, Chairman, A. B. Lambe, Secretary, A. R. Decary, Brig.-Gen. C. H. Mitchell, Walter J. Francis, K. H. Smith, J. G. Sullivan, A. E. Foreman, C. C. Kirby, A. B. Normandin, W. P. Wilgar, R. O. Wynne-Roberts, Wills Maclachlan, W. G. Swan, F. Peters, A. J. McPherson, J. A. Duchastel, K. B. Thornton, H. H. Vaughan.

C.I.M.M. Changes Policy

At the Annual Meeting of the Canadian Institute of Mining and Metallurgy held at Ottawa, on March first, second, and third, a complete discussion took place on the changes of policy proposed by Secretary-Treasurer George C. Mackenzie, resulting in their adoption, which will class this meeting as one of the most historic and important in the annals of C.I.M.M. meetings.

In his discussion on the proposals Mr. Mackenzie pointed out that to his mind, the Institute must adopt one of three definite policies. The first, to "proceed as at present, plodding along with uncertain gait and without a definite objective, quite content to exist as an organization which cannot be classed either as a professional or as an industrial society — a mixture of both, and without any well defined characteristics of either, which would entail a simple and placid existance for the future". The second would be to define the functions of the Institute as a technical organization, with certain prescribed and rigid requirements regarding membership, including adopting a code of ethics, and giving a definite professional standing to professional members. This, he believed, would cause the loss of support of the non-technical members, and require increasing the dues to twenty-five dollars, at least, per annum. The third proposal was the adoption of an industrial policy as already outlined by him.

Following the discussion a resolution and amendment were presented, both favouring Mr. Mackenzie's proposals. The resolution was unanimously passed.

> That this Annual Meeting go on record as approving the general principles of Policy as outlined in Mr. Mackenzie's address, and would urge upon Council the advisability of immediately supporting Mr. Mackenzie by such action as Council deems possible.

Since his appointment as Secretary-Treasurer Mr. Mackenzie has visited every mining district in Canada, with a view to finding out the general feeling towards the future of the Institute. As a result of his study of conditions, and having in view a solution of the problems facing the Institute, Mr. Mackenzie presented a report on "Institute Policy" published in the January "Bulletin". While the whole report is interesting, it is possible to publish merely extracts bearing upon the definite suggested policy. Mr. Mackenzie states:—

There is a strong under-current of feeling within the Institute that it is not functioning along the lines laid down in its charter. The charter provided us with a definite plan, but we are not following that plan, nor are we taking any steps to build an organization that will enable us to put that plan into effective operation. To be specific, many of our members consider that the Institute has developed into a pseudomorphic form, in which traces of the original structure are yet discernible, but which, to the uninitiated, resembles nothing more than a professional organization existing for the sole benefit of a particular class; and that, in consequence of this change, the Institute has been neglectful of its opportunities for growth and prestige in the service of industry.

The Charter of the Institute, adopted in eighteen hundred and ninety-eight, provided the following definite plan as a chart for the future guidance of the Society:

(1) To promote the arts and sciences connected with the economical production of valuable minerals and metals, by means of meetings for the reading and discussion of technical papers, and the subsequent distribution of such information as may be gained through the medium of publications.

(2) The establishment of a central reference library and a headquarters for the purpose of this organization.

(3) To take concerted action upon such matters as affect the mining and metallurgical industries of the Dominion of Canada.

(4) To encourage and promote these industries by all lawful and honourable means.

Note particularly that the Institute was organized for the purpose of representing and encouraging industry. There is no mention of assistance or protection for the individual, nor is there any comment upon the ethics of the profession of engineering. The individual and the profession are submerged in the hypothesis that if industry be served and fostered, the servants of industry will share in the benefits that must surely follow. A clear understanding of the foregoing, and acceptance of the fundamental that the Institute exists first and foremost for industry and is representative of industry, is necessary, because, if we follow this premise to its logical conclusion, we cannot decide otherwise than that the rights of the individual are secondary to the welfare of the industry. If this is granted, and it is difficult to deny in the face of the Charter, it may be possible to adopt a policy which, followed with persistence, should place the Institute in a stronger position than at any time in its history.

* * * * * * * * * * * * * * *

There is, therefore, an important question of policy to be settled, and it must be studied from two standpoints:

(1) From the standpoint of the relationship between the Institute and the industry;

(2) From the standpoint of financing the Institute.

If we should decide to restrict membership in the Institute, following the lines adopted by our immediate predecessors and admitting to full membership only those persons possessing certain qualifications, then the Institute will develop slowly along pseudomorphic lines as formerly. If limited membership is desired and decided upon, it may be necessary to either give up the programme entered upon last year, or to increase the annual dues in amount sufficient to provide the necessary funds for that purpose. It should also be recognized that with a limited membership of professional or qualified men, the Institute will not possess the strength of a business organization necessary for influencing public opinion, and, as a consequence, neither the public nor the Government will be inclined to give serious attention to such a comparatively small group of men, whose society would be regarded as professional and existing for the benefit of a certain class of individuals rather than for the advancement of industry.

An alternative policy would be to follow to their logical conclusion the ideals expressed in the Charter: to develop the Institute along the lines of a powerful industrial society, whose first consideration would be the betterment of the industries of mining and metallurgy. If this policy be followed, then the doors of the Institute should be open to all who wish to become full members in a truly national organization.

* * * * * * * * * * * * * * * * * * * *

The broadening of the Institute policy on industrial lines may or may not require amendments to existing By-Laws. Should the Institute place itself on record in approval of a broad interpretation of the existing By-Laws governing membership, it is possible that succeeding Councils may follow the precedent thus established. I am inclined, however, to suggest that, if the Institute is convinced that a broad industrial policy is in the best interests of the Society, proper steps be taken to amend the By-Laws so that its industrial functions shall stand out very clearly.

Qualification for membership does not imply professional attainment, but rather conformity with the purpose of the Institute. Neither is full membership, or special classification of certain individuals, emblematic of the spirit of the Institute. One cannot do otherwise than agree with this view if the fundamental is accepted that the Institute was born in the interests of industry; and, granting that premise, the only logical conclusion one can arrive at is that qualification for membership must be of secondary importance to the service which the Institute is expected to render.

In case the purpose of this article should be misunderstood, I desire to say that I am not in favour of any quick change. I believe that a broad industrial policy should be shaped slowly and with deliberation. For the present, it is suggested that your Council interpret broadly the existing By-Laws governing membership, and that every opportunity be given candidates to enter the full membership class by eliminating the line of division between associate and full members. Does not the professional-member class afford sufficient distinctive tone to the Institute? I wish to emphasize again the fact that, if

the Institute is to expand logically along industrial lines, we must secure many more members from amongst the business men who have invested their money or are directing the investments of others, prospectors, salaried employees, and public spirited citizens — and, in fact, take in all reputable persons who wish to identify themselves with us. It is believed that a large number of new members could be secured if the Institute would accept them as full members and thus place all on the same footing.

* * * * * * * * * * * * * * * * * *

The Institute, in the performance of its function as a servant of industry, should strive for:

(1) Safety and efficiency in all mining and metallurgical operations.

(2) Intelligent conservation of mineral resources, together with the education of the public with the view of obtaining the highest development of these resources; thus stimulating investment by showing that legitimate mining is a profitable business.

(3) Sympathetic relations with the Federal and Provincial Governments for the improvement of mining legislation.

(4) Intelligent administration of such Federal and Provincial Mines Departments which deal with the industries of mining and metallurgy.

(5) Co-operation along all lines which lead to better conditions in the industries we represent, for improvements in production, treatment, transportation and exchange.

If our membership can be increased to the not impossible figure of five thousand, I would propose the adoption of a divisional system representative of provincial territories.

* * * * * * * * * * * * * * * * * *

How can this Institute, as it is organized at present, bring sufficient and convincing pressure upon the Federal Government to effect the adoption of an enlightened policy with regard to the Department of Mines at Ottawa?

* * * * * * * * * * * * * * * * * *

How can this Institute accomplish anything of tangible value to the industry garbed as it is with a coat and trousers of academic cut and a modest white waistcoat of professional tone? What we require is the adoption of an aggressive policy that will attract all classes of the mining public to our ranks, and we must put on a business suit of the cut and style which the public will recognize and understand.

* * * * * * * * * * * * * * * * * *

With the adoption of such a policy it is fondly hoped that those who have, in the past, been responsible for creating and tending to perpetuate feelings and sentiments calculated to keep the Canadian Institute of Mining and Metallurgy and *The Engineering Institute of Canada* apart, rather than as they should be doing, acting in the closest harmony, will realize that there can now be no conflict of interests, but that a spirit of mutual confidence, assistance, and co-operation should prevail to the fullest extent. This is, undoubtedly, the feeling of the membership of *The Engineering Institute of Canada* as to our relations with the Canadian Institute of Mining and Metallurgy, and it is certain that the goodwill of the members of *The Engineering Institute* will be gladly and freely given in the development of the aspirations embodied in the policy adopted at the Annual Meeting of the Canadian Institute of Mining and Metallurgy.

Presentation of Leonard Medals.

The following account of the presentation of the Leonard medals, supplied in advance by the courtesy of George C. Mackenzie, Secretary of the Canadian Institute of Mining and Metallurgy from the Proceedings of the Annual General Meeting, held on March first, second, and third, is of interest to members of *The Engineering Institute.*

"Through the courtesy of The Engineering Institute of Canada, the President was then enabled to make formal presentation of the "Leonard" medals for the years 1919, 1920, and 1921, for each of which years the Leonard Medal had been awarded to a member of the Canadian Institute of Mining and Metallurgy.

The Leonard Medal for 1919 was awarded to E. E. Campbell for his paper entitled "The Hidden Creek Mine and its Operations". An interesting feature of this medal is that it is made from pure gold obtained from the Coniagas Mine. Col. Leonard has informed us that a peculiarity of the Cobalt camp is that gold has rarely been detected in its ores, and that, as far as he is aware, the only commercial recovery of gold from Cobalt ores has been made in the electrolytic tanks at the Thorold smelter, where, in the refining of 41,000,000 ounces of silver there was recovered 25.4 ounces of gold. A medal similar in every way to that presented to Mr. Campbell has been kept by Col. Leonard as a souvenir. Mr. Campbell who is now with the United Verde Extension Mining Company, in Jerome, Arizona, was unable to be present and authorized Mr. Charles Camsell, deputy minister of mines, to receive the medal on his behalf.

The Leonard Medal for 1920 was awarded to The Staff of the International Nickel Company of Canada, Ltd., for their paper on "The Mining and Smelting Operations of the International Nickel Company of Canada, Ltd." J. C. Nicholls, the general superintendent of the company, accepted the medal on behalf of the staff, and expressed the appreciation of himself and his co-workers at having been awarded the medal.

The Leonard Medal for 1921 was awarded to John Ness, of the Imperial Oil Company, Ltd., for his paper on "The Search for Oil in the West". In making this presentation Dr. Corless said: "I remember, when sitting in the audience at the time the paper was read, saying to a neighbour that it was one of the most interesting I had ever heard. Civilization can only advance with knowledge, and Mr. Ness' paper was a most valuable contribution to our knowledge concerning the unknown resources of the great north-west." Mr. Ness accepted the medal with a few happy remarks, in the course of which he paid graceful tribute to his colleagues on the staff of the Imperial Oil Company, whose assistance, he said, had made the presentation of the paper possible."

Other Society Transactions

Following the announcement made in the January *Journal* advising our membership that arrangements had been made with the American Institute of Electrical Engineers, the American Institute of Mining and Metallurgical Engineers, the American Society of Civil Engineers and the American Society of Mechanical Engineers, whereby our members receive the Transactions of these societies at the same price as that paid by their own members, the following table can be used as a reference of the various prices, the first column indicating the amount to be paid by the members of *The Engineering Institute* for the various publications.

	Rate to Member	Non-Member Rate
American Institute of Electrical Engineers

Special Water Power Lectures at University of Toronto

In order to supplement in an effective way the courses in water power development which have been a part of the curriculum in engineering in the University of Toronto for many years, arrangements were made this session for a short series of lectures to be given by five prominent Canadian and American hydraulic engineers. The importance of developing our water powers has long been recognized and the hydraulic courses have always been shaped with this problem in view, and also with an idea of training engineers for water supply and irrigation.

After consideration it was thought best to deal with the water power development only, because sufficient time was not available without making the course much longer than was thought advisable at the present time of year.

In arranging the course, Professor R. W. Angus, M.E.I.C., head of the Department of Mechanical Engineering, under which the hydraulic work is done, invited five very prominent men who have become recognized authorities in a special field of the work, each of whom dealt with a different phase of it, so that in a brief way the whole problem of water power development was viewed from different angles and each detail received consideration.

From the outset the course was designed to be of particular value to advanced students and to practising engineers, so that the lectures were technical, rather than descriptive, and were of special interest to Fourth year men, but were also enjoyed by large numbers from the Third year as well.

Although the lectures chanced to come on the same week as the Engineering Society elections, which always take up much of the student's thought and attention, the attendance ranged from two hundred to three hundred on every occasion.

Addresses by Lewis F. Moody, Philadelphia.

The course opened with two lectures on Feb. 27th by Lewis F. Moody, a graduate of the University of Pennsylvania, and for some years professor of Hydraulics in Rensselaer Polytechnic institute, but now consulting engineer for the I. P. Morris Department of William Cramp and Sons Ship and Engine Co., Philadelphia.

Under the headings "Some of the principles controlling the use and design of hydraulic turbines" and "Hydraulic turbines and Installations", Mr. Moody presented very difficult theory of the turbine in a concise form, deriving the necessary equations and illustrating his work by slides and sketches. He also gave a large number of slides showing the very latest turbine designs and illustrating the new high speed turbine, in the development of which he has taken a prominent part. A brief summary of this lecture has been printed elsewhere.

The new forms of draft tube, mainly designed by Mr. Moody and applied to some of the largest plants in the world were fully discussed and their theory explained, although the speaker carefully concealed his connection with the inventions.

Address by Max V. Sauer, M.E.I.C.

The address by Mr. Sauer, M.E.I.C., a graduate of the University of Toronto, and hydraulic engineer of design for the Hydro-Electric Power Commission of Ontario, dealt with the general considerations affecting the power house design and layout and the speaker discussed various details of the plant. Starting with the selection of the turbine for a particular duty, Mr. Sauer discussed the exciters, governors, oiling systems, and other auxiliary equipment laying much stress on the factor of reliability which he regarded as more important than even the efficiency. The need of reliable oil pumps and air compressors was stressed and many practical points were mentioned.

During the discussion which followed, many other points were brought forward and the session proved profitable and interesting.

Address by T. H. Hogg, A.M.E.I.C.

The next phase of the development dealt with was the consideration of the Intake, Head Works, Power Canal or Conduit, Surge Tank and Penstock, and T.H. Hogg, A.M.E.I.C., assistant hydraulic engineer for the Hydro-Electric Power Commission of Ontario treated the matter in a most capable way. Having outlined some of the troubles due to ice, he explained the principles governing the intake design and next took up the matter of the canal itself, outlining the general method of handling the problem and giving many helpful ideas and suggestions as to how such a difficult problem could be solved, incidentally commending the methods now being taught at this University.

The problem of the surge tank took a fair share of Mr. Hogg's time, and he showed why it was needed and worked out some problems, supplemented by his experience, to show how important it is to make proper allowance for surges. All that was possible was to indicate the method of solution, both this problem and the former one being examples of the use of arithmetical integration.

Address by W. M. White.

The address by W. M. White, hydraulic engineer for the Allis Chalmers Co., Milwaukee, a graduate of Tulane University, proved a most valuable one. Mr. White had just returned to America after an extended trip in Japan, Formosa and the east, and spoke in a very interesting way of the developments in those countries in the hydraulic line, pointing out that they were realizing the very great value of water power in the progress of their nations.

Mr. White discussed primarily power house machinery showing how the draft tube affected the design and discussing the best form of the tube and the experiments that lead to his conclusions. He also discussed the modern turbine development at some length and showed how the power house could be much simplified in good design, and also gave some interesting illustrations of how the best advantage may be taken of the head and volume and described some exceedingly novel power houses. His company was the only one, he said, which had supplied the most recent form of high speed runners to actual plants.

Addresses by N. R. Gibson, M.E.I.C.

The two concluding lectures were given by N. R. Gibson, M.E.I.C., a graduate of the University of Toronto in 1902, and at present hydraulic engineer for the Niagara Falls Power Co., Niagara Falls, N.Y. Mr. Gibson has brought some distinction recently to his alma mater by two important researches, of recognized merit.

In his afternoon address Mr. Gibson dealt with the regulation and testing of turbines, and set out fully how the problem of regulation was affected by the dimensions of the pipe line and penstock and also by the changes of load. He then discussed at length the importance of efficiency determinations and the reasons why these must be made with accuracy, but at the same time he showed how difficult it was to measure some of the elements, more particularly the quantity of water flowing. Mr. Gibson's simple and precise solution of this problem is well known to engineers and is likely to be almost universally employed; his description of it, therefore, proved of much interest.

The concluding lecture on the evening of March 6th was also by Mr. Gibson, and in it he discussed the economic features of water power development, explaining the conditions where water power is preferable to steam, the meaning of rates, the effect of the "diversity factor" and many other of the very important points connected with the sale of power. He concluded his lecture by a splendid set of slides showing the progress being made by his Company with the new tunnel at Niagara Falls, and also the advances made in hydraulic machinery, as illustrated in the plant he is connected with.

Very general satisfaction has been expressed everywhere with the entire course of lectures, both by engineers and students, and the results have fully justified the effort put forth. Those who so kindly gave of their time and ability to deliver the lectures have very deservedly earned the gratitude of this University.

OBITUARY

Hon. Geo. R. Smith, M.E.I.C.

The death took place on February 20th, at Thetford Mines, Que., of the Hon. Geo. R. Smith, M.E.I.C. Mr. Smith was born at Newark, N.J., on February 17th 1860. He came to Canada in connection with the mining industry in the Ottawa region. The asbestos deposits were beginning to attract general attention and in their development he became active. He held the position of vice-president and general manager of Bell's Asbestos Company, at Thetford Mines, and was vice-president and general manager of the Asbestos Manufacturing Company of Montreal. He was one of the founders of the Canadian Mining Institute, of which he was for some time president. When he retired in 1907, the Council of the Institute presented him with a silver tea service in acknowledgement of his services. He was interested also in other commercial enterprises and was a member of the Montreal Board of Trade. He was elected a Member of *The Engineering Institute of Canada* on October 24th, 1907.

Mr. Smith sat in the Legislative Assembly for Megantic from 1897 till 1909, and took active interest in elementary educational work in the province, in 1911 he was appointed a member of the Legislative Council. He married in 1886, Isabella Frances, daughter of Mr. George L. Parker of Buckingham, and is survived by his widow, two daughters and five sons.

EMPLOYMENT BUREAU

AND

MEMBERS' EXCHANGE

To make this department more valuable it is proposed that in future advertisements of situations vacant should state salary, and give details of requiremenfs.

Situations Wanted

Civil Engineer

Fourth year Toronto student open for engagement, preferably in Toronto. Civil engineer experience with six months at the Experimental Station of the Provincial Board of Health of Ontario. Apply Box 91-P.

Transitman and Draftsman

Transitman and draftsman, S.E.I.C., desires position in field. Experienced in mining and water power surveying. Free to commence May 1st. Apply Box 92-P.

Civil Engineer

Civil engineer with six years railway experience seeks position preferably in Ontario, but will go anywhere. Apply Box 93-P.

Civil Engineer

Civil engineer, A.M.E.I.C., college graduate, 32 years old, desires to get in touch with firm specializing in reinforced concrete design and construction. Experience in water power investigation, dam and power plant construction, concrete construction and municipal engineering in Nova Scotia, Toronto, Middle West and B.C. Particulars and references on request. Apply Box 94-P.

Members' Exchange

For Sale

Report of 7th International Congress of Applied Chemistry. Report of 8th International Congress of Applied Chemistry, Volumes 1 to 27. Transactions of the Electro Chemical Society, from 1902-1914 inclusive. Apply Box 23-A.

Level for Sale.

Buff and Buff 15½" engineer's dumpy level. Complete with tripod and mahogany case. Level has clamp and tangent screw. Telescope has inverting eye piece. Apply Box 25-A.

Time Saving Charts.

A member of *The Institute* has prepared for the use of engineers, architects, contractors and others interested in reinforced concrete, charts for reinforced concrete beams and columns, which will prove valuable time savers to all having to do with reinforced concrete design in any way.

The bending moment of the beam having been found, in foot pounds, by referring to the chart, the nearest figure on the curved line corresponding to the bending moment will give the size of the beam required in inches for the depth and width, and will also show the square inches of steel required in the bottom portion of the beam. After the size is chosen, the extra reinforcement required to take any additional strains will have to be again calculated, but this is a simple matter. The number of rods required, and the size of same, will be governed by the width of the beam, and the spacing of the rods, either in square, or irregular beams, easily determined. The beam chart shows in the left hand lower corner examples of a beam to be used, the bending moment having been first calculated. Data for additional strains are also worked out.

Attached to the beam chart, is an example of a floor, with method of calculating the bending moment, and the requisite beam to support same, giving sizes required as also the area of steel. In both cases the strains in the steel and concrete are similar, proving conclusively the correctness of the calculations and the curve lines. The vertical and horizontal lines give respectively the depth and width of beam in inches, and the curved lines the bending moment in foot pounds, and the area of steel required in square inches.

(The method of placing the steel rods, their connections, and necessary stirrups, will be governed entirely by the architectural design, a fixed rule being a hard matter to give.)

The column chart shows the sizes in inches, either for square or irregular columns, required to support a given load, shown on the curved lines, also the square inches of steel for the vertical rods, the method of tying the rods together being a detail to be chosen by the designer. (These charts will be a time saver for preliminary work, and will allow any building designer to find out at once the sizes required to suit the head room, and other fixed measurements.)

The charts are available for ten dollars a set of three blue prints, and will be mailed to anyone desiring same by addressing Box 26A.

List of student members at Queen's University requiring summer employment,

The Engineering Society of Queen's University desires to announce the establishment of a permanent Employment Service. It will give employers of technically trained men complete and reliable information regarding graduates and undergraduates.

Listed below are some of the students desirous of obtaining employment in May. Almost all have expressed their willingness to do [illegible] Full information regarding any of these men may be obtained promptly from the Manager of the Engineering Society Employment Service, Kingston, Ontario.

Name	Work preferred	Experience
Civil Graduating Class		
Emery, D. J.	Reinforced concrete construction.	4½ yrs. foreman reinforced concrete construction, railroad, surveying, drafting, ass't. eng'r. G.T.R. arbitration, 4½ yrs. overseas in C.E. (M.C., M.M.).
Walker, G. S.	Highway or railway work.	4 yrs. ass't. to D.L.S.; 1 yr. N.T.R. cross section; 5 mos. instrument' man, dept. Highways; 4 yrs. overseas C.E.
Greenwood, W.	Waterpower or highway work	11 mos. geological survey; 2 yrs. overseas; 11 mos. instrument man.
Deamude, F. V.	Structural, reinforced concrete or municipal	7 mos. topographical survey; 3 mos. reinforced concrete; . mos. railway location; 5 mos. machine shop; 2 yrs. overseas.
Tully, D. J.	Reinforced concrete, structural	2 mos. plane table, irrigation surveys, 10 mos. stadia surveys.
Wallace, A. M.	Construction work, buildings or roads, office or outside work. Surveying	6 mos. foreman of labourers on concrete work.
Paoli, A. A.	Operation of electric steel furnaces or open hearth, superintending operation or construction of same	1 yr. Moreland Motor Truck Co., supervising manufacture of iron and steel; night sup't. Charleton Alloy Steel Co. for 7 mos., 2 yrs. smelting of steel.
Poyser, B. D.	Reinforced concrete	1 yr. construction of concrete bldgs.
M[illegible], H. R.	Municipal or with Consulting firm. Reinforced concrete work	Ass't. Eng'r. City of Stratford. Charge of paving, 12 mos.
III Year Civil		
Meatherell, J. N.	Construction work; highway construction; draftsman	5 mos. rodman on survey.
Currie, V. R	Reinforced concrete construction, surveying	5 mos. county road commissioner.
Swift, E. R.	Instrument work; construction	5 mos. rodman on maintenance of way; 3 yrs. overseas.
MacDonald, N. T.	Electrical work, either maintenance or construction; surveying	5 mos. in charge of rolling mills; 1 yr. electrician's helper on construction on Chippawa Canal; 5 mos. lineman.
Sutherland, N. C.	Bldg. construction; road construction; surveying	3 mos. contracting; 4 mos. investigation of iron property; 5 mos. ass't. magnetometric survey; 3 yrs. overseas.
Rousell, F.	Construction work; steel or cement highway	5 mos. concrete inspector on highways; 3 yrs. overseas.
Koen, J. D.	Surveying rodman, geological survey; provincial highway	5 mos. rodman on survey.
Robertson, D. G.	Civil engineering	5 mos. dep't. Public Highways, Ont.
Burns, R. P.	Construction work; mech'l. work; surveying	23 mos. overseas; 5 mos. rodman on survey.
Marlatt, C. E.	Construction	5 mos. assistant to flotation expert, research lab.; 5 mos. sampler in flotation mill, assistant to surveyor.
Ludgate, J. V.	Engineering work, chiefly outdoor work	5 mos. survey as rodman; 5 mos. rodman, axeman, asst. transitman.
Sutherland, N. C.	Construction, highways, or survey parties.	5 mos. assistant on investigation of iron properties; 5 mos. assistant on magnetometric survey.
IV Year Electrical		
Detlor, W. K.	Shop work.	5 mos. assembling transformers and winding transformers.
Saunders, J. B.	Shop work.	5 mos. armature winding and assembling motors; 5 mos. electrical helper, stock keeping; carried on electrical contracting business in square time from 1917 to present; wired Queen's stadium.
III Year Electrical		
Hicks, A.	Machine or electrical shop work.	
Cockburn, J. M.	Electrical work	5 mos. munition work.
Nayler, J. B.	Electrical or machine shop work.	5 mos. machine shop and garage work; 3½ yrs. overseas (M.M.).
Climo, C.	Electrical work	2 mos. asst. dyer; 2 mos. foreman in canning factory; 1 month dredging inspector; 2 yrs. overseas in heavy battery.
Affleck, W. E.	Electrical work	Several months miller and foreman in flour mills; 3 mos. subforeman on telephone plant; 3 mos. electrician's helper in power plant.
Jones, V. C.	Designing or testing motors and generators	7 mos. draftsman for a.c. motors and generators; 28 mos. overseas in C.F.A.
Baker, A. J.	Power plant work or hydro construction	2 yrs. machine shop experience and car barn work (wiring and motor repairing).
Rose, D. C.	Electrical work in industrial plant.	4 mos. drafting; some wiring.
Collyer, E.	Work in power house	6 mos. electrical work (wiring).
Bastedo, T. F.	Machine shop work	4 mos. machinist in automobile factory.
Murray, J. D.	Electrical experience	House wiring; 4 mos. time keeper; bolter up, etc., in shipbldg. co.
Bracken, W. D.	Electrical work	5 mos. hydro-electric system, inspector in the overhead pole lines in the city of Toronto.
Taggart, H. A.	Electrical work	3 mos. coil winding for electrical co.
II Year Electrical		
Appleyard, C. E.	Electrical work.	2 yrs. Royal Navy; 5 mos. steel plant.
Murphy, C. B.	Electrical work.	5 mos. foreman on bridge construction.
Cross, D. M.	Electrical work.	10 mos. general work in factory.
Tkachyk, J.	Electrical work	5 mos. chainman and topographer on preliminary and location.
Thompson, M. L.	Electrical work	11 mos. general factory routine.
McKenzie, W. M. K.	Electrical work	Three years overseas with "Princess Pats".
Currie, E. B.	Electrical work	6 mos. time keeping.
Lyons, G. S.	Electrical work	2 yrs. telephone installation and switchboard repairman.
IV Year Mechanical		
Clench, R. J.	Machine shop work	5 mos. shop work; 5 mos. shell inspector; 2 yrs. overseas, in R.F.C.
Roy, E. W.	Training along production engineering lines	3 yrs. machinist in iron works; 5 mos. asst. chief inspector in machine shop.

Name	Work preferred	Experience
Wilson, D.	Drafting or construction work	5 mos. garage work; 5 mos. geological survey; 5 mos. shop work.
Young, J. P.	Machine designing or mechanical drafting	3 yrs. machine shop; 1½ yrs. mechanical drafting office; 39 mos. overseas in C.G.A.
Bulmer, C. E.	Mechanical engineering	5 mos. machinist's apprentice.
III Year Mechanical		
Rapley, B. P.	Machine shop work	
MacKay, R.	Machine shop work	6 mos. rodman; 3 mos. office work.
Moulton, R. H.	Mechanical or electrical work	4 yrs. office work.
Aitkin, R. J.	Mechanical or electrical work	18 mos. designer and draftsman with car company; 4 mos. steel detailer on elevator construction; 2 yrs. 9 mos. machine repairs, shop work, construction work; 11 mos. mould loftsman and foreman on steel erection in shipyard; 5 mos. pulp and paper plant.
Warner, G. W.	Shop work	General knowledge of steam and internal combustion engines.
Morrison, N. A.	Mechanical work	
Minnes, V. A.	Machine shop work	2 mos. transmission dept. of automobile plant; 4 mos. motor assembly automobile plant; 6 mos. shipbuilding plant; 2 yrs. overseas.
Hipwell, J. E.	Machine shop work	9 mos. in automobile plant on motor manufacture.
Dawson, W. A.	Ass't. to mech. engineer in tool room.	5 yrs. tool and die maker on naval ordnance work and dies for intricate parts.
Lewis, W. M.	Machine shop work	7 mos. shell inspector; 5 mos. oiler and assistant engineer on lake boat; 4 yrs. school teacher; 2 yrs. on railroad construction.
Hay, N. M.	Mechanical drafting office	1 yr. automobile factory; 9 mos. G.T.R. shops; 2 yrs. garage and business experience; 3 yrs. overseas in R.F.A.
Sully, E. A.	Machine shop practice	5 mos. machine shop work in electric plant.
Kennedy, T. W.	Engine or automobile plant; drafting	5 mos. machine shop practice.
Showers, C. G.	Steam fitting	10 mos. ass't. to millwright, pipe fitter and general maintenance.
Halliday, H. J.	Machine shop work	10 mos. machinist production work.
II Year Mechanical		
McNeil, R.	Machine shop work, paper mill	5 mos. oiler and millwright's helper.
Brown, G. H.	Concrete inspection work and machine shop experience	5 mos. chainman in survey; 5 mos. construction work.
Edwards, H. J.	Machine shop practice	5 mos. labourer provincial highways; 10 mos. tire and rubber co.

List of student members of the Toronto Branch requiring summer employment.

Name	Address	Year	Dept.	Work desired	Experience	Remarks
C. H. Carslake	10 Smith St., Toronto, Ont.	Grad'g	Chem. eng.	Any industry in which engr'g. chem. etc., or engineer'g. train'g. is necessary.	4 yrs. carpentering and bldg., 6 mos. in charge of construction work	3½ yrs. overseas willing to star at bottom.
R. H. B. Cook	Box 509, Aurora, Ont.	Grad'g	Civil	Municip'l., sanitary or highway	1 sum. Tor. Harb. Com. instrument man; 1 sum. as inspt'r Prov. Board of Health.	Returned soldier; location immaterial.
F. C. Ball	168 Adelaide St., Toronto, Ont.	3	Civil	Struct'l. or highway		
S. T. Franks	2314 Scarth St., Regina, Sask.	3	Electrical	Electric'l. or other construction	5 mos. transmission line construction; 3 mos. Railways construction 6 mos. road surveys	
R. T. Lyons	10 Withrow Ave., Toronto, Ont.	3	Civil	Concrete preferably	Insp. for Ont. Public Highways.	
J. M. Smith	Durham, Ontario	3	Civil	Struct'l. or survey'g.		
P. E. Baumann	568 Crawford St., Toronto, Ont.	3	Civil	Geolog'l. or geodetic survey'g.; irrigat'n.	With Swiss Federal Railway, dept. of hydro-elec. drainage and levelling.	Would go to Rocky mountains, 5 yrs exp. mountr'g.
K. C. Siddall	Islington, Ontario	3	Civil	Steel or conc. constrn. design'g., estimat'g. or survey'g.	3 mos. highway wrk.; 6 mos. conc. brdge wrk.; 2 mos. survey'g.	
J. C. Higbee	189 Huron St., Toronto, Ont.	3	Civil	Steel or conc. constrn. surveying.	5 mos. instrumt'man.	
H. A. McKay	119 Essex Ave., Toronto, Ont.	3	Civil	Survey'g., highway or reinf. concrete	3 mos. struct. steel shop; 2mos. rein. conc. constrn. 3½ mos. struct'l. steel co., as draughtsm'n.	
R. C. Leslie	304 Windermere Ave., Toronto, Ont.	3	Civil	Any sort of engineer'g. work.	3 yrs. house constrn.	
P. C. Davidson	583 Bathurst St., Toronto, Ont.	2	Chem.	Travel'g. or chemic'l. eng. wrk. in Toronto.	Factory labour, quarry wrk. and mine wrk.	
J. H. Ings	52 Albany Ave., Toronto, Ont.	2	Civil	Constrn. or survey'g.	2½ mos. C.N.R. surveys; 4 mos. Dominion Ship Bldg. Co.	
C. T. Sharpe	75 Jameson Ave., Toronto, Ont.	2	Civil	Railr'd. survey'g., or constrn. work	5 mos. as blaster at Hollinger Gold mines.	Returned soldier.
K. V. Heyland	441 Gladstone Ave., Toronto, Ont.	2	Civil	Construction	7 mos. lumber shipper.	
T. D. Churchill	72 Indian Road, Toronto, Ont.	3	Electrical		3 mos. Bell Telephone Co; 15 mos. Marconi Wireless Co.	
A. W. McQueen	Nottawa Simcoe Co., Ont.	4	Mech.		9 mos. struct. work-Collingwood Shipbuilding Co; 12 mos. heat treatment on shells; 5 mos. machine shop work	

Elections and Transfers

At the meeting of Council held on March 21st, 1922, the following elections and transfers were effected:—

Members.

Claude C. Curtis, B.S. (M.E.) (Univ. of Mich), manager, Cape Breton Electric, Co. Ltd., Sydney, N.S.

Albert Dawes, div'l. engr., Nova Scotia Steel & Coal Co., Ltd., Sydney Mines, N.S.

Louis Elgin Jones, (Univ. of Toronto 1911), asst. engr., Dept. Public Highways, Province of Ontario, Toronto, Ont.

Godfrey Dean Rhodes, (Grad. R.M.C.), chief engr., Uganda Rly., Nairobi, King's Colony, East Africa, (Major, Royal Engrs.)

Frank Newman Speller, B.A.Sc. (Univ. of Toronto), metallurgical engr., National Tube Co., Pittsburg, Pa.

Associate Members.

Charles Mills Ainslie, Major, Garrison Engr., Military Works Service, Poona, India.

John Vickers Angus, asst. gen. mgr., Armstrong-Whitworth of Canada, Limited, Montreal, Que.

Claus Marius Bang, B.Sc. (M.E.) Polytechnical Academy, Copenhagen, designer on engr'g. staff, Wayagamack Pulp & Paper Co. Ltd., Three Rivers, Que.

Thomas Arthur Barnett, gen. supt., Twin Falls power house and dam, for Morrow & Beatty, Falls View, Ont.

Frank Bowness, asst. foreman, dfting. dept., Can. Gen. Elec. Co., Peterborough Ont.

Leon Brunet, C.E. Polytechnic School, Montreal. senior asst. engr. in charge of engr'g. staff, Dept. Public Works, Quebec.

Chester Scott Clendening, res. engr., Lethbridge Northern Irrigation District, Lethbridge, Alta.

Arthur Gibb Cushing, B.Sc. (McGill Univ.), asst. supt., gas distribution dept., Montreal Light, Heat & Power Co., Montreal, Que.

Thomas Clinton Dennis, B.Sc. (McGill Univ.), geodetic engr Geodetic Survey of Canada, Ottawa, Ont.

Ovide Cyrille Edouard Fournier, B.A.Sc. (Laval Univ.), 1st asst., drainage location party. Reclam. Service, Dept. Interior, Ottawa, Ont.

Manfred Freeman, commissioner of public utilities, City of Lethbridge, Alta.

Richard Dobson Harper, district engr., Good Roads Board, Winnipeg, Man.

Franklin Ernest Holland, C.E. (Cornell Univ.), sales engr., Sherwin Williams Co. of Canada Ltd., Montreal, Que.

Eric Ian Henry Ings, (Grad. R.M.C.), instr'man., Lethbridge Northern Irrigation District, Lethbridge, Alta

John Hayes Jenkinson, manager, The Dominion Tar & Chemical Co. Ltd.. Sault Ste. Marie, Ont.

John Frank Lawrence, B.Sc. (McGill Univ.), supt. of shops, Laurentide Co., Grand Mere, Que.

Maurice Frank Ronald Lloyd, canal supt., Lethbridge Section, C.P.R., Irrigation Branch, D.N.R., Nagrath, Alta.

Hector MacNeil, B.Sc. (Mass. Inst. Tech.), C.N.R., Saskatoon, Sask.

Enos Maybee, foreman, dfting dept., Can. Gen. Elec. Co., Peterborough, Ont.

William L. McKenzie, owner and mgr., W. L. McKenzie & Co., Electrical Engrs., Lethbridge, Alta.

Harold Arthur Morey, B.Sc. (Dartmouth Univ.), mill. engr., Spanish River Pulp & Paper Mills Ltd., Sault Ste Marie, Ont.

William Burnthorne Musgrave, B.Sc. (Queen's Univ.), office engr., Division No. 1, Chippawa-Queenstown Power Development, H.E.P.C. of Ontario, Chippawa, Ont.

Kenneth Hutchinson Smith, private practice, Wolverhampton, England.

Raymond Robert Stevenson, B.Sc. (Univ. of N.B.), junior engr., Welland Ship Canal, Thorold. Ont.

Duncan Gair Sutherland, contracting engr., Winnipeg Electric Rly. Co., Winnipeg, Man.

William McKay Sutherland, checker and designer, Dominion Coal Co., Glace Bay, N.S.

Aubrey Clifton Tabor, B.Sc. (Univ. of N.B.), of Fredericton, N.B.

Wilfred Gordon Ure, B.A.Sc., (Univ. of Toronto), member of firm, F. J. Ure & Son, Civil Engrs. and Surveyors, Woodstock, Ont.

William Martin Veitch, special asst. in charge of design of sewers and disposal plants for City of London. Ont.

H. Alton Wilson, (Univ. of Toronto "11), technical editor of engineering publications, Montreal, Que.

Juniors.

Thomas Bristol Bradley, instr'man., Section No. 5, Welland Ship Canal, Welland, Ont.

Frank Harold Emmerson, in charge of dfting room, section No. 3, Welland Ship Canal, Thorold, Ont.

F. Darrell Gifford, district vocational officer in charge of Peterborough District, D.S.C.R., Peteborough, Ont.

Earl Alexander Gray, asst. engr. Public Utilities Commission, London, Ont.

John A. C. Johnston, dftsman, Dominion Coal Co., Ltd., Glace Bay, N.S.

Gordon McIntyre, B.Sc. (McGill Univ.), chemist, Imperial Oil, Limited, Regina, Sask.

John Stewart Mewburn, instr'man., Welland Ship Canal, Niagara Falls, Ont.

John Clarence Mitchell, B.A.Sc. (Univ. of Toronto), acting sec.-treas., Webster Constrn. Co. Ltd., London, Ont.

William Herbert Nixon, B.A.Sc. (Univ. of Toronto), res. engr., Toronto and York Commission, Toronto, Ont.

Ambrose Aloysius Paoli, B.A. (Queen's Univ.), 4th year student Queen's University, Kingston, Ont.

Allan Hugh Russell, asst. to city engr., Sault Ste Marie, Ont.

James Frederick Shelton, dftsman, Welland Ship Canal, Thorold, Ont.

Associates

Frederick Denille Burpee, mgr., Ottawa Electric Railway, Ottawa, Ont. Erle E. Eisenhauer. B.S.A. (Univ. of Sask.) instructor in irrigation in the prov. schools of agriculture at Raymond & Gleichen, Alta.

Gilbert J. P. Jacques, private practice architect and engineer, Windsor, Ont.

Duncan Angus MacLean, constrn. eng., Dominion Iron & Steel Co., Sydney, N. S.

Transferred from the class of Associate Member to that of Member.

James Aubrey, Burnett, Contltg. & Appraisil engr., Smart & Burnett., Montreal, Que.

John Goodwill Macphail, BSc. (Queen's Univ.), commissioner of lights, Marine Dept., Ottawa, Ont.

Dominic Edward O'Brien, C.E. (Univ. of Toronto), senior asst. engr., Welland Ship Canal, St. Catharines, Ont.

George Linton Watson consltg.-engrs., New York, N.Y.

George Clark Wright, B.Sc., (Queen's, engr., and vice-president Kingston Constrn.. Co. London, Ont.

Transferred from the class of Junior to that of Associate Member.

Leonard Edgar Allen, Civil Service, Ottawa, Ont.

Richard Griffith Boast, B.Sc., (McGill Univ.), engr. mtce of way, T. & N.O. Rly., North Bay, Ont.

Walter George Hunt, B.Sc. (McGill Univ.), constrn. engr., Laurentide Co., Grand Mere Que.

William Earle Longworthy, B.A.Sc. (Univ. of Toronto), sewerage engr., City of Regina, Sask.

Augustin Jean Papineau, C.E. (Ecole Polytechnique), local mgr. at Amqui, for St. Lawrence Lumber Co. Ltd.

Alexander Pirie, asst. engr., Dom. Water Branch, Vancouver, B.C.

Rupert Harrington Reif, B.Sc. (McGill Univ.), Hollinger Mining Co., Timmins, Ont

Robert Donald Thexton, asst. engr., Eastern Constrn., Nigerian Rly., Enugu, British West Africa.

Transferred from the class of Student to that of Associate Member.

Charles Alexander Doherty, sub-area officer, rank of Major, Civil Service Air Ministry, Hitchin, Herts, England.

Guy Adamson Lindsay, B.Sc. (McGill Univ.), hydraulic engr., St. Lawrence River Improvement Investigation, Dept. of Rlys. and Canals, Ottawa, Ont.

Charles Clarence Rance, B.A.Sc. (Univ. of Toronto), ass . engr., H. T. Routly, Toronto, Ont.

Andrew Murray Robertson, B.Sc. (McGill Univ.), divisional traffic engr., Bell Telephone Co., Montreal, Que.

Transferred from the class of Student to that of Junior.

Pierre Maurice Chaussee, chief dftsman., Montreal Water Board, Montreal, Que.

Arthur James Edward, B.Sc., (McGill Univ.), chem. engr., in operation of St. Maurice Lumber Co., New Mill, International Paper Co., Three Rivers, Que.

Charles Errington, (Grad. R M.C.), hydrometric recorder, Dominion Water Power Branch, Dept. of the Interior, Calgary, Alta.

John Austin Loy, B.Sc. (McGill Univ.), inspr., Dept. of Public Highways, Ontario, Ottawa, Ont.

Gordon Leslie Mackenzie, B.Sc. (Queen's Univ.), associated with J. E. Underwood, Consltg. Engr., Saskatoon, Sask.

Alphonse Trudeau, B.Sc., (McGill Univ.), of Ste Anne de Bellevue, Que.

PERSONALS

Merle J. Ker, Jr.E.I.C., has been appointed engineer to the Township of Stamford.

Geo. E. Stephenson, Jr.E.I.C., has been appointed engineer of Bruce County, Ont.

F. N. Sinclair, A.M.E.I.C., is now chief engineer of Sumas Dyking District, Kilgard, B.C.

Lieut.-Col. W. G. Tyrrell, D.S.O., M.E.I.C., has moved from Ireland to Paignton, S. Devon, England.

John Buss, S.E.I.C., formerly at Mille Roches, Ont., is now with the Bogalusa Paper Company, Inc., at Bogalusa, La.

Lt.-Col. H. D. St. A. Smith, D.S.O., A.M.E.I.C., recently returned to Calgary from Mesopotamia, where he was engaged in irrigation work.

Donald M. McLean, Associate E.I.C., is now on the engineering staff of the Dover Boiler Works at Dover, N.J.

C. B. Kingston, M.E.I.C., is now with the African and European Investment Company Limited at Johannesburg, South Africa.

Captain R. D. Thexton, F.R.G.S., Jr.E.I.C., has been appointed assistant engineer, Eastern Construction, Nigerian Railway, British West Africa.

W. L. Ball, A.M.E.I.C., has been transferred to the office of the engineer of Standards, Canadian National Railway, Old Union Station, Toronto, Ont.

H. W. Perkins, A.M.E.I.C., formerly of Toronto has accepted a position in the Highway Department of Minnesota is now resident in St. Paul, Minnesota.

Fred Clark, A.M.E.I.C., has been appointed superintendent of the Lethbridge Northern Irrigation Project with Grant Smith and Company and McDonnell Limited, contractors.

James Adam, A.M.E.I.C., formerly with the Department of Civil Re-Establishment has secured a position with the Tropical Oil Company at Cartagena, Colombia, South America.

P. A. Landry, A.M.E.I.C., has been appointed representative of the Curry Cormac Corporation Limited dealing in machinery supplies at Room 4, 288 St. James Street, Montreal.

H. A. Terrault, A.M.E.I.C., superintendent engineer in charge of the workshops and yards and fuel supervision of the sewer pumping system has been appointed by the City of Montreal.

W. B. Crombie, A.M.E.I.C., formerly with Morrow and Beatty Matheson has excepted a position in the Forestry Department of the Abitibi Power and Paper Company, Iroquois Falls, Ont.

M. C. Garroni, A.M.E.I.C., of Winnipeg is sailing from New York early in April for a lengthy trip to the Mediterranean. Mr. Garroni expects for the next six months to be resident in Malta.

A. C. D. Blanchard, M.E.I.C., a member of the Niagara Peninsula Branch gave an illustrated address on the Queenston-Chippawa Power Development to the Peterborough Branch on the 9th of March.

L. W. Wynne-Roberts, A.M.E.I.C., has severed his connection with the Ontario Department of Public Highways and has been appointed manager of the Chatham office of Frank Barber and Associates, consulting engineers.

A. W. McMaster, A.M.E.I.C., whose paper on Silica Brick was published recently in *The Journal* has been appointed assistant general sales agent of the Dominion Coal Company Limited and is now resident in Montreal.

W. E. Walsh, Jr.E.I.C., has severed his connection with R. McDougall Company Limited, Galt, Ont., and has accepted the position as junior mechanical engineer with The Canadian Crocker Wheeler Company Limited, at St. Catharines, Ont.

A. G. Hill, A.M.E.I.C., has opened an office in Kent Building, Toronto, as mechanical and civil engineer. He has been appointed representative of a number of engineering firms dealing in boiler power house equipment, air compressors, steam engines, and rock crushing equipment, etc.

Past-President Dr. Martin Murphy, M.E.I.C., suffered the loss of a son, and John J. Murphy, A.M.E.I.C., of the Ottawa Branch, and M. J. Murphy, A.M.E.I.C., Secretary-Treasurer of the Moncton Branch, a brother, in the death at Montreal on February 25th, of Martin Murphy, Jr.

W. G. A. Adams, A.M.E.I.C., has recently severed his connection with the Michigan Avenue Holding Company to become engineer and general manager of the Oakwood Construction Company, Limited, a new Canadian corporation which has been formed to undertake construction of municipal work. Office will be opened shortly by the Oakwood Construction Company, Limited, at Windsor, Ont.

In his new office, incorporated with those of the George A. Johnson Company, consulting engineers, Colonel Watson in addition to serving his personal clientele, will collaborate on the engineering work of the Johnson Company, which includes surveys, reports, designs and supervision of construction of water works, water purification plants, sewerage systems, sewage disposal plants, refuse disposal stations, power developments and numerous other branches of civil, electrical and mechanical engineering.

Colonel George L. Watson, A.M.E.I.C., has removed his office from 16 West 41st Street to 150 Nassau Street, New York City, at which latter address he will continue his consulting engineering practice. Colonel Watson's experience covers a wide field in mining, tunnel, bridge, harbour improvement, pipe line and sewerage work in the United States; and extensive diversified experience in connection with the engineering corps of the British and American Armies in Europe during the World War. He is a member of the Board of Consulting Engineers to the New York State Bridge and Tunnel Commission and the New Jersey Interstate Bridge and Tunnel Commission.

F. H. Palmer, A.M.E.I.C., Junior Trade Commissioner, Department of Trade and Commerce, Commercial Intelligence Branch, has written an article on "Export Credit Schemes" which appears in the March issue of the Commercial Intelligence Journal, published by the Department of Trade and Commerce, Ottawa. This article deals with the history of export credit schemes, divided into three parts: the period up to the International Financial Conference at Brussels in 1920, the Conference itself, where a definite international scheme was adopted for consideration by the various states, and the post-conference period with the consequent development of the adopted international scheme of credits. Mr. Palmer left Ottawa on the 12th of March to tour British Columbia and the Prairie Provinces, going through to Victoria and visiting the various centres in these Provinces on his return trip.

George Hogarth, M.E.I.C., at the recent convention of the Association of Ontario Land Surveyors was elected president of the Association. Mr. Hogarth is a native of Ontario, having been born and educated in Toronto, and has elected to remain in his native province. He graduated from the University of Toronto in 1909, and after a short period of experience in railway work joined the staff of the Ontario Department of Public Works being assistant engineer from 1910 to 1916. During this period, Mr. Hogarth was interested in a number of important undertaking of the Department, including the Magnetawan Lock, the Winnipeg River Bridge, etc. His work was recognized by promotion to the office of chief engineer of the Department of Public Highways of the province of Ontario, which position he now holds. The notable work of Ontario in construction and maintenance of good roads is too well known to need emphasis. Mr. Hogarth has been a strong supporter of the Good Roads movement, in co-operation with W. A. McLean, M.E.I.C., deputy minister of highways for the province. Mr. Hogarth has been a member of *The Engineering Institute* when he joined as a Junior member, being transferred to Associate Member in 1913, and to Member in 1918.

Energetic Coast Councillor

Major George A. Walkem, M.E.I.C., who has recently been elected Councillor, has been an active member of *The Institute* since 1906 when he began a strenuous record of *Institute* service on his election as Associate Member. Major Walkem was born in King-

GEO. HOGARTH, M.E.I.C.
President of Association of Ontario Land Surveyors

GEO. A. WALKEM, M.E.I.C.
Member of Council

ston, Ontario, in 1872, and received his technical training at McGill University, from which he graduated in Mechanical Engincering in 1896.

Shortly after graduation he followed Horace Greeley's advice, and accepted a position with the B.C. Electric Railway Co., at Vancouver, in connection with the construction and installation of trackage. Following two years of private practice as consulting mechanical engineer Major Walkem was appointed general manager of the Vancouver Engineering Works with which company he remained from 1900 to 1906 when he became managing director of the Vancouver Machinery Depot Ltd. During the war Major Walkem saw active service in Egypt and Palestine with the Royal Engineers, when he was in charge of construction of all new stations, yards, etc. He has been active in support of all movements in British Columbia for the welfare of the engineering profession and was one of the original promotors of the Act incorporating the Association of Professional Engineers of British Columbia of which he is a Councillor. In addition to these many activities Major Walkem is interested in the civic life of Vancouver, being a director of the Vancouver Exhibition Association, the Vancouver General Hospital, and the Children's Aid Society of Vancouver. As a man and an engineer Major Walkem is one of the most popular on the Coast.

BRANCH NEWS

Vancouver Branch

F. H. Buchan, A.M.E.I.C., Secretary-Treasurer.

For several years, the British Columbia members of *The Institute* have been anxious to extend the courtesy of a Western Professional Meeting to their Eastern brethren. We have all felt that the natural charm of our beautiful province, together with its obvious importance in the engineering field, lend especial interest to such an undertaking. During the past two months, desire has been translated into action, and the Vancouver and Victoria Executive Committees have been conferring, with the object of making arrangements to hold a Western Professional Meeting during the coming summer.

At the general meeting of the Vancouver Branch, on the 16th March, Mr. Brakenridge was able to announce that the hearty co-operation of the Victoria Branch was assured, and that it had been provisionally decided to hold the meeting in Vancouver, on the 16th and 17th of June, if the Canadian Good Roads Congress, which is scheduled to meet in Victoria on the 13th to 16th June inclusive, can be arranged for the 12th to 15th instead. Failing this, *The Institute* meeting might be held in Victoria on the 16th and Vancouver on the 17th June.

Mr. Brakenridge's announcement was received with considerable pleasure and a resolution endorsing the action of the Executive Committee was carried unanimously. Steps have now been taken to obtain the sanction of the Council, and it is hoped that British Columbia may have the honour of issuing the invitation in the near future.

A general meeting of the Vancouver Branch was held in the Board of Trade Auditorium on Thursday, 16th March at 8.15 p.m. About fifty members were present, the chair being occupied by Mr. Brakenridge.

Several important matters of business were discussed, among which was the proposal to hold a Western Professional Meeting, as reported elsewhere in this branch news.

To foster the town planning movement in British Columbia, a special committee consisting of C. Brakenridge, M.E.I.C., W. H. Powell, M.E.I.C., and W. B. Young, A.M.E.I.C., was appointed, with power to add to their number.

Following the chairman's announcement that the Executive Committee held the opinion that the Branch could carry on without the collection of Branch dues a resolution was passed unanimously, confirming the action of the Executive.

A very interesting lecture, illustrated with a large number of lantern slides was given by William Smaill, B.A.Sc., M.E.I.C., on the "Construction of the Greater Winnipeg Water District Aqueduct. The difficulties encountered in the work, due to the muskeg and the numerous river crossings were very clearly demonstrated and the ensuing discussion kept Mr. Smaill quite busy answering the numerous questions of his interested audience. He was accorded a very hearty vote of thanks.

British Columbia Provincial Division

In the Branch News column of the March issue of *The Journal*, there was outlined the problem confronting the engineering profession in British Columbia, which has arisen out of the numerous organizations requiring the collection of annual dues. A measure of relief was realized in the decision of the general meeting of engineers held on January 7th last, to abandon the British Columbia Technical Association, even at the sacrifice of certain highly desirable functions, which that body was able to perform when the occasion required. To those members of the profession who are in close touch with the general situation, it has become increasingly apparent, that it would be most undesirable for the Association of Professional Engineers to dissipate its energies over too wide a field. Rather, it should confine its duties more particularly to the administration of the Professional Engineers' Act, for which purpose it was created. Nevertheless, the urgent need of a substitute for the B.C. Technical Association has been finding expression in various attempts to form new bodies, as for instance, the applications for chapters of the Association of Professional Engineers. Apart from the more vital aspects of these movements, further complications in the financial problem are threatened thereby; and it has become obvious that some solution must be provided in the near future to meet this dilemna.

The first condition to be satisfied, is the provision of a body which would be common to the whole of British Columbia, and which could act in conjunction with the Association of Professional Engineers, relieving that body of professional duties extraneous to the administra-

tion of the act. The second condition is that it must not depend for its existence on further levies of fees. The third point is that it should have branches empowered to deal with local problems not affecting the general welfare of engineers in the province. The last-named feature is of considerable importance, because it has evidently been felt in certain localities that the main body of the Association of Professional Engineers in Vancouver, may not be in sympathy with the local points of view in some of these questions, resulting in unfair decisions, either through lack of adequate representation on the Council or complete misunderstanding of local conditions.

Having appraised the situation in the manner just outlined, it became very apparent to the Executive Committee of the Vancouver Branch, that *The Institute* could provide a ready-made channel for finding these manifestations of energy in a direction highly advantageous to everyone concerned. The solution was simply the reorganization of the British Columbia Provincial Division. This body could act as a Provincial Headquarters, with branches at strategic points, empowered to deal with local affairs, and represented on the executive committee of the Provincial Division as provided in Section 60 of *The Institute* By-laws. Branches are already established in Vancouver and Victoria; and it would be a comparatively easy matter to create others wherever the situation might demand. The B.C. Division has been authorized by the Council; and, as can be readily seen on page 36 of the 1922 "Charter, By-Laws, etc.", is merely awaiting the election of the officers and members of its executive committee. Thus we have ready-made machinery for meeting conditions *one* and *three* in an ideal manner. The question of fees is unimportant, it being confidently believed that no serious outlay of funds will be entailed, either in the reorganization or maintenance of the Provincial Division. When it is realized that behind *The Institute* activities in British Columbia, is the influence and support of nearly five thousand members throughout Canada, among whom are most of the leading figures in the engineering profession of the Dominion, there can be no room for doubt that the plan of the Vancouver Executive will be a success if carried through, and that not only will *The Institute* be a powerful champion of the British Columbia engineer, but it will materially add to its own strength and prestige in Canadian national life.

In order to expedite matters, the Vancouver Executive Committee appointed a sub-committee of three, at a recent meeting to inquire into the subject of a Provincial Division and report to the next meeting of the Executive. Following this, the matter will be formally laid before a general meeting, when it is hoped that authority will be granted to proceed with the undertaking, as outlined.

Branch Library

Members of *The Institute* will be interested in knowing that steps have been taken to improve the library at 930 Birks Building. On 25th January last, a meeting of secretaries of the various professional bodies using these joint quarters was held, with the object of deciding on some plan which could be recommended to their respective executives and which would have the effect of co-ordinating effort, to the lasting benefit of the joint library scheme.

At present, the bulk of the books and periodicals in the library are the property of, or on loan to *The Institute*. one of the recommendations submitted, required that the ownership and custodianship of books be plainly marked; and in the case of loaned books, that the name of the private owner, and the society having the custodianship of each book, be recorded. Then in the event of any society wishing to withdraw, it would be possible for that body to take possession of its own books and remove them as soon as desired.

A joint Library Committee was recommended which would be composed of one delegate from each of the organizations participating in the scheme, and which would have complete supervision of the library and all matter pertaining to it. By this means it was believed that proper co-operation could be secured, while still preserving the right of individual ownership, and the identity of each society.

The Association of Professional Engineers has appointed J. Muirhead, M.E.I.C., as its delegate. The Vancouver Branch of *The Institute* made an appointment, but the delegate tendered his regrets, so that a further appointment will have to be made at the next meeting of the Executive Committee.

It is confidently believed that a very noticeable improvement in the usefulness and scope of the library will be experienced when the Joint Committee takes over its duties.

The Registrar of the Association of Professional Engineers of British Columbia has announced that the following members of the E.I.C. were admitted to membership in his Association on the 18th February, 1922: Wm. McGie Young, M.E.I.C., consulting engineer, Standard Bank Bldg., Vancouver, B.C.; J. P. Mackenzie, A.M.E.I.C., Supt. Loomis, McFee, Henry and Macdonald, contractors, Vancouver, B.C.; F. A. Devereux, A.M.E.I.C., Box 306, Victoria, B.C.

Calgary Branch

J. A. Spreckley, A.M.E.I.C., Secretary-Treasurer.

Floyd K. Beach, A.M.E.I.C., Branch News-Editor.

On February 24th, G. P. F. Boese, A.M.E.I.C., read a paper prepared by H. B. Muckleston, M.E.I.C., on "Actuarial factors in the design of Irrigation Structures". This paper was previously read before the Lethbridge Branch and appears in another section of *The Journal*. It provoked considerable discussion among the membership present. On the same occasion A. S. Dawson, M.E.I.C., gave some notes on "Actuarial Factors governing the use of creosoted timber in Irrigation Structures". Mr. Dawson intimated that the C.P.R. Natural Resources are starting investigations into the comparative life of treated and untreated timber in irrigation structures and when comparative data becomes available he will present them to *The Institute* through the Branch.

Annual Meeting

The annual meeting and election of officers was held following a luncheon at the Board of Trade on March 11th. The retiring chairman, B. L. Thorne, M.E.I.C., called for reports from the various committees. Among the recommendations may be mentioned the following as pertinent to the successful operation of the Branch.

R. S. Trowsdale, A.M.E.I.C., Chairman of the Mmembership Committee reported that it was felt by the committee that its duties should be shared by the whole Branch membership. Each individual member should make known the eligible persons the manner in which membership may be attained and should see that prospective members secure application blanks. The Committee as such should not be continued, and in its place there should be an active committee to secure attendance at meetings by reminding the membership on the day of meeting. It was felt that a higher percentage of attendance would do more for the Branch than larger membership.

G. W. Craig, M.E.I.C., Chairman of the Programme Committee pointed out that during the 15 months since the last general meeting, there have been seventeen meetings as against seven in the previous 12 months. He recommended the continuance of the Committee. Reports of other committees were heard, but as they brought up no matters of general interest to *The Institute*, they are not here repeated.

Arthur L. Ford, M.E.I.C., retiring Secretary-Treasurer, submitted a report bringing conditions of the Branch up to date as compared with the report at the end of the calendar year. He showed that the finances are in a sound condition and that the funds of the Branch now stand at about a thousand dollars. Revenue during the 15 months amounted in approximate figures as follows:—

Rebates from parent *Institute* and dues of affiliates	$265.00
Interest on bonds and savings	47.00
Branch news	81.50

Among his recommendations was the proposal that the Programme Committee arrange for more papers, even if brief ones, from the younger members. His other recommendations were very good, but being matters of internal economy are not repeated here.

A canvas of votes for officers for the ensuing year showed that a much larger vote than usual was cast, probably due to the fact that the new by-laws require at least two names for each of the executive committee and a real election rather than an acclamation resulted.

Officers for the year are:—

Chairman........P. J. Jennings, M.E.I.C.
Secretary.........J. A. Spreckley, A.M.E.I.C.
Treasurer.........G. P. F. Boese, A.M.E.I.C.

Ex officio:...... V. Meek, A.M.E.I.C., F. E. Emery, A.M.E.I.C., F. K. Beach, A.M.E.I.C. B. L. Thorne, M.E.I.C., P. Turner Bone, M.E.I.C. (Councillor)......G. W. Craig, M.E.I.C.

Following the announcement of election results from the scrutineers, P. J. Jennings, M.E.I.C., took the chair and addressed the meeting as follows:—

Chairman's Address

Before proceeding with any further business I would like to take a few minutes to express my thanks for the honour you have conferred upon me in electing me to the position of Chairman for the enduing year. I need hardly say that I highly appreciate the honour and shall endeavour to carry out the duties of the office to the best of my ability. I fully recognize that the standard which has been set by those very capable engineers who have preceded me has been a very high one, but with the support of the Executive Committee and the members of the Branch, I feel confident in predicting another successful year.

We have now 101 members in the Calgary Branch, made up, as follows:—

Members	22
Associate Members	59
Associates	2
Juniors	6
Students	5
Affiliates	7
	101

It is hoped during the coming year to considerably increase this membership and particularly in the Associate and Student class.

Out of a membership of 101 there should be no difficulty in obtaining at least two papers per month during the coming year—excluding the summer period. I know there is a large number of members who have information which would be useful to other members of **The Institute**, and I make a personal appeal to you individually to prepare a paper for the coming fall or winter session. It is not necessary for it to be a very long paper, so long as it contains some useful information, and we all have some information which could be passed on with advantage and be of benefit to us and **The Institute** generally. It is only by such means that this or any technical society can be a success, and I know you are all anxious that this Branch shall continue to prosper and be of value and service to us all. My appeal is, therefore, to you all to make a special effort during the coming year to help **The Institute** along.

Suggestions for Improving the Branch.

I should be pleased to receive any suggestions that may from time to time occur to members with a view to improving the Branch, of stirring up interest in our meetings, or of methods whereby we can improve our society and benefit ourselves. Although we are not an institution formed for the purpose of meeting for social intercourse in the true sense of the words — yet there is no reason for restricting ourselves at all our meetings to entirely technical subjects, and some little variety might possibly be introduced from time to time.

The Outlook for the Engineer.

I wish I could induce someone to write a paper on this subject, I feel sure it would be interesting and it is certainly a subject upon which much could be said. During the past year you have had an opportunity of discussing a report which was submitted on "Classification and Remuneration", and although a great deal of thought and time has been spent by various committees of engineers throughout the Dominion, we have not yet achieved a great deal. I do think, however, that some good ground work has been done and when the time arrives for taking some definite action the information will be available and useful. Our past-president informed us last year, informally, that before we could expect any general betterment in the way of remuneration, we must first raise our standard of ethics. I have not the time now, nor is this the occasion, upon which to discuss this question but I merely wish to mention it in passing with the hope that it may lead to some discussion at a forthcoming meeting.

The engineer constitutes the basis of all industrial progress throughout the world and no matter what branch of the industry is considered the engineer is the pioneer and prime mover. The inception, design, construction and subsequent successful operation of any work has to be carried out by the engineer and he is, always has been, and always will be an indispensable factor in the progress of civilization.

It is undoubtedly very satisfactory to the real engineer — the man who has his profession at heart and loves it for its own sake, to know that he is doing something which is really useful for the world's progress. Many of the members of this **Institute** here in Alberta can look with considerable pride upon the results which are now maturing and the progress which must rapidly follow as the result of their work and study. I refer particularly to the works which have been conceived, designed and constructed during the past ten or fifteen years in connection with irrigation development in this province. The same work is being undertaken to-day and many of those who are now engaged upon the preliminary studies and investigations of big development projects for the betterment of mankind will live to see the results of their labours. It may surprise many of you here to know that the engineers of this province have already been responsible for the design and construction of works for irrigation and water supply which have resulted in an expenditure of well over $35,000,000. But this is only a mere fraction of the amount that is likely to be expended in the further development of the water resources of the West during the next decade, the foundations for which are now being laid.

The engineer has not yet come into his own but the day is fast approaching when he will receive greater consideration for his work than he has in the past. You may think I am being carried away with over optimism as to our future, but I do not think so. Apart from his technical training the engineer is generally a good organizer and I may say that many of the thinking business men of to-day are looking to the engineer to straighten out some of the tangles into which many of the cities and towns of the West have got during the past few years. I, therefore, look for the appointment of engineer city managers in the very near future. Edmonton has already placed her affairs in the hands of an engineer and I am pleased to note good progress has already been made toward recovery.

The Natural Resources.

With the possibility in the near future of the turning over to the province of her natural resources, I am again optimistic as to the effect such a change will have upon the engineering profession. For instance, I look for larger expenditures on good road construction, reclamation by drainage of the thousands of acres of valuable swamp lands in the north, the development on a large scale of our tar sand deposits and a continued development in irrigation. Then there are the untold possibilities of development which will result if oil is found in commercial quantities.

In conclusion, gentlemen, I may say the prospects in Alberta for the engineer are such that there is no need for pessimism. There are at the present time very few engineers out of employment in Alberta, which in view of the present general condition of the money market is certainly gratifying.

I note from the current number of **The Journal** that of the many research problems suggested for the consideration of the Bureau of Standard and Research — no mention is made of one of the greatest problems facing the west at present time — I refer to concrete deterioration in alkali soils. **The Institute** has a splendid committee of Western engineers who are doing as much as can be done without having large funds at their disposal, but there is at present no real solution of the problem.

Edmonton Branch

R. H. Douglas, A.M.E.I.C., Secretary-Treasurer.

The regular monthly meeting of the Edmonton Branch was held in the Board of Trade Chambers on Thursday evening February 16th.

C. A. Robb, A.M.E.I.C., Chairman of the Edmonton Branch, presided.

Three fifteen-minute papers were given, each paper being followed by a fifteen-minute discussion.

Col. George McLeod, A.M.E.I.C., gave an interesting talk on Drainage Problems, dealing with the question of rainfall, disposal and the reclamation of lands. An explanation of the workings of the "Drainage Act" was also given. The Honourable J. L. Coté, A.M.E.I.C., led in the discussion following the paper, and A. McDonald, provincial drainage engineer, gave an description with costs of various drainage schemes that have been constructed and are being constructed in the province.

E. K. Hall, A.M.E.I.C., divisional engineer of the C.N.R., gave an instructive description of Edmonton to North Battleford and the Onoway to Whitecourt lines of the Canadian National Railway. Mr. Hall dealt with the constructive difficulties and also gave a comprehensive description of the country traversed, together with the commercial importance to Edmonton as a result of the construction of these lines.

Dr. K. A. Clark in his paper dealt with the possibilities of the bituminous sands of Northern Alberta. Dr. Clark pointed out that while the known deposits are of enormous extent, it is only those portions which are exposed along the sides of river valleys that can be excavated without encountering overburdens so excessive in thickness as to make the cost of development prohibitive. The valley outcrops, however, according to Dr. Clark, can provide ample material to satisfy all demands of the immediate future. Dr. Clark also stated that while the bitumen contained in the bituminous sand constitutes a direct source from which to prepare asphaltic products, such as those used for road construction purposes, this bitumen does not constitute a direct source from which to obtain satisfactory yields of gasoline, kerosene and lubricating oils by operations now practised in the petroleum industry. Dr. Clark's conclusions as a result of his studies were that owing to the distance of the deposits from centres of population their development depends upon the discovery of a suitable method of separating the bitumen from the sand. The bitumen free from sand should then be of sufficient value to stand the cost of transportation. Also the conversion of the bitumen into gasoline, kerosene and lubricating oils by means of distinctive distillation may prove a profitable method of developing the deposit.

In the discussion following, which was opened by Mr. Stansfield, much additional interesting information was brought out.

Winnipeg Branch

Geo. L. Guy, M.E.I.C., Secretary-Treasurer.
E. V. Eaton, A.M.E.I.C., Branch News Editor.

On the 2nd March 1922, at the regular meeting of the Branch, E. P. Fetherstonhaugh, M.E.I.C., in the chair, a paper was read by D. L. McLean, M.E.I.C., on the "Engineering Aspects of Drainage Problems".

Mr. McLean dealt with the whole question of drainage in a very able manner. He showed that over one seventh of the agricultural area of Manitoba was now within organized drainage districts and that there was approximately one million acres of land which could be made serviceable by proper drainage. The speaker emphasized the necessity for this work being done on a comprehensive basis and for the control to be under one head, instead of under the different municipalities. He discussed very fully the present laws in Manitoba with reference to drainage and a comparison was made between these laws and those of the other provinces.

Local News

The annual banquet of the Engineering Association of Manitoba University was held on the 3rd, March. A large number of the members of *The Institute* attended and in the speeches by members of the profession emphasis was laid on the desire of the practising engineers to assist the new graduates in every way. The banquet was a great success and enjoyed by all.

Municipal Engineering

At the regular meeting held on Thursday evening, 16th March, E. P. Fetherstonhaugh, M.E.I.C., in the chair, a series of papers was read upon the duties and responsibilities of municipal engineering. These papers were really a progress report of a special committee which had been appointed to take up the matter.

The subject was introduced by Professor J. N. Finlayson, M.E.I.C., and the following members of the Committee addressed the meeting:—W. E. Hobbs, A.M.E.I.C., W. Aldridge, A.M.E.I.C., J. W. Battershill, A.M.E.I.C.

Mr. Finlayson in his opening address mentioned the advantage of the Committee method of preparing papers. The present Committee had consisted of twelve members and a large number of meetings had been held. It had been decided to divide the subject under five headings:—

1. Duties and responsibilities of the municipal engineer.
2. Fundamental data.
3. Water works supply.
4. Sanitation.
5. Other utilities.

The speaker emphasized the necessity for more uniformity in design and construction of public works, particularly when looking forward to the possible future absorption of all outlying municipalities into one Greater Winnipeg. At the present time many points of difference are found among the adjacent municipalities which would entail either serious inconvenience or great expense to secure uniformity at some future date. There are also many other matters worthy of proper consideration; such as sewerage treatment and the question of the proper treatment of the water supply at some future date. A suggested organization chart for the municipal engineer's staff was shown, suitable for the average size of city and details were given of the various members on the staff and their particular duties. The failure on the part of many municipalities to appreciate the worth of the municipal engineer, upon whose duties the lives and welfare of the community actually depend, was emphasized by the speaker. He also made a strong plea for a more liberal education for the engineers and was emphatic in his statement that, while liberal studies were somewhat difficult to acquire unless they had been acquired in early life, many subjects of a highly specialized nature which were now dealt with by the technical colleges were quite assimilated by persons who had been properly grounded in the fundamentals of the science. This inclined him to believe that the curriculum of a technical college should include the more liberal arts and some of the highly specialized courses could quite well be dispensed with.

W. E. Hobbs, A.M.E.I.C., emphasized the necessity for study of the growth of the population and pointed out that unless this could be fairly accurately determined it was very difficult to economically design municipal works. He dwelt upon the necessity for designing these works of sufficient capacity to accommodate the possible increase in population during the life of the works. This necessitated the knowledge of the probable growth, which, while it was difficult to actually determine, could at the same time be fairly closely estimated for a maximum possible, which should be the basis for the construction of the various works. By proper town planning, not only would great economies be possible, but it would also be much easier definitely to determine the class of structures which would have the longest useful life. The figures given showed that 44% of the population of Manitoba was in Greater Winnipeg and with the improvements in conditions which would shortly take place the necessity for more economic distribution of the population and definitely defining of areas for commercial, manufacturing and residential purposes was emphasized.

Mr. Aldridge took up the subject of sanitation. The necessity for accurate rainfall data was explained and curves were shown for storm rain falls, the speaker explaining how these were derived and showing actual figures obtaining as against theoretical figures collected from different data available. The disposal of sewerage and the question of the pollution of the rivers and streams was dealt with and it was shown that the Red River with its minimum flow was sufficient to handle the sewerage for a population of half a million. Descriptions were given of actual sewer conditions and construction in and around Winnipeg, the most satisfactory construction having been found to be vitrified clay blocks with a natural cement mortar, the grades of the sewers being laid out to have a maximum flow of three feet per second. Refuse disposal was also dealt with. Costs and debenture issues were dealt with and the methods of charging assessment were explained.

Mr. Batterhill dealt with the water supply for municipalities. He emphasized the necessity for uniformity in design of the different water systems and the advantage of standardization in all fittings and fixtures. In the laying out of domestic water mains he pointed out that where both fire and domestic usages were required from the same mains the fire requirements set the standard and increased the cost from one third to one half above what would be required for purely domestic use. The Winnipeg standards for first class residential districts were given as 1800 Imperial gallons per minute at a 50 pounds pressure, and for the second class districts 1200 Imperial gallons per minute at 50 pounds pressure. The location of the water cocks, gate valves, hydrants and depth of mains was also discussed and the various types of meters and the necessity for standardization.

Sault Ste. Marie Branch

F. Theo. Gnaedinger, A.M.E.I.C., Secretary-Treasurer.

Heating Buildings

The January meeting of the Branch was held as usual on the last Thursday in the month. Papers were read on the subject of heating buildings and fuel testing. The discussion of these papers was very interesting as all the members had had some experience or other with the heating of buildings.

The selection of the most suitable and economical fuel for the purpose of heating the public schools of the city was the subject of a paper by L. H. Derrer, S.E.I.C Mr. Derrer acted in a consulting capacity to the School Board this year when they were making a choice of coal for their winter requirements. His paper described the different kinds of furnaces installed in the different schools, and the tests he carried out with two kinds of coal, pocohontas and bituminous. The tests were made to determine the amount of water evaporated per pound of coal under conditions as nearly uniform as possible in all cases, and under the A.S.M.E. code. The "equivalent evaporation per pound of coal from and at 212 degrees Fahrenheit" was computed for both coals in each furnace and used as a basis for comparison. The results of the tests were given and their use shown in the selection of the coal which was purchased by the School Board. It was estimated that a comparatively large sum was saved by buying coal on the basis of how much it cost to raise a pound of steam instead of merely on its price per ton.

The actual amount of heat required to heat a building and keep it comfortable was the subject of a paper by W. S. Wilson, A.M.E.I.C. On account of his absence from town the paper was read for him by the Secretary.

In his paper Mr. Wilson said that in Algoma it was necessary to heat buildings artificially from seven and one-half to nine months, according to the type of occupancy, and that both proper construction and adequate heating of buildings is required for comfort.

The principal source of loss of heat is by conduction This is measured in British Thermal Units, being the rate per square foot of wall surface per degree of difference of temperature between inside and outside air, per hour using a coefficient to represent the different types of construction. Many of these coefficients are published but care must be used in applying them. Coefficients for some types of construction are not available. Long vertical spaces like flues between inner and outer walls should be avoided.

Infiltration is an extremely important factor in all but the most carefully constructed buildings. Determination of air changes by infiltration is made by carbon dioxide determination which is difficult to use satisfactorily. The simplest way to stop leakage around windows is to use weatherstrip, preferably the recently developed forms of metal weatherstrip, which will cost $1.50 to $2.00 for material for windows of ordinary size and about $3.00 per window for labour for putting on. Some tests in the Bureau of Mines Building at Washington, D.C., quoted in the Journal Am. Soc. H. & V.E., a building of high class construction with windows weatherstripped and doors closed, showed for some rooms six to ten changes of air per hour. If that holds for a good building what must be the case in many of our poorly constructed buildings — and what a fuel waste at times when air is not needed for ventilation!

The heat regulation of the human body is an extremely interesting function and is marvellously efficient — a slight rise we call fever, and five or six degrees means a great danger; a slight lowering is injurious and a considerable lowering a fatal end. The body produces heat from oxidizing foods and it can absorb heat by radiation and to a slight extent by conduction from warm food in the alimentary canal. The body loses heat by radiation, by conduction (in warming food the above process from a thermal standpoint reversed is included), by warming air in the respiratory tract and by evaporation. Radiation and conduction can be controlled to a large extent by proper clothing. Evaporation, however, is dependent upon humidity and air movement to a large extent. The body can adapt itself to a great range of humidity if other factors are favourable. Movement of air accelerates evaporation and will to a varying extent offset the effects of humidity.

To produce proper humidity is difficult. Note the evaporation problem we have! Air from outside at a low temperature is introduced sometimes by design, sometimes by infiltration, into our homes or offices. Its natural moisture content is quite low at a low temperature. At seventy degrees its capacity for moisture is considerable, where can it find this moisture? Will it absorb all the moisture it can get from plants, utensils with water, and from the skin and lungs of the occupants? The active evaporation will produce a feeling of chilliness and the air will become a vehicle for the easy circulation of fine dust, carrying germs, which is inhaled and irritates the respiratory system. This is possibly the cause of much disease, probably of pneumonia.

A schedule showing the more general methods of heating was exhibited, and also a schedule showing characteristics of several buildings in Sault Ste. Marie, as well as types of heating plants and radiation installed, and fuel consumed per cubic foot of contents.

Industrial Plants and their Location

The February meeting was postponed until the second of March. A paper was read by F. Theo. Gnaedinger, A.M.E.I.C., on "Industrial Plants and Their Location".

A brief survey was made of the broad field of industrial engineering. Some of the principal features governing the selection of a site for a plant, both as to the locality and the actual site, were outlined and the necessary points to be studied were presented in the form of tables. The chief studies of the engineer engaged in planning, designing and constructing a plant were gone into and a scheme was given for covering the details of such work in a systematic way. In handling such a large subject in a paper it was necessary to deal with it only in general terms, and this was done. The use of flow-sheets as an aid to design was taken up and examples were given of the principal types: organization, process or operations

machine, and a combination type. The promoting, organizing and financing of an industry not infrequently come within the field of the larger professional engineering firms, but as these subjects were another phase of engineering they were considered outside the scope of the present paper. Blue-prints illustrating the different types of flow-sheets, and copies of the tables given in the body of the paper were passed around the meeting.

Among the items of business transacted at the meeting was a resolution which was passed expressing the Branch's approval of the aims and objects of the Honorary Advisory Council for Scientific and Industrial Research. The Secretary was instructed to forward a copy of the resolution to Council with an offer to render the Council such assistance as lay within the power of the Branch. At the same time he was to get in touch with the local M.P., and notify him that the Branch approved of the founding of the National Research Institute and requesting his views and assistance along these lines.

Sometime in the near future the Branch expects to have an address from Major Alex. C. Lewis, secretary of the Canadian Deep Waterways and Powers Association. The Sault is very interested in the objects of the Association and anticipates a large turnout at the projected meeting.

B. E. Barnhill, M.E.I.C., Vice-Chairman of the Branch, read a report of the Secretaries' Meeting held in Montreal at the time of the Annual Meeting. A Committee was appointed to draw up resolutions favourable to the proposals of the Montreal meeting, which will be formally passed at a later meeting of the Branch.

London Branch.

Geo. C. Wright, A.M.E.I.C., Secretary-Treasurer.
R. I. Olmsted, A.M.E.I.C., Branch News Editor.

A regular meeting of the Branch was held in the Council Chambers of the City of London on February 22nd, in which A. J. Grant, M.E.I.C., engineer in charge, Welland Ship Canal, gave a very interesting address illustrated with lantern slides, on the design and construction features of this work.

Mr. Grant in introducing the subject gave a brief resumé of the early canals along the St. Lawrence and across the Niagara Peninsula. The points covered by the address included:—Selection of the route, design, harbours, locks, bridges, construction features, and bearing the canal will have as a connecting link in the Great Lakes and St. Lawrence waterways scheme.

The lecture was highly appreciated by those present who were not engineers, as it gave them an idea of the size of the work undertaken and the difficulties which had to be overcone during construction.

Discussion of the address followed in which E. V. Buchanan, M.E.I.C., manager Public Utilities Commission, F. W. Farncombe, M.E.I.C., consulting engineer and J. R. Rostrom, A.M.E.I.C., took part.

The Chairman H.A. Brazier M.E.I.C. presided, and the meeting included several civic officials including Mayor Cameron Wilson as well as some thirty members.

A unanimous vote of thanks was tendered Mr. Grant for his excellent address.

Niagara Peninsula Branch

Rex. P. Johnson, A.M.E.I.C., Secretary-Treasurer.
G. R. Taylor, A.M.E.I.C., Branch News Editor.

A dinner meeting was held at the Welland Hotel, St. Catharines, on the 15th of March, with N. R. Gibson, M.E.I.C., the Branch Chairman, presiding. About 60 members and friends were present.

After the transaction of some Branch business the Chairman called on the speaker for the evening, H. C. Don Carlos, chief operating engineer for the Hydro-Electric Power Commission of Ontario, to give his paper on "The Operation and Maintenance of Generation and Transmission Systems".

Mr. Don Carlos stated that the H.E.P.C. were operating twelve generating systems and distributing 375,000 H.P. He outlined the office and field organizations and pointed out the need for flexibility, in order that emergencies might be rapidly and efficiently dealt with. He pointed out the great advantage of operating experience for any engineer engaged in the design and layout of electrical equipment, although it was difficult to induce designers to acquire practical operating experience. They had several examples on their own systems in which operators had suggested improvements in design that had been adopted by the manufacturers. One of the personal questions in operation not yet satisfactorily settled was the effect of the three 8-hour shift system on the health of the men. The shift system is, of course, necessary but it is supposed to be somewhat injurious to health and that problem has not yet been solved.

A detailed account of the Ontario Power Company's plant at Niagara Falls was given and some very interesting slides of ice conditions shown. The lecturer pointed out the great advantage to turbine maintenance caused by the utilization of electric welding. It is interesting to note that in 1917 the Ontario Power Company's Plant operated at ninety-seven per cent of its maximum capacity throughout the twelve months. This is probably a record for continuous operation.

The Niagara System exhibits some particularly interesting problems in operation and maintenance owing to the varying distances at which power is transmitted, and to the varying voltages at which it is delivered. The various methods of voltage and frequency regulation were outlined. The modern turbine governing systems greatly facilitate the frequency regulation. The lecturer praised the reliability of the modern transformer. At one time all transformers were returned to the manufacturers for repairs when necessary, but now the H.E.P.C. repair their own up to 5,000 K.V.A. capacity. Oil switches appear to give more serious trouble than any other type of equipment and need careful inspection at regular intervals and always after they have opened for short circuit, when the oil should be renewed.

The high voltage lightning arrester is of interest. The electrolytic type is on the whole satisfactory, though the maintenance cost is high. The oxide film type is being installed at most of the new stations. It is very satisfactory and is gradually replacing the older types. Most of the H.E.P.C. local distribution systems are tied in to other systems so that in the case of a breakdown in

a local station the load can be carried by other systems, thus ensuring an unusual reliability of service to consumers. The lecturer gave it as his opinion that in many cases sufficient attention was not given to the grounding of the structural steel in transformer stations and other buildings, and gave examples of serious accidents caused by this neglect. Transmission lines are designed to carry a coating of half an inch of ice with a 50 M.P.H. wind at 20 degrees below zero. It would be very unusual to find these three adverse conditions at the same time, and as a rule the transmission lines give little trouble and are readily handled by ordinary maintenance. It is not considered economical to construct a line capable of withstanding the worst conceivable weather, it being cheaper to handle the emergency when it occurs, which may only be once in several years. Tower construction is very satisfactory, tower failures being almost unknown. The careful and systematic testing of line insulators for leakage greatly helps to maintain the efficiency of the system. Some interesting slides showed the methods of testing as well as the method employed in changing insulators with the line alive, a method in considerable favour in the Southern States.

The lecturer briefly outlined the work of the metering and inspection department, the patrol gangs and the special repair gangs. He questioned the utility of the sky wire except in open tree-less country. All points of the H.E.P.C. system are connected up by private telephone wires which must be carefully protected from induction. In order to further overcome the possibility of a breakdown in communication, wireless telephone installations are being put in at the main stations.

Weekly load diagrams were shown for various municipalities. It is interesting to note that in the smaller municipalities where dwelling houses are the main consumers, the Tuesday load is invariably the highest. The speaker suggested this was caused by it being ironing day.

Discussion of the address followed in which N. R. Gibson, M.E.I.C., Chairman of the Board, J. R. Bond, A.M.E.I.C., Rex. P. Johnson, A.M.E.I.C., F. L. Code, S.E.I.C., F. W. Clark, A.M.E.I.C., and others took part.

Hamilton Branch

W. F. McLaren, M.E.I.C., Secretary-Treasurer.

Engineering Standardization

The Branch met at the Royal Connaught Hotel on February 16th, 1922, at 8.15 p.m., to hear an address on Engineering Standardization by R. J. Durley, M.E.I.C., Secretary of the Canadian Engineering Standards Association, Ottawa.

The speaker first gave a general outline of the work and noted the following branches or divisions:—

1. Dimensional standardization, having for its object economy and convenience arising from the interchangeability of parts.

2. Nomenclature and definitions.

3. Elimination of unnecessary types and sizes, thus economizing by reducing the amount of stock to be carried and simplifying production.

4. Fixing standards of performance and methods of testing, so that the methods of determining the capacity of a machine and its performance will be thoroughly understood both by purchaser and manufacturer.

5. Standardization of methods of construction and workmanship or operation; as exemplified in connection with standard bridge specifications, and the safety code work which is being so largely developed in the United States.

6. Standard specifications for materials. These are prepared with a view of unifying the requirements for quality and methods of testing, as well as reducing the number of unnecessary varieties of material called for or kept in stock.

It was pointed out that while these methods of standardization are very largely applied by individual firms in their own work, the object of an association like the C.E.S.A. is to extend this field of usefulness by obtaining, if possible, nation-wide agreement over the whole extent of an industry, the essentials being that the interests of both manufacturers and purchasers must be represented.. In the formation of committees for this purpose, the assistance of trade or industrial associations is often extremely valuable. It is also necessary that agreements reached by working committees should be submitted to a central organization in order to avoid the over-lapping of well meant individual efforts.

In most countries, engineering standardization is now carried out by voluntary organizations enjoying a measure of government support, but exceptions to this are France and Japan, where at present the engineering standardization work is done by Government Commissions.

Dr. Agnew, the Secretary of the American Engineering Standards Committee, has drawn up a memorandum which very clearly and concisely outlines the work. He brings out the following advantages which may be realized if standardization is carried out:—

1. Buyer and seller use the same language.
2. It promotes fairness.
3. It reduces costs of manufacture.
4. Lower prices are paid for materials.
5. It decreases litigation.
6. It eliminates indecision.
7. It decreases selling expenses.
8. Fewer lines are carried and these are of better quality.
9. It stimulates research.
10. It enables the results of research to be put to practical use.
11. It eliminates practices which are merely traditional, because when specifications are criticized, unnecessary features are exposed.
12. It bases competition on efficiency only.

The British have been pioneers in the work of standardization of this kind, the earliest example being of course the introduction of the Whitworth thread by Sir Joseph Whitworth. The British Engineering Standards Association was formed in 1901, and has now over 2,000 working members in its various committees. It has published over 150 reports, specifications, etc., and has

formed local committees in various parts of the world, such as China, the Argentine, etc., with a view of encouraging the use of British standards. The work of the B.E.S.A. received a great impetus during the war when the value of standardization was very impressively demonstrated by the rapid technical advances made owing to the pooling of information among manufacturers.

In the United States the work of engineering standardization dates back some twenty years, the first bodies interested in it having been the A.I.E.E. and the A.S.M.E. There are now over one hundred technical societies and bodies engaged in this work in the United States, and the American Engineering Standards Committee which was formed in 1918 as a central co-ordinating body, does not originate standards, but acts as a clearing house for those drawn up by the various technical associations.

The work carried on in the various countries of Europe was briefly outlined.

A brief outline was given of the work of the Canadian Engineering Standards Association, which, of course, has the close sympathy and support of *The Engineering Institute of Canada*. The C.E.S.A. work, like that of the British and Belgian Standards Associations, has so far dealt rather with standard specifications than with dimensional work and it would appear likely that in view of the close manufacturing relationship between Canada and the United States, work of the latter type will be largely influenced by American practice.

The C.E.S.A. was formed in 1919 with the object of carrying out in Canada, for the benefit of Canadian industry, works similar to that done in England by the British Engineering Standards Association, which has proved of such great industrial value. The Canadian Engineering Standards Association is not a Government institution, although it is recognized by the Canadian Government. The members of the Association, who serve on its committees gratuitously, are qualified by their technical and industrial standing to represent the interests of manufacturers, engineers and users, and members of the Main Committee are nominated by such bodies as the Canadian Manufacturers' Association, the Canadian Institute of Mining and Metallurgy, *The Engineering Institute of Canada*, the engineering schools of the universities, the railway services, important industrial firms, and the great purchasing departments of the Canadian Government.

The Association has been incorporated by Dominion charter, and is financed by contributions from the technical and industrial societies interested, as well as from individual firms, and these are supplemented by a grant from the Dominion Government.

When a request or suggestion is received from some responsible firm or person to the effect that the formulation or revision of a C.E.S.A. Standard is desirable, the Association confers with the various interests likely to be affected by the establishment of such a standard, and arranges for the organization of a committee to consider the matter. This committee includes representatives of the producers and users of the standard in question together with such technical advisers as may be considered desirable. The selection of such a working committee is accomplished through the proper sectional committee of the Association, under the chairmanship of a member of the Association. If the committee so formed recommends the adoption or modification of a standard, its findings are reviewed by the Association, the Main Committee of which must be thoroughly satisfied that full consideration has been given to the subject before it authorizes publication by the Association.

So far five publications have been issued and two more are under discussion.

The address was closed by throwing on the screen slides showing samples of the standards sheets adopted by various countries.

The chair was occupied by E. H. Darling, M.E.I.C., who threw the meeting open for discussion, which was participated in by Messrs. Bertram, Hart, Palmer, Williams and Martin, and closed with a hearty vote of thanks to Mr. Durley for his able address. The attendance was about 40, and it was announced that there would be a joint meeting with the A.I.E.E. on 24th March, and possibly there would be another meeting arranged before that date.

Power House Construction

A meeting was held in the Royal Connaught Hotel, 3rd March 1922, to hear F. H. Farmer, M.E.I.C., engineer for the Canadian Westinghouse Co., on "Construction Work".

Mr. Farmer said in part, as follows:—This paper deals with construction work incidental to installation of electrical equipment in power houses. There is much to recommend that the installation of such equipment should be handled by the manufacturer, especially in the larger sizes of machinery, since this places on the manufacturer the responsibility of completing the work and placing in operation, and ensures that the apparatus will be installed to the manufacturer's satisfaction. It is the usual practice to include in the contract the installation and subsequent operation of generators for a specified period by the manufacturer, and usually in the case of large transformers. There is a tendency for purchasers to install switching equipment by their own staff.

One difficulty which is frequently encountered is the late date at which access to the building is available, which usually results in undue pressure being placed upon those engaged in construction work to rush completion of apparatus. This often calls for premature commencement of installation operations under unfavourable conditions.

The history of the electrical industry is marked by the every increasing size of units. In the space of 15 years, hydro electric generators have increased from 7500 K.V.A. to 45,000 K.V.A. The bearing of this on installation work is marked, much of the work which was formerly completed in the manufacturer's factory, being now of necessity carried out on the site on account of shipping limitations. The handling of apparatus at the site should be fully covered by contract, and careful enquiry must be made into the facilities for handling from the cars to the site.

In Canada the problem usually met is to couple up a generator to a turbine which has already been placed. No hard and fast rules are to be laid down for lining up vertical and horizontal machines, the method being decided by the engineer in charge of the work. On vertical machines the line up is not complicated by any consideration of sag in the shaft. It is essential however that the guide bearings should line up very accurately with the turbine shaft. The vertical alignment of guide bearings is dependent on the levelling of the bedplate and it is therefore necessary to secure the greatest possible accuracy in setting the bedplate in the first case.

The use of a spirit level has limitations for such work on account of the fact that it only determines the level of a short portion of a machined face, and the use of a long straight edge is open to the objection that it will have a certain amount of sag. The most satisfactory method appears to be the use of a good engineer's level with a suitable target, preferably with a hairline subject to micrometer adjustment.

After assembling the guide bearings a check will be made for vertical alignment. This can be best carried out by using a heavy plumb bob whose vibrations are damped by immersion in oil. A fine piano wire strained close to its elastic limit is recommended to suspend the plumb bob. This will be adjusted so as to be central with top of the upper guide bearing, and measurements may be taken to the inner surface of the bearings at different points by means of a light pin gauge. After the shaft has been inserted a final check between coupling faces is made by means of feelers and the gap may be checked within ".001.

In the case of a horizontal shaft machine there will be a sag in both the turbine shaft and the generator shaft, with the result that if the four bearings are set at the same elevation the coupling faces will be close at the bottom and wide at the top. It will be necessary to raise the outboard bearing of the generator in order that the coupling faces may become parallel in order that no strains be introduced between the shafts and couplings. The rectangular form of the bedplate of horizontal machines is very liable to assume distortion due to the holding down bolts and care is necessary to see that it does not become twisted or distorted.

The placing of the shaft in the rotor is usually carried out as a field operation. This will be done either by pressing in cold, or by heating the hub and shrinking on to the shaft where the hub is solid. Where the hub is slotted it is drawn into the shaft by means of shrink rings or shrink keys. The fitting of pole pieces requires considerable care. Each pole piece is fitted to its own slot and the key paired and driven. They are then removed and scraped to a good fit before they are finally driven home, and it is essential that they should be driven right to the limit. Where it is necessary to carry out complete winding at the site, it is very desirable that the power-house should be in good condition as regards freedom from moisture and exposure to weather.

After completion and before placing in operation, a thorough dryout of the machine is essential. This will usually be done by running the machine at low speed with winding short circuited, and adjusting current to a suitable point. The ventilation should be restricted so as to allow of a fairly high temperature in the winding. Temperatures will be recorded and insulation resistances taken periodically. Drying will be continued until the insulation resistance reaches a steady value after which the machine is ready for voltage test and commercial operation.

In the handling of transformers the essential feature is to ensure that the transformer cores are not subjected to exposure to atmosphere any more than absolutely necessary. The usual method is to ship transformers in oil, either in their own tanks if size permits, or otherwise in suitable shipping tanks to be transferred to their own tanks at their destination. The oil should be drawn in under vacuum in the latter case to ensure that there will be no air pockets at any part of the winding. If for any reason the cores are not shipped immersed in oil, a complete dryout of the transformer becomes necessary, and this is preferably carried out by subjecting the tank containing core to vacuum and heating by means of applying voltage to the primary with the secondary winding short circuited. Particular attention will be paid to the cooling coils to ensure that there are no leaks which might allow water to escape into the oil

The paper was illustrated by means of a series of slides showing various transportation problems, methods of handling apparatus during erection, and several special conditions. In conclusion a number of pictures were shown illustrating the erection of 45,000 K.V.A. Westinghouse generators at Queenston Power house.

Mr. Darling was Chairman, and the attendance about 100. Mr. Hart moved a hearty vote of thanks which was carried with applause.

Toronto Branch

F. B. Goedike, M.E.I.C., Secretary-Treasurer.
C. R. Young, M.E.I.C., Branch News Editor.

At the meeting held on March 2, H. A. Goldman, A.M.E.I.C., presented a most thoughtful paper on the rise and fall of prices comprising a study of price movements during the past 100 years, with particular reference to the effect of the supply of goods and gold. This paper was published in advance proof form in *The Engineering Journal* for March. An animated discussion followed Mr. Goldman's paper in which the following members took part: Professor Peter Gillespie, M.E.I.C., R. O. Wynne-Roberts, M.E.I.C., G. W. Winckler, M.E.I.C., Frank Barber, M.E.I.C., and others. Announcement was made at this meeting that C. H. Rust, M.E.I.C., had presented a large nember of bound volumes of "Engineering Record" to the Branch. In a formal motion the thanks of the Branch were tendered to Mr. Rust for his exceedingly valuable gift.

Law and Engineering

A valuable presentation of the legal contacts of engineering was made at the meeting of March 9 by Alfred Bicknell of the legal firm of Bain, Bicknell, MacDonell and Gordon who spoke on "Some Legal aspects

of Engineering Problems". Mr. Bicknell, in describing the nature of law, deplored the fact that no codification had yet been made of the law of engineering and construction in Canada. On account of the necessity of hunting up many amendments a clear understanding of the law was difficult except by a trained lawyer. The speaker outlined carefully the essentials of a valid contract, laying emphasis on the fact that there must be a clear offer and a clear acceptance. Wherever new terms are introduced in the proposal, or if an acceptance is conditional, there is no binding contract, unless both parties clearly agree to the changes that have been made. The tender, said the speaker, may be withdrawn any time before acceptance, whether it be accompanied by a deposit check or not. If acceptance is required in a definite or prescribed manner, there is no contract unless it be so carried out. Mr. Bicknell pointed out the danger attending the making of contracts with municipal corporations which require the authority of by-laws to undertake certain enterprises. If such by-law has not been passed the contractor is not able to obtain compensation for his work. In order to take legal action against the Dominion or Provincial Governments it is necessary first to obtain a fiat of the Minister of Justice or of the Attorney General, respectively and then proceed by petition of right. Mr. Bicknell pointed out that even governments have no authority to modify the terms of a definite contract, citing the case of the invalid ordering of certain extras on a wharf contract by a Minister of Public Works in the Dominion Government. As the contract definitely stated that extras would only be allowed on the written order of the engineer-in-charge, the contractor was unable torec over for the extras.

Following the address a vigorous discussion occurred. J. B. Carswell, A.M.E.I.C., pointed out objectionable features of many contracts from the point of view of the contractor. He drew attention to the standard contract form prepared by the Canadian Association of Building and Construction Industries and urged that action be taken on this form by the Council of *The Institute* to whom it had been submitted a year ago. J. M. Oxley, M.E.I.C., objected to plans being classed as goods under the law and asked also what the powers of a municipal commission were in retaining expert assistance by the mere authority of the executive head of the Commission. E. M. Proctor, A.M.E.I.C., expressed the view that where the mayor of a municipality secures the employment of an expert without the authority of a by-law he should be held liable on the ground of breach of warrant of authority. In speaking of the binding nature of verbal agreements, Mr. Proctor cited a case where a contractor had built a bridge on the verbal instructions of the municipal council without definite by-law or written resolution. Although the validity of this agreement was questioned, the contractor was able to obtain payment for his work by appealing to the courts. Wm. Storrie, M.E.I.C., asked if it were necessary to wait until a nuisance had actually been created before applying for an injunction to restrict the parties contemplating such objectional act.

A. T. C. McMaster, M.E.I.C., A. Ross Robertson, A.M.E.I.C., T. L. Crossley, A.M.E.I.C., R. J. Fuller, A.M.E.I.C., H. A. Goldman, A.M.E.I.C., W. J. Smither, A.M.E.I.C., G. G. Powell, M.E.I.C., and C. R. Young, M.E.I.C., also took part in the discussion.

Mr. Bicknell , in commenting on the various observations made on the address, stated that acceptance of an offer might properly be made by telegram but a confirmation was most desirable to avoid possible errors in transmission. The status of the architect or engineer on the work which had been questioned by some was definitely outlined in the contract, said the speaker, In some respects the engineer was an impartial arbitrator between the two parties, and in others he was an agent of one of the parties. The authority of a municipal commission to enter into contracts should be based upon this status as a trading corporation. Mr. Bicknell was of the opinion that a motion adopted in Council, with a seal attached was in effect, a by-law. He stated that it was not necessary to wait until a real nuisance had been created before applying for an injunction. If it could be established that a contemplated act would undoubtedly create a nuisance the injunction could be obtained beforehand.

At the executive meeting which preceded the programme for the evening the matter of securing advertising for *The Journal* was discussed by Mr. Maxwell representing headquarters of *The Institute*. It was decided to refer the matter to the incoming executive for consideration. In consideration of their services to the Branch the present Secretary and the immediate Past Secretary were each granted an honorarium of $100.

Annual Meeting

The meetings of the Branch for the present session were concluded on March 16 when the annual meeting was held. Reports of committees were received and discussed and the new officers were elected and installed.

Geo. T. Clark, M.E.I.C., Chairman of the Branch, in making his retiring address described briefly the progress that had been made by the Branch during the year. Financially some useful work has been done, including, amongst other things, the wiping out of an old obligation of $199 to the Engineers' Club for book-cases and work done in connection with the library. The sum of $125 had been advanced to the library committee for necessary improvements and an honorarium of $100 each had been voted to the present and the immediate past Secretaries. Mr. Clark warmly commended Willis Chipman, M.E.I.C., and Col. H. J. Lamb, M.E.I.C., for their indefatigable work in connection with engineering legislation.

F. B. Goedike, M.E.I.C., Secretary-Treasurer, reported a cash balance of $37.425 with an outstanding check of $125, thus giving a surplus of $249.25. Col. H. J. Lamb, M.E.I.C., Chairman of the Finance Committee, confirmed the report of the Secretary-Treasurer.

The Chairman of the Branch, in reporting for the membership committee, pointed out that a conisderable number of students who had applied for membership a year ago had not taken up their memberships and consequently the membership of the Branch now stands at about 450, although it had appeared that it was considerably greater than this.

C. R. Young, M.E.I.C., Chairman of the Publicity Committee, reported the extent of the efforts of the committee toward obtaining publicity for the activities of the Branch and the degree of success attained. J. M. Oxley, M.E.I.C., in discussing the report deplored the fact that the daily newspaper almost always neglect to give the names of the engineers connected with a piece of work that is being described.

T. D. Mylrea, A.M.E.I.C., Chairman of the Committee on Ethics, reported that not much progress had been made during the year, but expressed the view that the work should be continued.

J. M. Oxley, M.E.I.C., Chairman of the By-Laws Committee, outlined the work that had been done by that Committee in preparing the amendments which had been submitted to the membership for sanction by ballot. H. L. Seymour, A.M.E.I.C., Chairman of the Town Planning Committee, submitted a statement of the town planning activities in this part of the country as observed by the members of the Committee.

T. L. Crossley, A.M.E.I.C., Chairman of the Committee on Sociology, reported progress and pointed out some useful lines of activity which might be pursued in the future. R. O. Wynne-Roberts, M.E.I.C., Chairman of the Reception Committee, urged that every effort be made to assist the Committee in obtaining the correct addresses of members.

A. C. Oxley, A.M.E.I.C., Chairman of the Library Committee, stated that the $125 grant was being used to bring up to date the Proceedings of the American Railway Engineering Association and to purchase a number of valuable text-books which, in the opinion of the Committee, should be in the Library. G. G. Powell, M.E.I.C., in discussing the report urged that an appraisal of the books owned by the Branch be made with a view to a possible increase in insurance. Frank Barber, M.E.I.C., expressed the view that the insurance was not sufficient and that not enough money was being spent on the library. It was resolved to refer the matter of appraisal and the insurance to the new executive.

J. G. Jack, A.M.E.I.C., Chairman of the Committee on Employment, reported that there had been a lack of positions offered and so the Committee had not been able to do any useful work.

J. M. Oxley, M.E.I.C., reported that as special representative of the Branch on the Committee appointed to consider the Lightning Rod Act, he had carried out the duties assigned to him and the Act as now revised had been passed by the Legislature.

Votes of thanks were passed to Willis Chipman, M.E.I.C., and Col. H. J. Lamb, M.E.I.C., for their work in connection with legislation in Ontario and also to Geo. T. Clark, M.E.I.C., for his untiring efforts in promoting the welfare of the Branch during the past year. H. A. Goldman, A.M.E.I.C., and T.L. Crossley, A.M.E.I.C., who had been appointed auditors, reported to the meeting that the books of the Secretary-Treasurer had been examined and found correct.

The Nominating Committee, of which G. A. McCarthy, M.E.I.C., was chairman, acted as scrutineers, and reported that the following had been elected to office for the ensuing season: Chairman, Wm. Storrie, M.E.I.C.; Vice-Chairman, E. G. Hewson, M.E.I.C.; Secretary, Treasurer, F. B. Goedike, M.E.I.C.; Executive: R.C. Muir-M.E.I.C., N.D. Wildon, A.M.E.I.C., and W. A. Duff, M.E.I.C.

The retiring Chairman then turned over the meeting to the Chairman-elect, Wm. Storrie, M.E.I.C., who, in accepting office, regretted the fact that through the fortunes of the election the services of some valuable members of the executive would be lost for the coming year. He expressed the view that the position of Chairman of the Branch, at least, should be filled by acclamation and that certain advantages would accrue from the Branch electing an executive and the executive then electing the officers. F. B. Goedike, M.E.I.C., and W. A. Duff, M.E.I.C., of the new executive expressed their appreciation for the support given them by the members.

Students' Night

Encouraged by the success of their last meeting, the Students' Committee, E.I.C., held another Students' Night in Hart House on February 6th. Again the lecture room was filled with enthusiastic undergraduates and engineers evidencing the popularity of this unique event. The four papers presented by undergraduates were very carefully prepared and were extremely well delivered.

A. M. Reid, S.E.I.C., chairman of the Students' Committee, opened the meeting by announcing that he had become an adherent of the principle of decentralization or "passing the buck" so he was going to ask H. S. Weldon, S.E.I.C., to take the chair for the evening. Mr. Weldon and H. S. Clark, S.E.I.C., were responsible for the organization and advertizing of the meeting and to them goes the credit for the success of the gathering.

"Breaking Rock in Drifts and Tunnels" was the subject of the first paper given by J. Drybrough. Rock excavation was of interest to most branches of engineering, although only indirectly in some cases. It had been done since the dawn of history but the bulk of the progress had taken place since 1850. In Northern Ontario, the hammer drill is almost exclusively employed and gives efficient service. The types of rounds used in drifts are the wedge cut, diamond cut, draw cut, and burn cut. In larger tunnels the same cuts, but with slight modifications, are used.

In presenting the paper on "Primary Triangulation" H. G. Rose, D.L.S., made what might appear a dry subject decidedly interesting. Primary triangulation consists of a series of points on the earth's surface which form the vertices of triangles whose sides average over twenty miles in length. The purpose of such a triangulation is to give a control for topographical survey work. Figures are chosen with the triangles interlaced to give a check on the observed angles. The latter are adjusted by the method of least squares. In Canada up to the present, the triangulation is being used as a control for hydrographic survey work, Militia Department Topographical maps and for accurate mapping of some of the principle cities.

Mr. Weldon then called upon Prof. H. E. T. Haultain, M.E.I.C., who in a short talk laid great emphasis on the need for an "Engineering Spirit" among the members of the profession.

Speaking on Small Water Powers, T. S. Glover, Jr.E.I.C., drew attention to the large number of uses to which small water powers could be put, but caution and thorough preliminary investigation were necessary. As an example of the work of preliminary investigation, the speaker outlined his experiences in Northern Newfoundland, last summer, whilst engaged on work of this nature for Dr. Grenfell, of Labrador fame.

In commenting on Mr. Glover's paper, Dean Mitchell complimented him very highly on his ingenuity in surmounting difficulties due to lack of equipment. Professor Angus who assisted Mr. Glover in an advisory capacity, next pointed out the difficulty of developing small water powers at a reasonable cost per horsepower.

The fourth and last paper was read by R. A. H. Galbraith, Assoc.I.R.E., S.E.I.C., on the subject of "Radiotelegraphic Transmitters".

Mr. Galbraith outlined the principles and applications of the "spark" and "arc" types of transmitters, and made some reference to the "valve" type of transmitter. In this connection, he produced for inspection by the meeting, several different types of "power valves". It is regretted that lack of time precluded more than passing reference to the existence of a fourth type of transmitter, namely the "radio-frequency alternator".

Peterborough Branch

D. L. McLaren, A.M.E.I.C., Secretary.

The regular meeting of the Branch was held on February 23rd and was addressed by Thos. W. Gibson, deputy minister of mines for Ontario, and Dalman Neeley, secretary of the Mine Owners' Association of Ontario. These gentlemen impressed upon their audience the importance of the mining industry as a factor in the prosperity of the country, the potential value of the products of the mines of Ontario, and also that mining is a legitimate and necessary industry and not a gamble for stock brokers.

Mr. Neeley threw much light on the potentiality of the industry. "Mining is a basic and essential industry," he said. "If there was no mining we would be living in the stone age. Mining has been the mainspring of colonization of New Ontario," he declared. Less than one-fifth of Canada is suitable for agricultural; the other four-fifths must be devoted to lumbering, fur-trading and mining, and of these three, mining is the most important.

World history, he said, showed that on the heels of the miner inevitably came colonists, and primarily the credit for settling must be given to the men seeking precious metals. The speaker recalled the common teachings of not so long ago, now exploded, that New Ontario was a useless wilderness. Only those who are well acquainted with that country, he said, realize what the future holds for it.

In the growth of Timmins, the centre of the Porcupine mining district, the progress of the country is shown. Twelve years ago, where this town now stands was a trackless waste of rock and scrub. Last year the freight receipts of the railroads there was only exceeded by one town in Ontario. The town assessment is $2,225,000, last year's pay roll was $4,500,000. and bank clearings for 1921 totalled $7,000,000. an amount in excess of the total for any other town under 10,000 population in the Province.

Mr. Neeley defended the nickel companies, who, he said, had been unjustly criticized. The companies, during the war, never increased the price to the British Governments above their 1913 prices.

In concluding, he emphasized the fact that every business man in Old Ontario should be interested in the development of the Province's mineral resources, for, directly or indirectly, he was affected by their prosperity or poverty.

The deputy minister of mines for Ontario, Thos. W. Gibson, traced the development, of gold mining in Ontario from a small beginning up to its present large production. His address was illustrated with lantern slides and motion pictures.

Queenston Chippawa Development

The assembly room of the Chamber of Commerce proved to be entirely too small to accommodate the members who wished to hear an address on the Queenston Chippawa Power Development, by A. C. D. Blanchard, M.E.I.C., field engineer on the above development. There were about 125 present and about as many turned away. The meeting was open to the public.

Ottawa Branch

F. C. C. Lynch, Associate E.I.C., Secretary-Treasurer.

Meeting of C.I.M.M.

The 24th Annual Meeting of the Canadian Institute of Mining and Metallurgy was held in Ottawa from March 1st-4th.

The Institute very kindly extended a special invitation to the members of the Ottawa Branch of *The Engineering Institute* to attend Dr. Harvie's Address and the excursion to the mine of the Kingdon Mining and Slmeting Company at Galetta, which was much appreciated.

As many members of *The Engineering Institute* are also members of the Canadian Institute of Mining and Metallurgy a short synopsis of the Annual Meeting might be of interest.

The presidential address of Dr. Corless emphasized the importance of mining to civilization, and referred to Canada's pre-Cambrian area, only a portion of which had been scientifically prospected.

All the papers presented were of a high standard and several of them included motion pictures, such as the descriptions of the Hollinger and McIntyre gold mines. The paper presented by Prof. Haultain, on "Ball Mills," was illustrated by a moving picture taken by an ultra speed camera.

Of special interest was Dr. Adam Shortt's paper on the "Economic Relations of Canadian Gold Production," as also the subject of the "Relationships of the Mining Industry to the Canadian Railway Problem," in which Chas. Camsell, deputy minister of mines, pointed out the importance of mining in relation to the railways,

owing to the high proportion of the total railway tonnage contributed by the raw products of the mines, amounting in 1919 to over thirty-five per cent.

E. L. Bruce, presented a very interesting paper on the "Possibility of the Use of Seaplanes in Preliminary Prospecting and Geological Work," pointing out that from the air it is possible to tell various areas by their colour and by the general surface features that are characteristic of sections of country underlain by different types of rock.

Space will not permit of individual mention of the many other papers of equal merit.

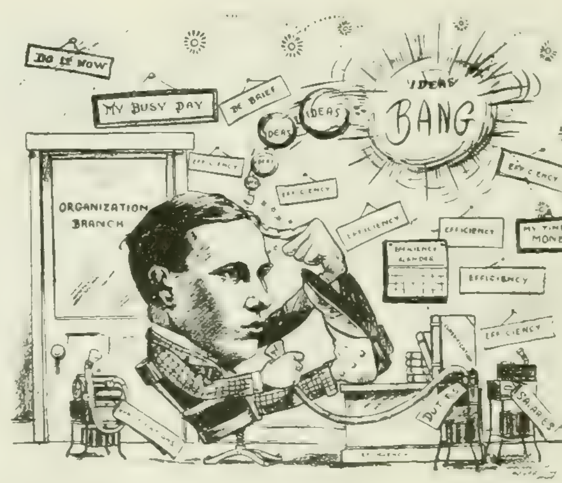
The excursions consisted of a visit to the refinery of the British America Nickel Corporation at Deschenes, Que., in which over a hundred members and visitors participated; and to the Kingdon Mining, Smelting & Manufacturing Co's mine and plant at Galetta, Ont.

Other trips were arranged in the vicinity, including those to the Royal Mint, Parliament buildings, and the Department of Mines testing plants as well as to some of the industrial plants in Hull.

Canadian Water-powers

Development of water-power and progress in construction upon Canadian rivers and streams are constantly making greater demands for hydrometric data. The growth of such studies during the past 17 years was the subject of a very interesting address by Sidney B. Johnson, M.E.I.C., senior assistant engineer of the Department of Public Works, at an evening meeting of the Ottawa Branch on February 23, held at the University Club. A very large number of interested listeners were present, and hearty appreciation of the address was shown. Mr. Johnson said that as a result of the investigations of the past fifteen years it was now possible to estimate closely the available power of practically all of the falls and rapids of any importance on the streams and rivers flowing into the Great Lakes and the St. Lawrence river, and on the latter itself. A discussion of the paper followed being taken part in by Messrs, S. G. Dawson, A.M.E.I.C., Reclamation Branch; D. W. McLachlan, M.E.I.C., Department of Railways and Canals; C. G. Cline, A.M. E.I.C., Dominion Water Power Branch; F. H. Peters, M.E.I.C., Department of the Interior; and D. W. Bell Dawson, M.E.I.C., Tidal Survey. A number of out-of-town visitors were in attendance, among them J. L. Busfield, A.M.E.I.C., Secretary of the Montreal Branch and member of the Walter J. Francis Company, consulting engineers, who made the trip specially to hear the paper; E. C. Goodspeed, M.E.I.C., St. John, N.B.; D. O. Lewis, M.E.I.C., Vancouver; and J. A. Jameson, M.E.I.C., Montreal. The Chairman of the Ottawa Branch. K. M. Cameron, M.E.I.C., presided.

Resourcefulness when put to the test is one of the qualifications of the successful engineer. Such was demonstrated at a luncheon of the Ottawa Branch on the 16th instant, when each of the past chairmen of the Branch was called upon to tell a story or spin a yarn. The plan developed an extremely enjoyable meeting, and the ten speakers, who were each given three minutes, competed for a prize offered by the present chairman K. M. Cameron. Of the past chairmen of the



C. V. PUTMAN — Always on the job.

Branch since 1909 only three were unable to attend, Messrs. W.J. Stewart (1910), M.E.I.C., S. J. Chapleau, M.E.I.C., (1912), and G. A. Mountain. M.E.I.C., (1914), The following were the speakers at the meeting and the years when they were in the executive position; C. R. Coutlee, M.E.I.C., 1909, A. A. Dion, M.E.I.C., 1911; R. F. Uniacke, M.E.I.C., 1913; A. St. Laurent, M.E.I.C., 1915; J. Murphy, M.E.I.C., 1916; A. Gray, M.E.I.C., 1917; G. Gordon Gale, M.E.I.C., 1918; R. de B. Corriveau, M.E.I.C., 1919; G. B. Dodge, M.E.I.C., 1920; and Commander C. P. Edwards, M.E.I.C., 1921. Each speaker had a good story to tell, and the honours being about even the chairman presented each with a prize, consisting of a homely clay pipe, tobacco, matches, etc. Each was also in turn adorned with a chaplet of laurel leaves.

C. R. Coutlee who was introduced by the chairman as an "esteemed" member, remarked amid laughter that it was the first time he knew he was run by steam. He told a good story of a surveyor who was caught with plans in a court case that had been wrongly drawn, but who claimed that his ground was all right. A. A. Dion's story had to do with a motoring experience in which he actually killed a poodle, much to the distress of its lady owner, who, when he tried to offer comfort by a promise to replace the dog, was told: "Sir, you flatter yourself."

R. F. Uniacke, M.E.I.C., scored with a yarn about the surveyors whose work was so accurately done that they successfully drove their rods through the center hole of a buried grindstone, which had been used as a bench-mark.

A. St. Laurent, M.E.I.C., showed how the antipathy of a certain town council was changed to admiration for his work by the judicious provision of refreshments and sandwiches and something "of a kind not easily obtained now in Ontario," John Murphy, M.E.I.C., was good with stories of early telephone trials, when there were no facilities for "ring off", and A. Gray with one of a sectionman who left his work early to go home and on arrival found his wife sitting on the roadmaster's knee. He beat it back to work telling his colleagues that he was "nearly caught."

G. Gordon Gale, M.E.I.C., made a hit with a war story of the "mule skinners," but as a Rotarian, and with an eye to the Rotary wheel, he closed by remarking amid laughter that he would "rather be an extra spoke than another tire."

R. de B. Corriveau, M.E.I.C., told of his late chief, J. W. Fraser, and his early triumphs with certain concrete work, while G. B. Dodge gave particulars of the proposed changes in the calendar and their likely effect on some aspects of engineering.

C. P. EDWARDS—Minus his usual cheerful smile.

Commander Edwards told several stories, and in particular how the Fanning Island cable came to be cut by the Germans during the war through the fact of hidden equipment being disclosed in a copy of a wireless message thrown in a waste paper basket and discovered by the Germans.

There was a large attendance at the luncheon, which included A. W. Campbell, M.E.I.C., Fred. D. Burpee and others as guests.

Local News

Had Rudyard Kipling been present at the last meeting of the executive committee of the Ottawa Branch, he would mentally have repeated the couplet of his famous poem:

"But there is neither East nor West, Border nor
Breed, nor Birth,
When two strong men stand face to face, though
they come from the ends of the earth!"

At the table, with the members of the local committee were seated C. E. W. Dodwell, M.E.I.C., Chairman of the Halifax Branch, *Engineering Institute of Canada*, and President of the Association of Professional Engineers of the Province of Nova Scotia; and D. O. Lewis, M.E.I.C., of Vancouver, as guests. It seemed fitting that these men had been brought together at the capital of Canada, over a transcontinental railway which represent the solution of some of the greatest engineering problems ever undertaken. Mr. Lewis was a member of a deputation from British Columbia which was laying the particular claims of that province before the Railway Commission for readjustment of freight rates. The executive was very glad to welcome the two gentlemen to Ottawa.

The Council of Geodesy and Geophysics is to meet in Rome, Italy, on May 2, and from all indications a record attendance is expected. The Council is divided into two Unions, namely; the Union of Geodesy and Geophysics, and the Astronomical Union. Dr. E. Deville, Chairman, of the Canadian Committee of Geodesy and Geophysics, and Dr. Otto Klotz, Chairman of the Canadian Astronomical Committee, will be the delegates of Canada to the meeting.

Montreal Branch

J. L. Busfield, A.M.E.I.C., Secretary-Treasurer.

"Accident Prevention in Industrial Plants".

On Thursday evening, Feb. 23rd, an address on the above subject was given by W. G. H. Cam, A.M.E.I.C., The speaker set forth that the evolution of machine power for the cheap production of universally distributed commodities had been obtained at the cost of concurrent dis-service to society. During recent years there had been a definite effort to combat these conditions and in this accident prevention was one of the best moves towards solution. In the concrete industry, records showed that fifty percent of the fatal accidents and a large proportion of other accidents were due to the workmen themselves To prevent this, useful opportunity was afforded the Safety Engineer working through committees and educational litterature for the prevention of accident. There was a large attendance and the meeting was presided over by A. C. Tagge, M.E.I.C., Chairman of the Industrial Section of the Branch.

"Inductive Interference".

On Thursday evening, March 2nd, C. V. Christie, A.M.E.I.C., assistant professor of the Department of Electrical Engineering of McGill University read a paper on "Inductive Interference", P. S. Gregory, A.M.E.I.C., Chairman of the Electrical Section, presided at this meeting.

Presentation of Medals

Preceding the presentation of Prof. Christie's paper, Walter J. Francis, M.E.I.C., as senior vice-president of *The Institute* was called upon to make the presentation of the Gzowski, Plummer and Leonard Medals. In presenting the medals, Mr. Francis explained that *The Institute* was now presenting, in addition to the five students' prizes of $25 each, three gold medals, known as the Gzowski, Leonard and Plummer medals.

The Gzowski medal was founded by Colonel Sir Casimir S. Gzowski, one of the first presidents of the Canadian Society of Civil Engineers, 32 years ago, since when the list of recipients, year by year, included many of the outstanding members of the profession who had contributed papers of unusual merit.

This medal was originally of silver, but it had now been changed to a smaller design in gold. Mr. Francis explained that the three medals had now been standardized in size and design, the Gzowski being circular, the

Leonard having the irregular form of an ancient coin, while the Plummer medal was octagonal in form. The two latter had been designed by Frederick B. Brown, M.E.I.C. The obverse of the medals in each case bore the emblem of *The Institute*, a working beaver on a shield, together with the name of the medal: the reverse in each case outlined the scope of the subjects for which the awards were made.

The Gzowski medal was given in the field of civil engineering; the Leonard medal, the gift of Lieut.-Col. R. W. Leonard, of St. Catharines, Ont., past president of *The Institute*, for mining subjects; while the Plummer medal, donated by J. H. Plummer, was for papers in metallurgy and chemistry. The Leonard medal was open to members of *The Engineering Institute of Canada* and of the Canadian Institute of Mining and Metallurgy; but both of the others were restricted to the members of *The Engineering Institute of Canada.*

The Gzowski medal presented to P. Ackerman, A.M. E.I.C., was awarded in recognition of the merit of his paper entitled, "Relay Protective Features of the Toronto Transmission and Distribution Systems". Mr. Ackerman was a graduate of the Swiss Federal Polytechnical College, Zurich, Switzerland, and at the present time is in a high position in the engineering department of the Shawinigan Water and Power Company.

The Plummer medal awarded to Dr. Alfred Stansfield. M.E.I.C., was in recognition of his paper on "Recent Advances in Metallurgy", a very able and comprehensive resume of recent work in the metallurgical field. Dr. Stansfield was a well-known Montrealer, a graduate of London University and for many years professor of Metallurgy at McGill University.

The presentation of the Leonard medal was unique, inasmuch as it was presented to Lieut.-Col. Leonard, by *The Institute*, as the first medal struck from the dies. It was further unique in the fact that the gold from which it was made was practically pure, and was sent by Lieut.-Col. Leonard for the purpose. It was obtained from the refining processes at the Coniagas Mines of which he was the president. The regular award of this medal had not yet been made, but competitive papers were now being considered by the committee.

P. J. Ackerman was presented with the Gzowski medal amidst applause. In a brief reply he said that he had written his paper from a purely engineering standpoint, thinking it would be of very limited interest, and it was a most agreeable surprise to him to learn that it had been considered of such general interest to the engineering profession at large as to be worthy of such a prize.

In the absence of Dr. Alfred Stansfield, of McGill, the Plummer medal was received on his behalf by J. A. Sproule, A.M.E.I.C., who expressed Dr. Stansfield's thanks, with regrets that he had been compelled to attend the meeting of the Canadian Institute of Mining and Metallurgy at Ottawa, which prevented him being present to receive a highly prized honour, the more so as it expressed an appreciation of the work of the mining metallurgists.

The Coniagas gold Leonard medal was also presented in absentia, Lieut.-Col. R. W. Leonard being at present with the C.M.A. party in the West Indies, and was received by Councillor George R. McLeod, who made a brief response on behalf of Lieut.-Col. Leonard.

The Ruins of Babylon

Delving around among record of anywhere from five to seven thousand years ago, with concrete illustrations of cuneiform bricks made at a time when stenographers perpetrated their notes with hammer and chisel, Prof. R. A. MacLean, of McGill University, gave an interesting historical address to the Branch at the regular meeting on Thursday, March 9th.

Dr. MacLean's address was largely concerned with affairs in Babylon and Mesopotamia at a time six or seven thousand years ago, when modern conveniences were not considered. As an instance of this, he showed two samples of Babylonian baked bricks, on which were stenographic reports, nicely chiselled in hieroglyphic style. They were picturesque in their general effects, but undecipherable to the ordinary person of the present age.

Proceeding with his address, Professor MacLean showed the gradual transition from the civilization of the Babylonians, down to the recent periods when the British Expeditionary Forces took charge. This was a very long jump, as was shown by the efforts of the British forces in Mesopotamia to keep in touch with the ancient ideas of the inhabitants and to bring them in line with modern ideas.

Prof. MacLean's address was illustrated with a number of lantern slides, showing the details of the plans of ancient Babylon, with the engineering ideas they worked on.

A vote of thanks was moved by R. A. Ross, M.E.I.C., who pointed out the achievements of the ancient engineers as applied to the work of the engineers of to-day.

The meeting was presided over by Walter J. Francis, M.E.I.C.

Luncheon Meeting

On Thursday, March 16th, the second of the monthly luncheons was held and following the former practice a member of one of the sister professions was invited as the guest of honour.

On this occasion Rev. Dr. R. W. Dickie, president of the Protestant School Board of Montreal and Chairman of the Montreal Branch of the Toronto Alumni Association, addressed the meeting after the luncheon, which was held in the Mezzanine Dining Room of the C.P.R. Windsor station. The problems of society today, said Dr. Dickie, were principally questions of character. The principal role of the Church was to solve these problems of character and the speaker could conceive of no better or more effective way of solving these problems than by inculcating in the rising generation some form of sound, simple, spiritual faith.

Scientific Research in Canada

On Thursday evening, March 16th, Col. F. M. Gaudet, M.E.I.C., technical executive officer of the Honorary Technical Council for Scientific and Industrial Research, gave an address on "Scientific Industrial

Research in Canada" dealing particularly with the work of the Research Council. He emphasized that the application of science to our industries would reduce the cost of living and taxation.

The speaker said, that "A consequence of the war is that we have to raise money by mortgaging the future production of the country, and we are now paying as interest on this mortgage considerably more than the entire national expenditure before the war. The mortgage although expressed in money and measured in dollars must be paid in kind, and production must therefore be efficient, not only to enable buyers to buy, but also to provide means out of which the country will pay its debt.

For a country that is paying its way conveniently, the extent to which it seeks to improve its position may be optional; to a country that can depend at least on earning its living through its natural resources, the added security that can be had by scientific help, may safely be dispensed with, at some sacrifice of luxury; but, for a country situated as Canada is, to dispense with any practicable advance in the search of scientific assistance is sheer improvidence and recklessness."

Numerous examples were mentioned in which science had yielded handsome profits, and Col. Gaudet concluded by appealing to the members for their support in urging the Government to grant the request of the Research Council for the establishment of a National Research Institute in which science will co-operate with agriculture, industry and finance to increase the prosperity of Canada.

Following the paper a resolution was proposed by Fred. B. Brown, M.E.I.C., seconded by Prof. Chas. M. McKergow, M.E.I.C., and unanimously carried that the Montreal Branch of *The Institute* heartily endorsed the proposals of the Research Council for the establishment of a National Research Institute. The Secretary was instructed to send a copy of the resolution to the Premier and also to communicate with the local members of Parliament requesting them to support the establishment of the Research Institute.

Quebec Branch

Hector Cimon, A.M.E.I.C., Secretary-Treasurer.

Contracts and Specifications

T. E. Rousseau, A.M.E.I.C., was the lecturer at the regular meeting of this Branch which was held in the "Green Room" of the Chateau Frontenac, on Monday evening, the 27th of February.

Dealing with "Contracts and Specifications", Mr. Rousseau said that, under this heading, the engineer could find ample opportunity for exercising his technical knowledge and practical experience. Whether he be in private practice, in a corporation or in government service, his work would consist chiefly in preparing specifications and drafting contracts. He would also have to supervise the erection of the works specified and make sure that the contractor fulfills all the conditions set forth in the contract.

Specifications are a detailed statement of all the works to be executed and a true description of the materials to enter the construction of such works. Mr. Rousseau extensively discussed various cases which often occur in practice and enumerated the principal qualities which specifications should always embody, stating that engineers, besides making their specifications as technically perfect as possible, should make it an essential point that they be *fair* to the contractor.

With reference to contracts, by which it is made possible to demand legally that the contractor carry out the specifications, it may be said that they are of three kinds: — lump sum, unit prices and cost-plus. Mr. Rousseau stated that the contract at unit prices was to his mind, of all the forms of contract, the one which most recommends itself to the engineer, being just and equitable to all parties concerned.

In concluding, the speaker said that the engineer had much to gain by great care being used in the presentation of his specifications. He would have the satisfaction of seeing that his specifications would be followed to the letter to advantage by the contractor and that economy in construction and efficiency would result, which are assuredly the principal aims in the work of an engineer.

Following that very able lecture, a most interesting discussion took place regarding certain points brought out by the speaker. Messrs I. E. Vallée, Alex. Fraser, Z. Langlais, J. E. Gibault, O. H. Côté, Art. Fournier, A. R. Décary expressed their views on the matter, and, finally, the Chairman, Mr. Décary, thanked the lecturer and congratulated him on the most successful manner with which he had presented his paper and the fine and clean discussion which he had raised.

Fraser S. Keith's visit

Members attending our meeting of February 27th, had the pleasure of meeting the general Secretary, Mr. Keith, who was good enough to accept the invitation of this Branch and came to Quebec for the express purpose of addressing our members on Society affairs.

This first visit of *The Institute's* Secretary to the Quebec Branch was very much appreciated and, no doubt, Mr. Keith has made quite a number of new friends in the Old City.

After being introduced by Chairman A. R. Décary, M.E.I.C., who expressed the feelings of all in cordially welcoming the Secretary, Mr. Keith said that he was delighted to be among the members of this Branch and that he was very pleased indeed with the good work which is being done here. He then delivered a talk reviewing the activities of *The Institute* for five years, outlining the present situation, making clear the advantages for engineers in being members of our *Institute,*— a unique representative body of the profession in this country,— and stating some of the achievements which are expected to be worked out in the future for the welfare of our members.

A vote of thanks was then moved to the General Secretary by Messrs. J. E. Gibault, A.M.E.I.C., and S. L. deCarteret, A.M.E.I.C., for his most interesting address, the good news he had brought from headquarters and the very kind words he had said about our Branch:— cheerfully carried.

Bringing the meeting to a close, Chairman A. R. Décary asked Mr. Keith to give the Council of *The Institute* the compliments of the Quebec Branch, and to assure them of our most faithful co-operation.

Technical Training for Skilled Labourers

Technical education, its history, its advantages and its possibilities formed the main theme of an elaborate address delivered by J. A. Buteau, A.M.E.I.C., professor at the Quebec Technical School, at the luncheon held by this Branch on Monday, March 13th, at the Chateau Frontenac.

Mayor Samson was the guest of the Branch and also addressed the meeting, expressing his satisfaction, as the Mayor of Quebec, to note the good spirit which exists among engineers as in other professional bodies and business-men clubs in the City of Quebec. Meetings like this one, he said, are the very thing to develop ideas or to bring out before the public facts which may lead to important improvements of wide application in our civic, social or even national activities. Referring to technical education, Mayor Samson said that real experts in all trades are still badly needed in this country; one must pay to learn something and, when we do not pay to get the proper training in schools, we find too often that experience is a teacher that makes us pay very dear, indeed, for its practical lessons; the technical schools of this province are the best means of securing or preparing the trained workmen and technicians upon the shoulders of whom will largely rest the industrial development of our province and of our city.

This form of specialized education, Mr. Buteau said, was first instituted in France in 1870, European universities taking it up almost immediately until, in 1878, the system was started in England, finally becoming the vogue in the United States and Canada. The system was first started in Canada in 1900, the Ottawa Chamber of Commerce inaugurating the policy. In time, it was taken up by practically every Chamber of Commerce in the Country, the Canadian Manufacturers' Association finally putting the seal of its approval upon it. The first technical school opened in this province was inaugurated in Montreal in 1911. To-day, there are such schools all over the province. The training is both manual and theoretic and is offered to pupils of primary grades of the age of fourteen; it lasts three years and equips the graduates with full theoretical and practical knowledge of mechanics, foundry work, joining and modelling.

The speaker concluded by reminding his audience that the technical education of the youth of this country is one of the most potent means of offsetting the present industrial unrest.

A. B. Normandin, Esq., A.M.E.I.C., added a few words on the subject and moved a hearty vote of thanks to the speaker of the day, which was carried with great applauses.

J. E. Gibault, Esq., A.M.E.I.C., who had presided at the meeting in a very able manner, again thanked Mayor Samson for his kind acceptance of the invitation of this Branch and for the most practical way in which he had been good enough to address the meeting.

Municipal Management

A joint meeting of this Branch of *The Engineering Institute of Canada* and of la Société des Arts, Sciences et Lettres de Québec was held at the City Hall on Tuesday evening, March 14th.

The meeting was presided over jointly by Messrs A. E. Doucet, M.E.I.C., for this Branch and G. C. Piché, A.M.E.I.C., for la Société A. S. et L.

The speaker was Henri Ortiz, C.E., manager of the Town of Grand'Mère, who was introduced by Mr. Doucet.

After making known the history of the system of municipal administration by a manager, which only dates back to 1907 and was inaugurated at Staunton, in the United States, Mr. Ortiz stated that 254 cities or towns had adopted this system in the United States and Canada. He then made the comparison between the various systems now in use and clearly presented the advantages of the new and business-like method, which he strongly advocated. Finally, the speaker gave account of the results obtained at Grand'Mère with the new system which replaced the ordinary "City Council" method only two years ago.

A number of lantern slides illustrating the many modern features of the Town of Grand'Mère were next thrown on the screen and proved to be quite interesting.

G. C. Piché then said that he was sure to meet the approval of all present in telling Mr. Ortiz how his lecture had been enjoyed by all and how thankful to him were the members of the two societies whom he so well entertained.

St. John Branch.

Harry F. Bennett, A.M.E.I.C., Secretary-Treasurer.

C. McN. Steeves, M.E.I.C., was the speaker at the regular meeting of the Branch on Thursday, Feb. 16th. The subject of his paper was "The Sub-structure of the International Bridge at Edmundston, N.B."

The international boundary between New Brunswick and the state of Maine follows the Upper St. John River for a considerable distance. The nearest bridge crossing to Edmundston was at St. Leonards, about 26 miles south. Edmundston, with a population of about 5,000, is the large trading centre for the country on both sides of the river, and this bridge has been built at this point to serve the adjacent communities as well as to connect the splendid highways on each side. The river is 850 feet wide at high water level.

The bridge is carried on three piers and two abutments the tops of the piers being generally 58 feet 5 inches above low water summer level. The height of the bridge was necessitated by the crossing of the Temiscouata and Transcontinental Railway tracks on the Canadian side.

No extraordinary difficulties were encountered in the construction, the interesting features being the stiffness of the excavated materials in the pier footings which had to be picked out by hand after a crib protection wall and coffer dam had been placed; and the use of a pontoon bridge for carrying construction materials from shore to the piers. This was used in preference to a trestle as the headwaters of the river held a large quantity of logs awaiting a rise in water to facilitate driving, and an extra

high rise in water would not affect the pontoon bridge. When the logs did come down the pontoon bridge was found to be ideal and no inconvenience resulted either to the contractors or the lumbermen.

The piers are generally 68 feet high and rest on hard pan. River sand and gravel were used in the concrete and after several tests had been made, a temporary screening plant was dispensed with and the natural run of bank gravel used.

The sub-structure was built by D. C. Burpee and Son, of Devon, N.B., with whom Mr. Steeves is associated. The superstructure is being placed at the present time.

Visit to Power House

An opportunity was afforded the members of the Branch to visit the power house of the N.B. Power Co. at St. John on Saturday Feb. 18th. The party was taken through the plant by H. A. Brown, chief engineer of the company, and J. D. Garey, engineer in charge of the power house.

The March meeting of the Branch was held on Thursday, March 16th, when D. L. Hutchinson, "affiliate of the Branch", Director of the local Meteorological Observatory, addressed the members on "Winds and Weather".

After dealing with the technical side of the Meteorological Department and explaining the collection of the weather information and the preparation of forecasts, Mr. Hutchinson talked interestingly of the various popular modes of predicting weather. He scouted the idea that Indians, birds, or animals had any instinctive knowledge of weather forecasting or that the moon in its different phases had any influence on weather conditions.

While the popular opinion, among outsiders, was that the Bay of Fundy was the home of fogs, Mr. Hutchinson explained that they are produced by warm, moist currents of air from the Gulf Stream flowing over the colder surfaces of the sea in more northern latitudes. With a southerly wind prevailing outside, these fog banks drift towards our shore and remain while the wind is from a southerly quarter. With a high barometer at Bermuda and a low pressure area moving slowly through the St. Lawrence Valley, fogs may be expected in the Bay of Fundy.

As examples of intensive rainfall in St. John, Mr. Hutchinson stated that in Jule 1901, 4.32 inches of rain fell in ten hours, and during October 1900, 8.33 inches fell in 68 hours.

The paper was splendidly illustrated by lantern slides among them being an etching of the first steam fog alarm whistle in the world, designed by Robert Foulis, C.E., in 1854, and erected on Partridge Island, St. John, in 1859.

At the conclusion of the address a vote of thanks to the speaker was moved by H. F. Bennett and seconded by G. H. Waring.

The Association of Professional Engineers of New Brunswick has announced the reduction in annual dues from $10.00 to $7.00.

Moncton Branch

M. J. Murphy, A.M.E.I.C., Secretary-Treasurer.

A Supper Meeting of Moncton Branch was held in the Palm Room of the Brunswick Hotel on Thursday evening, February 2nd. J. D. McBeath, M.E.I.C., Chairman, presided.

It was brought to the notice of the meeting that honours had recently been bestowed on three gentlemen holding executive offices in the Moncton Branch, viz., A. F. Stewart, M.E.I.C., chief engineer, Canadian National Railways, Eastern Lines, had been elected to the Council of *The Institute;* S. B. Wass, A.M.E.I.C., construction engineer, Canadian National Railways, Eastern Lines, had been elected President of the Association of Professional Engineers of the Province of New Brunswick; and J. D. McBeath, M.E.I.C., asst. city engineer, of the City of Moncton, had been elected to the Council of the Association of Professional Engineers of N.B.

Town Planning

H. B. Pickings, A.M.E.I.C., of the firm of Pickings and Rowlings, Halifax, gave a very interesting and instructive address on town planning. Mr. Pickings at the outset of his paper quoted Charles Mulford Robinson, who in his introduction to "City Planning" says: "Town Planning includes three operations. The term is applied to the replanning of existing cities and towns, the planning of new towns and scientific plotting of new sections of existing towns. The benefits that are sought by it are, in their turn, speaking broadly, three in number. They are an improvement in those circulatory conditions created by indirect streets and congested traffic, the betterment of social conditions in many directions—notably in that of housing, and an increase in the visible beauty and splendor of cities. Under these headings, gains are anticipated in economy, efficiency, health, comfort and looks."

Mr. Pickings said in part: Town Planning is fundamentally an engineering problem. By this I do not mean to assert that all engineers should be primarily town planners, or that town planning cannot or should not be undertaken by other than engineers. I do say however that town planning from its inception, is an undertaking that required constant engineering in both design and supervising.

The fundamentals of town planning are street planning, subdivisions, building restrictions, park and recreation facilities and districting or zoning. Their relation to each other is so close that town planning fails when any one of them is not given its true place in the whole.

Streets—Whether the development be rural or urban, streets form the framework upon which the village, town or ultimate city will develop. Town planning is primarily planning for the future, so in dealing with the street problem I do so from the city standpoint. As the city is complex and varied in its life so must its streets be. We have first our main traffic streets which may be few or many in number depending on the size of the city. They as the name implies, form the main arteries of the community, provide the means of getting into and out of the

city and are the channels through which it is possible to get from one section to the other. Some are wholly, others partially and the majority likely to become business streets.

The real value of the Town Planning scheme and that by which it will be finally judged might be said to be found in its regulations, governing erection of buildings and the control of the development of the various sections of the city and known as districting or zoning regulations. Building restrictions govern the set back by application of building lines, the height of the building, the proportion of the lot they cover and their class. Districting or zoning regulations designate and govern the area in which these restrictions shall apply and limit the number of dwellings to be erected to the acre. Set back or building lines are intended to achieve two purposes, the first to enable future street widening at a minimum cost and disturbance and secondly to preserve alignment by requirement of a minimum space between the fronts of buildings. Height regulations are a guarantee that a property owner cannot overshadow his neighbour by the erect on of towering structures and thereby rob him of his proportion of light and air. Districting or zoning regulations require that manufacturing plants will not encroach upon retail business or residential areas and they designate the areas in which apartment houses, flats or group dwellings may or may not be erected and govern the density of population.

There are few cities adequately provided with parks and recreation areas. These areas may be classified as wild parks, semi-cultured parks, public gardens, play grounds, open spaces or squares and athletic grounds. I do not know of any other adequate basis by which to suggest what proportion of a city should be reserved for areas of this character.

Mr. Pickings paper was followed with very keen interest, and it was very much appreciated by members of the Branch.

J. D. McBeath, M.E.I.C., on tendering a vote of thanks to Mr. Pickings spoke briefly on the advantages that town planning was to every city if carried out properly.

During the evening Mrs. Harold Price sang beautifully "Sweet Early Violet" and for the encore rendered "The Sweetest Flower that Blows". Mr. Elliott also rendered a solo in a very pleasing manner. W. A. McKee was the accompanist.

Halifax Branch

O. S. Cox, A.M.E.I.C., Secretary-Treasurer.

A Lump of Coal

The regular monthly meeting of the Branch was held in the Nova Scotia Technical College at 8 P.M., Feb. 16th. Owing to the extreme inclemency of the weather the attendance was small, which was especially unfortunate as a very valuable paper was presented by K. L. Dawson, A.M.E.I.C., on "A Lump of Coal." The following are some extracts from Mr. Dawson's paper:—

Coal finds its place in our economic scheme because nature does not create and destroy indiscriminately. The variety of its constituents and the complexity of their composition cause extreme difficulty in their isolation even by those who are most skilful in laboratory operations.

The combustion of raw coal is wasteful because it is impossible to control the reactions which precede and accompany the decomposition of the coal substance. Especially is this true for its use in stoves and small furnaces. From the standpoint of the conservation of our national resources such use of coal is condemnable. Modern improvements give large efficiencies to boiler and furnace yet there is a very great discrepancy between the amount of useful heat and the amount of potential heat in the original coal, with no by-product except ashes.

The full use of the dense raw coal naturally lies in its transformation into fuels of higher availability such as gas, oils, tar and coke. Commercially this phenomenon is carried on in two high temperature processes, coke oven and gas works practices. The first aims chiefly at Coke, and the other at Gas. In each the other is the chief by-product. Both processes require a certain amount of volatile matter, otherwise the amount of the distillate obtained is inadequate to warrant the cost of operation, or the quality of the residue is so poor that no coherent coke can be isolated. Coals containing 16 to 40 percent can be coked but coke-oven practice demands 18% to 33%. For each process present equipment demands a sulphur content of less than 1¼% but it is very probable that a method will be found for utilizing coals containing more sulphur.

Using as an example the method of distilling coal used by the Nova Scotia Tram and Power Company to produce the gas used in Halifax, the author shewed that the manufacture of gas is not a simple and self-regulating process but one requiring engineering skill in the application of physical and chemical theory to both the design and the operation of equipment. Some recently installed apparatus, developed locally, which washes the gas with oil, removes twenty grains of organic sulphur per hundred cubic feet of gas and permits the use of Nova Scotia coals containing about 2.25% sulphur.

From the distillation of coal there are several main products of which the most important in our present economic scheme are known as gas, coke and tar.

Industrial concerns have already found upwards of 2000 uses for gas in various manufacturing processes and thousands of plants would close if gas-service were suspended. Although gas has practically withdrawn from the lighting field it is false to say that electricity has conquered her.

Probably the chief distinction between coal and coke is the almost entire lack of volatile matter in, and the porous structure of the latter, which qualities enable it to be consumed and converted in a single stage and at a high temperature directly to carbon dioxide. Chemically considered, coke consists of carbon, together with all the mineral constituents contained in the coal from which it is made. It contains only a trace of hydrogen. The amount of carbon varies from 85 to 95% and the ash from 5 to 15%. Fired in furnaces under correct conditions

of balanced draft, the formation of carbon monoxide gas can be largely avoided. Judged by its analysis coke should not have a calorific intensity superior to coal, such as it possesses as evidenced by its use for metal-melting and other high temperature processes.

The explanation probably is that the process of combustion being already far advanced by the heat absorbing process of distillation, less heat is required to gasify it than is necessary in the case of coal. There is also a marked difference in the specific heats of coal and coke. Coke does not have the chilling effect of fresh coal when thrown upon an incandescent fire, and, being almost entirely free from hydrogen, it burns without the formation of water. By using the "sandwich" system for blending coal and coke large quantities of coke are now being consumed with very inferior grades of coal, giving greater efficiencies than can be developed from coal allne, even when burned on chain grates.

Tar, which formerly was a waste product, polluting rivers and ponds, is now a very valuable commodity. It is used to some extent in its original form but finds its most important application in the arts where it forms the basis of aniline colour production, 392 colours and shades being listed as coming from tar. From it we obtain also creosote, carbolic acid, naphthalene, anthracene andben zol, each of which in turn gives rise to a long series of other products.

Considering the number of combinations of different primary products which are possible when they are heated under conditions permitting the temperature and pressure to be independently varied, it is obvious that a great amount of useful work can be done in following up the secondary decompositions. This applies to both coal and tar and particularly lends itself to laboratory methods of investigation.

Is it more important to develop means of utilizing inferior fuels than to develop more efficient means of utilizing the economic good in our best fuels? Whatever arguments may arise in the mind for or against the question, it is a fact that the supply of our best fuels is not unlimited. It is a significant fact that the United States has begun to import oil. New methods of coal and tar distillations will undoubtedly be developed if for no other reason than to produce a fuel for motor vehicles.

Encouragement for the woik of the Advisory Research Council and of individual effort is eminently necessary.

Mr. Dawson's paper was illustrated by a number of interesting lantern slides and a motion picture film.

Air Board Specifications

A list of the Canadian Air Board Specifications for Aircraft Materials and Components has been received from F. C. Higgins, A.M.E.I.C., intelligence officer, the Canadian Air Board, which is complete to January 1922, the information contained in which is available to all members of *The Institute* through the Institute Library. The specifications include: bolts; brass, copper and bronze; dope and ingredients; electrical; fabric; alloys; petrol, oil; steels; tubes; timber, glue; wires, wire ropes; paints and varnishes.

The official listing is given herewith:—

A. Bolts, etc. List No. 2, January 1922.

2 A 1. Bright Steel Bolts and Nuts, B.S.F. Threads.
A 4. Test pieces (Tensile, Bend and Notched Bar).
B. Brass, Copper and Bronze
B 1. High Tensile Copper Alloy Bars.
B 2. Gunmetal Castings.
2 B 4. Copper Sheets (annealed).
2 B 5. Brass Sheets (hard rolled).
B 6. Naval Brass Bars.
B 11. Brass Bars for Brazing or Silver Soldering.
2 B 12. Brass Sheets (annealed).
D. Dope and Ingredients
2 D 1. Methyl Ethyl Ketone.
2 D 6. Cellulose Acetate.
2 D 7. Benzyl Alcohol.
2 D 9. Alcohol.
2 D 10. Benzol.
3 D 12. Triphenyl Phosphate.
D 13. Methyl Acetate.
2 D 15. Distillation Apparatus.
2 D 22. Acetone.
3 D100. Air Ministry Cellulose Acetate Dope.
E. Electrical
3 E 1. High Tension Electric Ignition Cables.
4 E 3. Low Tension Flexible Electric Cords and Cables. Add *.
E 16. Copper-Asbestos Washers for Sparking Plugs.
F. Fabric, etc.
3 F 1. Linen Aeroplane Fabric (Grade 1).
2 F 7. Rubber Tubing.
L. Alloys
L 4. Aluminum Sheets.
P. Petrol, Oil, etc.
P 1. Petrol.
S. Steels
2 S 1. Part 1. Medium Carbon Steel Bars (bright drawn)
2 S 1. Part 2. Medium Carbon Steel Bars (hot rolled)
S 3. Mild Steel Sheets (for welding).
S 21. "20" Carbon Steel Bars.
T. Tubes
T 1. 35-Ton Carbon Steel Tubes.
T 6. Mild Steel Tubes (hard drawn and blued)
3 T 7. Seamless Copper Tubes.
T 10. Schedule of Standard Sizes of Round Steel Tubes.
T 11. Schedule of Standard Sizes of Oval Steel Tubes.
2 T 12. Schedule of Standard Sizes of Steel Tubes of special sections.
T 21. Annealed Carbon Steel Tubes.
T 26. Mild Steel Tubes (half hard or fully softened).
V. Timber, Glue, etc.
2 V 1. Silver Spruce and approved substitutes.
V 2. Casein Cement.
V 3. Plywood.
W. Wires, Wire Ropes, etc.
2 W 1. High Tensile Steel Wire.
2 W 2. Flexible Steel Wire Rope.
X. Paints and Varnishes
2 X 4. White Dope Resisting Paint.
General Clauses dealing with Inspection

NOTE: — * "Add" signifies that an addendum or corigendum slip is issued with these Specifications.

List No. 2 will be amended from time to time to include any new, revised, or superseding Specifications, and should be destroyed upon receipt of the number superseding it.

Town Planning Notes and Comments

Horace L. Seymour, A.M.E.I.C.

NOTE. — *In order to make this column of wide interest to members of The Institute, personals and items of town planning interest will be appreciated. Address: Horace L. Seymour, A.M.E.I.C., 40 Jarvis Street, Toronto.*

Report of Town Planning Committee Toronto Branch

It has become a matter of general belief in *The Engineering Institute of Canada* that the engineer should be a leader in public affairs. In no sphere of community usefulness is the engineer's influence more needed than in that of town planning — this is possibly not a matter of general belief, but it is a truth held strongly by more than one engineer.

The report of the Committee on Town Planning of the Toronto Branch is concerned this year with a review of town planning activity in Ontario, with particular reference to Toronto. The Planning and Development Act grants control to cities, towns and villages in the matter of street location in undeveloped areas within the municipal limits and over an urban zone of several miles in extent surrounding the municipality. The Act does not in any way. however, give control over building development. The municipal and other acts grant certain by-law power to councils of municipalities with respect to building development within the municipality itself, but not in any urban zone. The city of Toronto controls the layout of streets and subdivisions within the city and within the urban zone extending five miles from its boundaries. It can, and does insist, for example, in certain cases, on streets of greater width than the usual 66 feet. All concession and most main travelled roads are being widened as subdivision takes place, but the city has no power outside its own limits to insist before subdivision on buildings being kept back to allow for the projected widening. Taking advantage of the amendments to the Municipal Act passed last year, it is understood that the township of York is preparing by-laws that will prescribe building lines on all those roads or streets in the Toronto urban zone that the city plans to widen. In its private bill it is also understood that the township of York is asking for five percent dedication for parks in all new subdivisions, the intention being to consolidate these small park areas so obtained.

The Planning and Development Act provides for the appointment of a Town Planning Commission. It may be stated in general, that, the city of Toronto being one exception,town planning activity has been greatest where a Town Planning Commission or Committee has been appointed. There might be mentioned the cities or towns of Ottawa, Oshawa, Hamilton, St. Catharines, Kitchener, Waterloo, Guelph, Brantford, Niagara Falls, London and Welland, and the Essex Border Utilities Commission.

Interest in town planning in New Ontario has been stimulated by a recent paper by H. T. Routly, A.M.E.I.C., on "The Development of Townsites in New Ontario". This paper was read before the annual meeting of the Association of Ontario Land Surveyors, last month. Mr. Routly pointed out the evils of haphazard development in the North and he showed that town planning was not something of a fad or something of a luxury, but a stern necessity in the development of the North country. With regard to that country he said that it was one that gave not only an opportunity to the town planner, but from which there was a call of duty to the town planner. It is understood that a committee of surveyors has been formed to devise ways and means for the intelligent control of townsites in Northern Ontario.

The Ontario Town Planning and Housing Conference, composed largely of representatives from various municipalities, recently sent a delegation to wait on the premier. Premier Drury's attention was drawn to the fact that town planning legislation was scattered through various acts, and that in consequence, the average municipality in Ontario did not know its powers. The premier promised consideration in the consolidation or codification of town planning powers and it understood in this connection that a Committee of the House is to be appointed.

There are some seventy-five members of the Town Planning Institute of Canada. Of this number some 30 are engineers. The Toronto Branch has a membership of about thirty, with a regular membership of about half that number. The programme for last season was an excellent one, papers being read by several members of the Toronto Branch of *The Engineering Institute of Canada.*

Since town planning is essentially a matter of economy, it means that sooner or later business organizations will become interested. Many examples of this "commercial urge", both in Canada and the United States might be cited, and in our own city of Toronto the Downtown Association, an organization of business men has been actively interested in town planning. It requested some months ago representation from the various Toronto bodies, technical or otherwise, that were interested in town planning. The Chairman of this Town Planning Committee represented the Toronto Branch of *The Engineering Institute of Canada.* There were also representatives from the Architectural and Town Planning Associations and from the Civic Guild. This latter organization for years has been urging many measures for the betterment of Toronto and has been successful in obtaining valuable legislative powers relating to town planning.

The result of the activity of the Downtown Association has been that the attention of the Mayor and Council has been brought to the necessity of appointing some commission in Toronto to take care of town planning matters, in particular that of street widening and street extensions, and before the year is out it is hoped that some definite action will have been taken.

If the engineer is to lead in public matters, now is the time for him to assist in the town planning movement by using his influence with all those with whom he comes in contact. Education is still needed, not only of the public, but of those elected to deal with public matters.

Let us be inspired by the action of the Sault Ste. Marie Branch of *The Engineering Institute of Canada.* The Secretary reports: "It is our intention to stimulate public interest in the Sault in a city planning movement. Already we have secured the promise of co-operation and support from a number of local public bodies".

Preliminary Notice

of Applications for Admission and for Transfer

March 20th, 1922

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate member a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in April, 1922.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows —

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option, Railway, Municipal, Hydraulic, Mechanical, Mining or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidat. has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years oe age, and must have been engaged in some branch of engineering for at least four years! This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects, Geography, History (that of Canada in particular), Arithmetic, Geometry Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits cientific acquirements, or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

> The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

AKINS—JAMES ROBERT, of Ottawa, Ont. Born at Kinburn, Ont., Sept 2nd, 1876; Educ., B. Sc. Queen's Univ. 1907. D.L.S., A.L.S.; Since graduation [illegible] in various parts of western Canada, chief of party since 1910; 1919 to date chief of party, Topog'l Surveys Branch, Dept., of the Interior, Ottawa, Ont.

References: J. L. Rannie, J. D. Craig, F. M. Dennis, F. V. Seibert, W. C. Way, G. H. Herriot, A. W. Haddow, A. Macphail.

BENNETT—GEORGE ARTHUR, of 561 Gilmour Street, Ottawa, Ont. Born at Eden, Ont., May 18th, 1886; Educ., B.A.Sc. (C.E.), Univ. of Toronto, 1910. D.L.S., A.L.S., 1907, divisional surveying C.P.R.; 1908 articled asst., D.L.S., 1910 asst. on D.L.S. for Dept. of the Interior, and from 1911 to date, chief of party, Topog'l. Surveys Branch, Dept. of the Interior, Ottawa, Ont.

References: G. H. Herriot, G. B. Dodge, P. Gillespie, P. E. Palmer, R. C. Purser, S. D. Fawcett.

BISSON—JOSEPH LEONARD, of Fort William, Ont. Born at Hull, Que. Nov. 24th, 1886; Educ., B.Sc., (C.E.), McGill Univ. 1912; 1902, foreman on constrn. coffer dam and concrete work, Ottawa and Hull Power Co.; 1907, stop logs, Big Chaudiere Dam, Ottawa; 1910 and 1912, supt. on constrn. of coffer dams, laying water mains, extension to city power house, Hull, Que.; 1912-18, asst. engr. and 1918 to date, senior asst. engr., Dept. Public Works, Canada, at Fort William, Ont.

References: H. B. R. Craig, G. H. Burbidge, J. A. Laniel, J. E. St. Laurent, G. R. Duncan.

CHRISTIE—WILLIAM, of Ottawa, Ont., Born at Sullivan Township, Grey Co., Ont., Feb. 13th, 1876; Educ., B.A.Sc., Univ. of Toronto, 1902, D.L.S., S.L.S.; 1903-06, asst., and 1907 to date, chief of party on different govt. surveys. At present, surveyor engineer, Topog'l. Surveys Branch, Dept. of the Interior, Ottawa, Ont.

References: G. H. Herriot. G. H. Blanchet, F. V. Seibert, S. D. Fawcett, A. L. Cumming.

CLARK—HIAL JACKSON, of 64 Bridge Street West, Belleville, Ont. Born at Wellington, Ont., Aug. 21st, 1888; Educ., B.A.Sc., Univ. of Toronto, 1912; 1911 (Summer), asst. and instr'man., to J. W. Fitzgerald, O.L.S.; 1912-13, asst. to J. D. Shapley, S.L.S., A.L.S., D.L.S., North Battleford, Sask.; 1914, dfting office and motor survey of county roads, Ontario Dept. Public Works; 1914-16, instr'man. and res. engr., in charge of constrn. work, Toronto-Hamilton concrete highway; 1916-19, asst. to City Engr., Hamilton; 1919-20, res. engr., Hamilton-London Prov. Highway; 1920-21, supt. of constrn. for Johnson Bros. Highway Contractors, Brantford, Ont.; 1921 to date, asst. and supt. for H. T. Routley, highway contractor and engr., Toronto.

High Frequency Telephone as applied to High Tension Power Stations

Experience of Shawinigan Water and Power Company in applying radio methods to telephony over power circuits.

A. S. Runciman, A.M.E.I.C.

Paper read before Peterborough Branch, The Engineering Institute of Canada, April 20th, 1922.

This is particularly a year in history for wireless telephony because it may be said that this year, or rather this winter, wireless telephones have commenced to cause the return of some of the money spent in the enormous amount of research and development work. The telephone concerts broadcasted every night by the Westinghouse Company, Radio Corporation and Marconi Company, in Canada, have resulted in a sale of enormous quantities of receiving apparatus. It is actually possible to set up in homes in Ontario and Quebec a simple receiving set which will bring in the concerts from Pittsburg and New York not every night but very often during the winter nights. It is not possible to receive a good concert every night as the distance is rather too much for the power of the transmitting sets in use. As the weather becomes warmer, increasing difficulty is always experienced in receiving very distant stations on account of the increased ratio of atmospherics to signal current. However, from the press reports, this has been a great winter for the wireless apparatus manufacturers and retailers.

It may be said that the development of the modern high frequency telephone commenced in 1906 when Dr. Lee DeForest, brought out the vacuum tube device containing three elements. This device has been described in many publications including the A.I.E.E., transactions, also the proceedings of the Institute of Radio Engineers.

The Valve

The Thermionic valve is the foundation of all present day wireless telephone apparatus and it will be described briefly with its adaptation in a present day high frequency telephone.

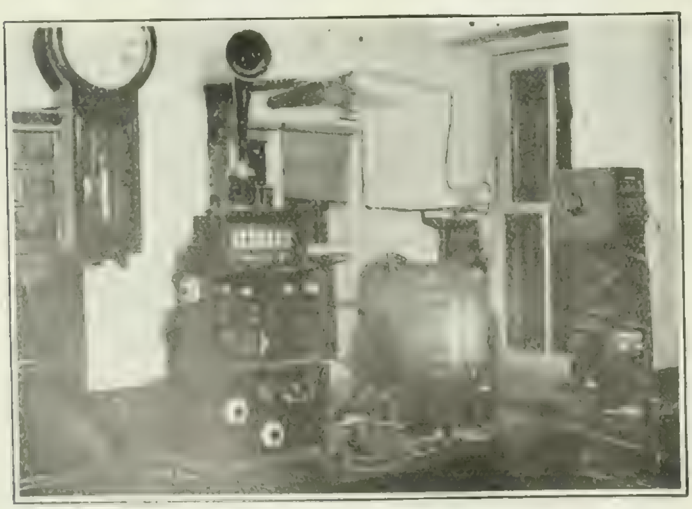
The valve consists of a hot filament or cathode, a fine wire grid control member and the plate or anode in a glass container highly evacuated. The vacuum of a good hard valve is a few ten millionths of a millimetre of mercury so for all practical purposes it is perfect. In order that it may remain a perfect vacuum the parts have all to be treated by heat before sealing to extract any occluded

gases which may be locked up in the metals and which would work out in time.

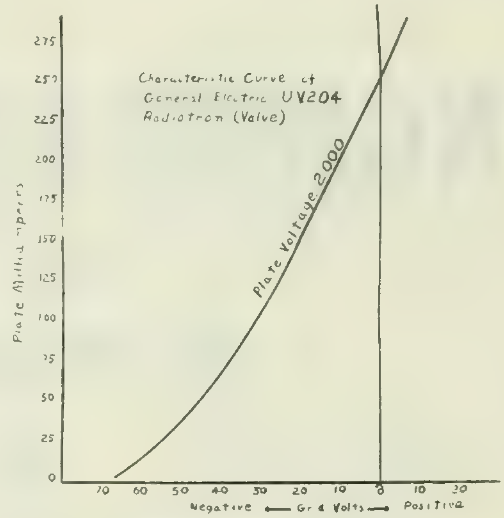
In operation the filament is heated to incandescence (2500°-2700° absolute temp.) with the result that electrons are emitted. This is the Edison effect. A battery connected between this electrode as cathode and the plate as anode produces a convection current of electrons from one to the other. Since negative electricity only is present, current can only flow in one direction, from the plate to the filament. The action so far is the same as the English Fleming valve, which also makes use of the Edison effect, but in the three element vacuum tube an epoch making advance was made in that the third electrode allows us to control the electron current completely without consuming appreciable energy at that electrode or in its circuit. In other words an inappreciable amount of power applied to the third electrode or grid will result in large changes in power in the anode circuit. Moreover since the electrons have no appreciable inertia, the response in the anode circuit to slight variations of power in the grid circuit is practically instantaneous.

To get an idea of the operation of the valve, let us examine a typical characteristic curve. This particular curve, Fig. 1, was plotted for the General Electric Company's 250 watt power valve U.V. 204. The base line represents grid potential with respect to the filament. The vertical represents the corresponding anode current in milliamperes with anode positive 2000 volts to the filament.

Note for instance with 10 volts negative grid potential the current is 205 milliamperes. Now with 30 volts negative grid potential the plate current is reduced to 105 milliamperes which, as the anode voltage remains 2000 volts, means a power reduction of nearly 50%. The power absorbed by the grid is practically nil so we may by a suitable step-up transformer transform voice controlled current to a voltage swing of 20 volts and in this case vary our power through the valve anode by 50%. This is only an example, it is possible by applying 65 volts negative potential to reduce the anode power to practically zero, thus the variation would be 100%.



Shawinigan Water and Power Company's
High Frequency Telephone Set at Shawinigan Falls, Que,



Characteristic Curve for 250-Watt power valve U. V. 204.
Fig. 1.

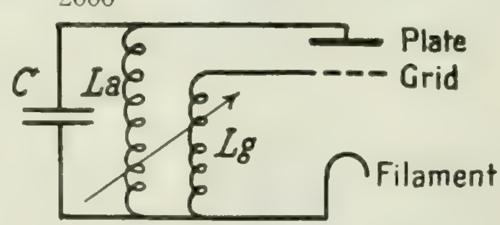
Now if we couple between the grid and filament a valve varying potential we see that the power applied between the anode and hot cathode is varied accordingly. Since the electrons have no appreciable inertia and the response is instantaneous in the power circuit it does not matter what frequency we apply it is faithfully reproduced in the power circuit with amplitude varying according to the amplitude of the source applied to the grid. It is a well known law that any amplifying device may be made to oscillate by merely feeding a small quantity of the amplified power to the control member. Therefore, by means of a feeding back connection we may apply power from the anode circuit to the grid circuit and set up the oscillations at any frequency for which we chose to design a circuit.

$$f \quad (\text{frequency}) = \frac{159{,}200}{\sqrt{L \text{ (microhenries x } C \text{ (microfarads)}}}$$

That is, by choosing capacities and inductances of suitable values we fix the frequency at which our circuit will oscillate.

In order not to be confused by the term "wavelength", it is sufficient to say that the wavelength is the distance between the crests of two adjacent waves. The total number of waves per second multiplied by the wavelength must equal 300,000,000 metres which is the distance a wave travels in one second and is the speed of light.

Thus 2000 metres wavelength is merely another way of saying $\frac{300{,}000{,}000}{2000} = 150{,}000$ cycles



Simple Oscillation Circuit
FIG. 2

Oscillator

The circuit shown in Fig. 2 consists of a three electrode valve, a tuned circuit and a feed back inductance Lg coupled to the tuned circuit inductance. Suppose we wish to design a circuit for 2000 metres or 150,000 cycles we may select either the inductance or capacity. If we select an inductance of 300 microhenries and apply this value to the formulae

$$f = \frac{159.200}{\sqrt{L \text{ (microhenry)} \times C \text{ (microfarad)}}}$$

$$150{,}000 = \frac{159{,}200}{\sqrt{300 \times C}}$$

$$300\,C = \left(\frac{159{,}200}{150{,}000}\right)^2$$

$$C = \frac{\left(\frac{159{,}200}{150{,}000}\right)^2}{300} = \frac{1.125}{300} = 0.00375 \text{ microfarads.}$$

Therefore, with our inductance of 300 microhenries in parallel with a capacity of 0.00375 microfarads and negligible resistance, we have a circuit which will oscillate at 150,000 cycles or a wavelength of 2000 metres.

We assumed a value of 300 microhenries. This inductance is made up of the inductance of coil L_a and mutual inductance of coil L_a with coil L_g. We require one variable factor in order to adjust the frequency to an exact value so either the inductance or the capacity is made variable. In a simple set the capacity C, may represent the aerial in which case it is fixed and must be measured or calculated and the formula above used to calculate the inductance. The inductance L_g as a rule is about the same as, or greater than L_a and made to vary electromagnetically with L_a. The function of L_g as stated before is to feed energy enough back to the control member, the grid, to keep the circuit oscillating. In the case of a valve of low amplification constant L_g will be considerably greater than in the case of a valve of high amplyfing ability.

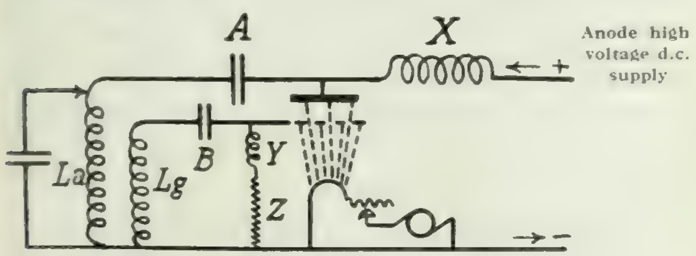
Power Supply

We have made no provision for supplying power to the valve in Fig. 2. A few remarks here with regard to separating a.c. and d.c. circuits will be of value. If the inductance is sufficiently high with regard to the frequency, a.c. will pass through a condenser through and not a choke coil. On the other hand d.c. will pass through a choke coil and is blocked by a condenser. We may, therefore insert choke coils and condensers of values greater than those used in the oscillating circuits and apply d.c. where required and isolate a.c. where we desire it.

In the oscillating circuit we have chosen in Fig. 2, it only remains to fit in the d.c. with regard to utility in the apparatus.

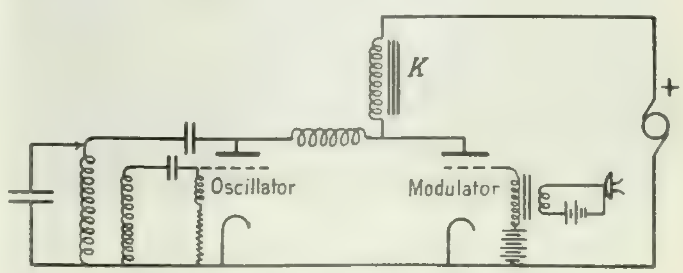
The high frequency a.c. circuit is the same as Fig. 2 with the condenser A. inserted to stop the flow of d.c. through the inductance L_a, thus the only path for the d.c. is through the valve on the electron stream from the filament. Choke coil X stops the high frequency a.c. from backing up into the machine circuit.

Now we come to the grid potential. It will be remembered referring to curve Fig. 1, that in order to limit the anode current we maintain a negative potential on the grid and the more negative the grid the less anode current flows. In order to have a base line or starting point for the varying control potential on the grid we must fix on some value to vary about. In Fig. 1, if we choose to work between 100 and 200 milliamps, the corresponding grid potentials are 30 and 10 volts negative. Therefore, if we hold the base potential at 20 volts negative and allow the control to swing on either side of 20 volts we will have a good average control. In order to hold this 20 volts, we may use a battery usually termed a "C" battery or still better a grid condenser "B" and grid leak resistance Z (Fig. 3). The a.c. passes through the condenser B. and as only negative electricity is emitted from the filament the positive half cycle flows in to the filament. The negative half cycle is trapped on the grid and the grid side of the grid condenser. With the circuit oscillating this negative potential will build up to such a value that the anode current will be reduced to zero. Instead of allowing this a choke Y and a resistance Z are connected between the grid and filament. The function of the choke is to block the a.c. and pass the d.c. negative charge. The negative grid-to-filament current is limited by the resistance Z to such a value that in the case mentioned where 30 volts negative are required there are 30 volts I.R. drop across the resistance. Thus, if we use 5000 ohms resistance, a current of $\frac{30}{5000} = 0.006$ amperes will flow, and the power applied to the control circuit is $0.006 \times 30 = 0.18$ watts.



Method of applying power.

Fig. 3.



Oscillator and Modulator Plate Circuits in parallel divide current through *K*.

FIG. 4

Showing the adaption of the Modulator Valve

Modulation

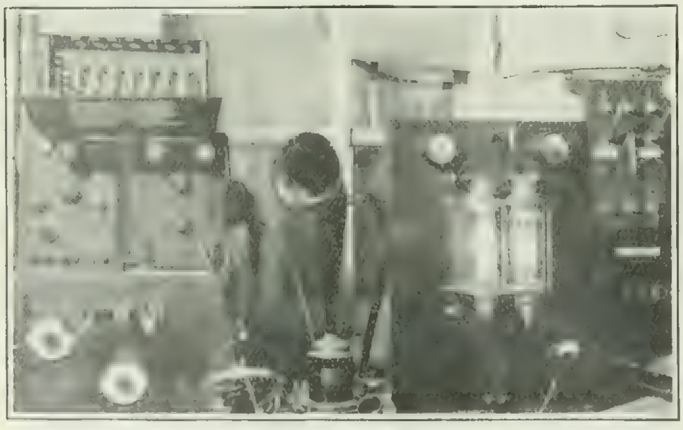
Now it only remains to couple up a modulator valve with an oscillating valve and we obtain modulated high frequency power. The method of coupling the two valves in common use today is known as the choke or constant current method.

The anodes of both valves are supplied through an iron core choke coil of inductance of about two henries. This choke coil serves two purposes, one of smoothing the commutator ripple from the generator and the second that of maintaining a constant current which divides between the two anodes depending on the respective grid potentials. Thus in the example above if the modulator grid potential swings to 40 volts negative it rejects 50 milliamps anode current which is forced over into the oscillator anode and vice versa if the grid swings to only 10 volts negative the modulator draws 200 milliamps and robs the oscillator accordingly, as the choke refuses to allow changes from the source of high voltage supply to take place at voice frequency.

If condenser C represents the radiating antenna then the radiated high frequency varies according to the variation of the potential of the modulator grid by the voice control.

Receiver

The receiver is the same as used for receiving wireless telegraph merely a tuned circuit resonant for the frequency to be received and a rectifier to cut off one half of the high frequency wave. A telephone diaphragm has too much inertia to vibrate at frequencies over 15,000 cycles and the ear would not detect the vibration if it were possible so by lopping off half of the modulated high frequency carrier a pulsating unidirectional current is left which corresponds to the voice control at the transmitting set.



Shawinigan Water and Power Company's High Frequency Telephone Set at Shawinigan Falls, Que.

The Shawinigan Water and Power Company has three sets in use at present located at Montreal, Shawinigan Falls and Victoriaville. The respective distances are 86 miles and 55 miles. The first pair of stations have been operating satisfactorily since December, 1920. There are some features which it was necessary to develop for the company's particular purpose as the apparatus is used by the regular operating staff. One very necessary feature is the call to attract the operator's attention. This was simply arranged by the use of an oscillating receiver slightly out of step with the incoming transmitter carrier wave. The difference between the two high frequencies produces an audible note which is amplified and finally reproduced on loud talking apparatus manufactured by the Magnavox Company. The note can be set at any pitch. It was found after some operating experience that there was some chance of the frequency changing slightly at either one end or the other so in order to produce an audible note a device for swinging the outgoing frequency about one percent was installed on each transmitter. This operates by merely turning a crank such as is used on an ordinary local battery telephone.

The call receiving circuit acts as an indicator of arcing contacts and grounds on any part of the H.T. system. We have been able to trace at least two cases when arcs were on, one in a cable on the distributing company's 12,000 volt system and one an arcing contact in an oil circuit breaker. Of course, these troubles usually show up in other ways but the call receiver attracts the operator's attention as soon as any. The ordinary buzzing noted on all high voltage insulators does not effect the receiver to any extent but arrester charging makes a lot of noise. It is interesting to note the varied strength from the distant arresters.

Another feature is the lightning protection. We operate the telephone through a lightning storm with no more interruptions than during a high wind or snowstorm. A flash of lightning is over in a fraction of a second and the induced noise in the receiver rarely obliterates a spoken word. The aerial circuit is isolated from the set proper by the coupling between the primary and secondary coils. In the circuits shown previously, the condenser representing the aerial capacity is an actual fixed condenser and a separate tuned circuit is coupled to the primary oscillator. In this aerial circuit coil E is variable for tuning the aerial circuit to resonance.

Condenser D has an insulation test of over 15,000 volts. Its purpose is to peak up low frequency surges so that they discharge to ground across the earth gap. High frequency surges or lightning will be opposed by the choking effect of Coil E, and will peak up and discharge to earth over the metal arrester gap. These gaps discharge when station electrolytic arresters are charged or when a severe power surge occurs. Inductance F shunted across the arrester gap drains off d.c. charging in windstorms, also in some cases our aerial is in a high voltage power frequency field due to close proximity of the power lines and this choke ties the aerial to ground potential for the low frequencies while the high frequency is isolated in the aerial.

The receiver used for the regular voice reception as distinguished from the call has a few steps of high frequency amplification. As a rule two or three steps are used. If four or more are used the noise due to the power induction becomes so great that no advantage is gained

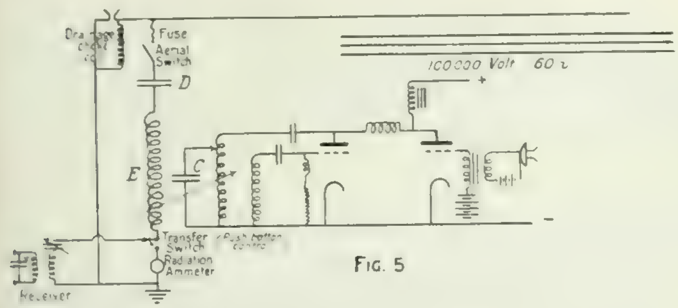


Fig. 5

Showing Adaption of Set to Aerial System and Transmission Line

in quality. The transfer from call receiver to voice receiver is made by merely lifting the head phones from a hook switch. This puts out the call valves and lights the high frequency amplifier valves.

Mention was made of the aerial system. This is radically different from ordinary wireless practice in that the aerial is located in close proximity to the high tension lines.

When tests were commenced everything was done to shield the apparatus and place the aerial where it would be least exposed to the power induction. All tests showed a predominance of induction over signal. Static was barely noticeable as compared with induction.

Wired wireless was put in use for a time by connecting the aerial coil to the centre tap of two condensers in series across the telephone line. These condensers were small capacity and well insulated so did not interfere in any way with the regular telephone operation. High frequency telephone tests were made with the telephone line open in several places and no weakening of signals was detected. As there was some danger of the power wires coming in contact with the regular telephone line a stretch of similar construction to the telephone line was built about 3000 ft. long at each station and functioned quite as well as the telephone line itself with less noise. On account of the length thought necessary to make the exposure to the power wires, the resistance of the aerial is necessarily high and its capacity large for wireless frequencies. An aerial of high resistance requires energy to be applied at a high voltage. Consequently it was found that by using a step-up ratio in the coupling between the set and the aerial inductances and tuning the aerial by means of a small capacity in series the power available in the set could be applied with fair efficiency to the aerial. Where normally in a standard aerial three amperes would oscillate only one ampere would be indicated in the long transmission line aerial, the power taken by the set being the same in each case. The comparative resistance can be worked out from current reachings applied to the I^2R law.

Reception on this type of aerial as stated before was better than over the wired wireless (direct connection to the telephone line). It is unfortunate that actual reception measurements are so difficult to make. The voice received over 87 miles is very much stronger than over any ordinary wire line that long and comparatively free from noise. When the head phones are put on some noise is noted but when the distant set power starts, the majority of the noise disappears or is wiped out by the high frequency carrier, leaving a quiet well modulated circuit infinitely superior to the telephone circuit which parallels the high tension lines.

The present system of operating is simplex, that is, one operator pushes a button and talks, then releases his button and listens. Duplex has been satisfactorily worked by using wavelengths differing by about 25%. This means that on one aerial wire we transmit one ampere at 150,000 cycles and receive a few micro amperes at 190,000 cycles. The only additional apparatus necessary is a rejector circuit between the transmitter and receiver tuned to the transmitter frequency. This offers a high impedance to the local frequency and allows all other frequencies to pass. The rejector circuit acts as so much inductance in the receiver aerial circuit and must be compensated for by a reduction of capacity to tune.

There is a tendency in designing a system of high frequency telephone communication over power lines to recommend a much lower power set than is used for the distance for ordinary wireless telephony. It depends on the service for which the set is to be used which is recommended the low or high power. If it is for ordinary everyday communication a low power set will be satisfactory but if it is to be a standby to be ready to operate when all other communication lines are gone a set of higher power will be necessary. It is not easy to obtain data on this point but a set to be of any use during an emergency must be capable of transmitting and receiving a signal during normal operation which is strong and definite, several times stronger than the weak signal which is just intelligible. With this surplus of power in normal times the chance is fair that the set will carry through an emergency.

A paper on this subject would not be complete without a word of warning to the companies thinking of installing a similar system. The Shawinigan Water and Power Company's experience has been that the apparatus cost is only a small portion of the cost of installation. Complete sets are not yet on the market, and until they are, the assembly of parts into such a system requires a great amount of costly experimental work.

It would not be right to close this paper without mentioning B. L. Silver who commenced the investigations for the Shawinigan Water and Power Company early in 1919. First tests were made in November, 1919, and results began to appear early in 1920. It was only when the transmission line was invited in to help in the fall of 1920 that real encouragement came. From that time the work of installation went on easily with the idea of making handling by the station operators as simple as possible. The sets are now tested for a few minutes each shift and if the weather looks bad at any of the stations, the battery switches are closed and the system is ready for instant use.

Developments in Sewage Disposal

A survey of the principal modern systems.

C. J. Mackenzie, M.E.I.C.

Paper read before Calgary Branch, The Engineering Institute of Canada, January 6th, 1922.

In the beginning, before there were any large centres of population the problem of sewage disposal was a simple one, but it existed nevertheless. From the beginning the elements making up the wastes from vegetable and animal life have passed through the same cycles through which they are passing today in our most highly organized sewage treatment plants. Ashes to ashes, dust to dust, is a scientific statement of the cycle of organic life as we know it to-day, and yet the science of sewage disposal has been developed entirely within the past fifty years and the major part within the past thirty.

The problem of sewage disposal in its most general aspect then is one of supplying facilities to permit nature to do its work with the minimum amount of danger and nuisance, the "New" force which the engineer is "Developing for the use and convenience of man" is in this case a biological one. As the cycle of organic life is the basis of the science of sewage treatment it is essential to arrange our ideas clearly on this before reviewing the various steps in the development of the science. In the fall the leaves dying cover the ground with a layer of dead organic matter, but no objectional conditions arise. In time it is worked upon by hordes of living organisms of the microscopic order, and the organic matter is gradually borken down into such form that it is easily oxidized into the stable inorganic compounds of the constituent elements. The carbon of the organic matter becomes carbon dioxide, the nitrogen is converted into nitrates and so on. This is the first part of the cycle. The second phase is the constructional step. Green plants as is well known, absorb carbon di-oxide, nitrates in solution etc., and by photo synthesis build up organic matter, which may decay and die as vegetable matter or by animals be converted into a still higher form of organic matter, after which the inevitable death, destruction and oxidation to the harmless and stable inorganic form, occurs in a continuous cycle. The Sanitary Engineer is concerned with only part of this cycle. It is his duty to see that the destruction and return to the inorganic form of all the organic constituents of sewage is done with the least possible amount of danger and nuisance. There is also another phase to the problem. Sewage contains a great number of living micro-organisms which are important not because of the organic matter contained in them, but because they are able to transmit specific diseases such as typhoid fever. These organisms are known as pathogenes or pathogenic bacteria. The proper disposal of sewage requires that these bacteria must not be allowed to become a menace to the health of any community.

Objects of Sewage Disposal

Briefly then there are two objects in sewage disposal, first the treatment of the organic matter in the sewage, second the treatment of the bacterial content. In some cases it is not necessary to remove the bacteria from the effluent, in other cases the removal of the bacteria is the main object of the proposed method. Each disposal scheme is then a definite problem in itself and there is and can be no such standardization of plans and of designs as are found in other branches such as structural engineering.

The early developments in sewage disposal are best exemplified by their history in Great Britain. There have been drains or so-called sewers since the earliest times, but up until 1815 the laws of Great Britain forbade the discharge therein of any wastes, so that while there existed sewerage in name, in reality, there existed only systems of drainage. As the cities became larger and the population more congested it became increasingly more difficult for the individual householder to dispose of the wastes from his household, and the accumulation of filth became so bad that a commission on the health of towns was appointed. The report of this commission in 1844 was far reaching in its results as it revealed the very bad and dangerous state of affairs, due to the accumulated filth in the cities. The chief result of this report was the introduction of the water carriage system of sewage removal, and in 1847 the policy which was in force up to 1815 was reversed and the discharge of all sewage into the existing drains or sewers was made obligatory. Before the general adoption of the water carriage system the pressing problem was not one of sewage disposal, but one of sewage removal from the immediate environment. of the individual. With the introduction of water carriage the removal from the individual was accomplished in a very satisfactory and sanitary manner, but the town or city was then confronted with the problem of having properly to dispose of the total wastes of the community, which had been so conveniently collected and conducted to some place on the outskirts of the town. This problem then of disposing in a sanitary manner, of the organic wastes of a community which are held in suspension and solution by about 1000 times their volume of water, is the sewage disposal problem of today.

Naturally at first the sewage was discharged directly and without any precautions into the nearest body of water, either a running stream or the sea. This went on practically unnoticed for a few years until the pollution of streams became objectionable and dangerous. In 1857, in England, a Royal Commission on the sewage of towns was appointed whose duty it was to inquire into the best means of disposing of the sewage of towns and cities. Eight years later in 1865 this Commission made its final report in which it stated that "The right way to dispose of sewage is to apply it continuously to land and

it is only by such application that the pollution of rivers can be avoided". After the general principal had been established that all sewage must be treated before being discharged into streams (from which water supplies are to be taken) the development has consisted in the gradual evolution of more economical and more efficient methods of sewage treatment.

The developments in other European countries were along similar lines the first method of sewage treatment being to apply it directly to the land, and we still have today examples of sewage farms which are in operation and giving satisfactory results.

Undoubtedly the final effluent from sewage farms or from so-called broad irrigation, is as good if not superior to the best known artificial methods of today, but the large area of land required, the necessity of having a suitable soil and the doubtful economic aspects have all tended to discourage this method of disposal and the sewage farm is seldom considered to day except in arid regions where the benefits of irrigation are all important.

Intermittent Sand Filtration

The difficulties of broad irrigation suggested naturally the system of treatment known as "Intermittent Sand Filtration". It was found that on farms where the soil was sandy little trouble was experienced and very satisfactory results were obtained. The land did not become clogged and "sick" as it did on those where the soil was heavy, also the quantity of sewage that could be treated per acre per day was greater (poor soil often as low as 2000 gallons per acre per day while 10,000 was often used on the best). These facts suggested the construction of an artificial bed of the proper sized sand, without any attempt at cropping, the advantages being a much higher rate of filtration, with the consequent smaller area required for the sewage works. Thus the "Intermittent Sand Filtration", the first artificial method of sewage treatment, was first suggested in England about 1870, but the English were very much interested in sewage farms and the above mentioned method was never generally adopted there. In fact so closely were the English wedded to Land Treatment that it was not until 1908 that the Royal Commission on Sewage Disposal admitted that it was possible to purify sewage as well by artificial methods as by land treatment and at that date the order was cancelled which had made obligatory the application of all sewage to the land as a final treatment.

Intermittent sand filtration has become suggestive of New England and the Lawrence Experimental Station of the Massachusetts State Board of Health, for the experiments which were started at this station in 1887 may truly be said to have demonstrated the scientific basis and practical sufficiency of this method of sewage treatment. Following the early experimental work referred to above, a number of plants were constructed in New England where the availability of large areas of suitable sand made this system very acceptable for that locality. In intermittent sand filtration the sewage is applied to beds of sand which are underdrained for the purpose of collecting the effluent. The dosing is done on the intermittent system, the sewage is applied for a short time at a high rate and the filter allowed to rest for a day or so. The sewage trickles down through the sand and the air contained in the pores of the sand oxidizes the organic matter. The amount of the dose and the period of rest, and the total air space in the bed must be adjusted so that there is sufficient oxygen to produce the desired results.

Intermittent sand filtration in general principle does not differ essentially from broad irrigation, but it is scientifically controlled and operated and rates of about ten times those of broad irrigation may be obtained, (namely up to 100,000 gals per acre per day). The effluent from a well operated plant is stable, and a bacterial removal of over 99% can be obtained. Where suitable sand is available in situs this method is one of the best, but its advantages are naturally confined to certain localities, and while there are a great number of such plants in successful operation, especially in the New England States, more modern systems have been selected for most of the installations of the past decade.

The development of the intermittent sand filters, as has been suggested, was an outcome of the desire to pass the sewage through the filtering medium at a faster rate than was possible in broad irrigation. The same desire was being felt in England but due to the fact that large bodies of sand were not available, naturally experimentors tried other means of obtaining the same end and we find the "Contact Bed", the first of the so-called "Biological Processes" being developed. As all methods of treatment really achieve their ends as was pointed out chiefly by aiding the oxidizing activities of micro-organisms, it is doubtful if any of the methods has any right to the name "biological process" to the exclusion of the others, however, these latter processes, were so-called in contradistinction to the systems of broad irrigation and intermittent filtration, chiefly, it is believed, due to the fact that they were more scientifically studied and controlled and were conceived by minds that were attempting to make use of biological life.

Contact Bed

The contact bed was developed, as has been stated, due to a desire to treat sewage at a higher rate per acre than was possible on sewage farms. As sand beds were not available in England a still larger filler was suggested. It was realized that if a large filler was used and the sewage applied in the ordinary way in bulk, the liquid would pass through the filtering medium so quickly that there would not be sufficient time for oxidation, settling out of the particles in suspension by surface contact etc. Dibdin, chemist to the London Council proposed to overcome this difficulty by modifying the usual procedure of allowing the sewage to pursue a continuous journey through the filter and proposed making the tank which held the filler material watertight, thus allowing the sewage to fill the tank, when the sewage could be held in "contact" with the filler for a certain time in order to allow the removal of a certain amount of the suspended matter and also to allow the oxygen contained in the interstices of the filler to oxidize the organic matter, as was done in the other

methods. The filter was to be next emptied and allowed to stand empty to allow the filter to be recharged with oxygen. It was considered that the action would be the same as that taking place in intermittent sand filtration and broad irrigation. This we know is not quite the case, but the results were fairly satisfactory, a high rate was shown to be possible (500,000-1,000,000 gals. per acre per day) and the effluent of fair quality. When Manchester adopted the contact system in 1900 numerous smaller cities and towns immediately followed her example.

Trickling Filter

While Dibdin and others were working on the contact bed idea, several other sanitarians in England and the United States were directing their attention in a slightly different direction. Arriving at the same point at which Dibdin arrived, namely that when either sand was not available or when still larger rates were desired a larger filler would have to be used, they too recognized that the sewage if applied in the usual manner would pass through the medium too quickly, but they met the situation in a different manner. Instead of applying the liquid as before and retaining it in contact, they decided to allow the filter to act as before but to apply the liquid in a different manner, namely to apply the liquid in a thin stream and not as usual in bulk. By applying in a small stream the liquid trickled over the filter in a thin film at a very slow rate, so that its passage through the filter was prolonged for a sufficient time to allow the desired aeration, and the filter medium was kept supplied with air all the time and conditions made very suitable for a ready and complete oxidation of the organic matter. This method became known as the trickling or percolating filter and the practical problem became one of developing some apparatus or arrangement that would distribute the liquid in the desired form over the filter bed. A number of inventions followed and we have the stoddart trays, the various mechanical distributors, so popular in England, and finally the stationary nozzles which are favoured most on this continent. The trickling filter has a high rate, from 1,000,000 to 2,000,000 gals. per acre per day. Generally it may be said that for ordinary conditions the trickling filter has an advantage over the contact bed. On the basis of the cubic yardage of the filler medium the trickling filter will treat about twice as much liquid as the contact bed, due in part to the fact that in the contact bed there is a gradual clogging and loss of capacity. Trickling filters adapt themselves to variable flows better, and the effluent from the trickling filter is usually more stable. The contact bed has the advantage of smaller loss of head, and less nuisance from odors and flies, which advantages are most pertinent in smaller and institutional installations. The bacterial reduction in both of these two methods is less than that of intermittent filtration and if bacterial reduction of any extent is required some form of disinfection must follow each of these methods.

The experimental work at Columbus, Ohio, in 1904-05 firmly established the trickling filter in America and up until the past 10 years this method has undoubtedly been most popular as the oxidizing unit in America Plants.

All the methods mentioned so far have to do only with the final or oxidizing stage of sewage treatment, and must not be confused with the preliminary treatment, which is a part of nearly all processes today, the development of which will now be traced briefly.

Sedimentation

It was early realized that if the grosser solids were removed from the crude sewage that the resulting liquid could be treated at a much higher rate on sewage farms, Intermittent sand filters, contact beds and trickling filters, accordingly the first measures consisted of some form of screen for the removal of floating matter such as sticks, paper, etc., and a preliminary detention period in some form of sedimentation tank where the reduced velocity permitted a considerable proportion of the solids in suspension being settled out. This principal of preliminary treatment is as sound today as it was then, the type of preliminary treatment has however been subject to developments.

Many experiments were conducted to ascertain the proper size of the sedimentation tank, period of detention etc., to give the most economical removal of solids. The total amount removed affects the cost of the final treatment, so that in considering the economics it is necessary to consider the treatment as a whole. The liquid effluent from plain sedimentation (which is a mere settling out and not holding of sludge for biological action thereon) was so much easier to treat than crude sewage that enthusiasts immediately argued that if a little removal was good a great deal more would be better and chemical precipitation was the result. Plain sedimentation on the average with 2-6 hrs. detention can remove from $\frac{1}{3}$ to $\frac{1}{2}$ of the suspended matter. A longer period of detention does not remove the remainder in anything like a comparable rate, as much of the suspended matter is in a highly comminuted and colloidal state, and does not settle out readily. The application of suitable chemicals however produces a coagulent and a high degree of clarification may be obtained. This process was taken up enthusiastically in England but has never reached the same degree of popularity on this continent and is seldom considered today unless under special conditions of trade waste. The chemicals most commonly used are lime, alum, copperas, ferric sulphate, and alumino-feric. While chemical precipitation gives a clear effluent it is not a final treatment and the great volume of sludge to be disposed of and the high cost of chemicals usually make other processes more desirable. A great deal of work has been done by agricultural chemists, especially in England in an endeavour to recover the fertilizing value of the sludge at a profit, but to date satisfactory results have not been obtained. The disposal of the sludge has always been, and is at present one of the major problems in sewage disposal from a financial standpoint as well as a sanitary one, and perhaps no phase of the problem is receiving more attention and thought today.

Septic Tank

In 1895 Donald Cameron designed a tank for Exeter which he patented under the name "Septic Tank" this

process has had a very marked influence on sewage disposal processes and great claims were made and much expected from it for a while, but time has shown that the claims and promises were much too optomistic. The process was hailed as the final solution of the sludge problem and was so regarded for a few years, but unfortunately the sludge problem still is with us. Since the early '80's' scientists, especially in France, had been considering the biological action in sewage. They had demonstrated that if liquid sewage was retained in a vessel from which air or oxygen was excluded or held in what they termed an anaerobic state, there was an action carried on by the aid of micro-organisms, called anaerobes, which resulted in some of the organic matter in suspension being liquified. In France, England and America tanks had been installed with trapped inlets, but it was found that the effluent from these was very troublesome. The septic tank of Cameron's was designed to overcome this difficulty and was operated in two steps the first the anerobic tank where complete liquification was supposed to take place and from which the effluent was discharged over a weir to a contact bed, where it was subjected to the influences of oxygen, called the aerobic bed.

Many plants were built in England and the process aroused great interest in America where Cameron and his associates took out patents, over which a great amount of litigation ensued. There is no doubt that the "Septic Tank" did a great deal towards clearing up the matter of biological action in sewage and sludge under anaerobic conditions, but the claims were greatly exaggerated and practice has shown that all the sludge cannot be liquefied and that the sludge problem still exists. The practice of patenting processes and methods, which pertains in England, is accepted there quite naturally, but in America such practice is not the rule and engineers felt that Cameron had no rights to principles which had been used and recognized for some time. The litigation caused by the septic tank patents is interesting reading and brought out a lot of valuable information. The legal difference in the United States between a septic and plain sedimentation tank was held to lie more in the operation than in the construction and engineers were able to evade the payment of royalties by cleaning out the tanks frequently and operating so that there would be some dissolved oxygen present at all times in the effluent. The unpleasantness of the above mentioned litigation prejudiced American engineers against the septic tank and they never became as popular as in England. The claims that the effluent from septic tanks was easier and more satisfactorily treated on trickling filters has not been borne out and if anything the reverse, namely, that the advantage lies with effluents from plain sedimentation, seems to be true.

Imhoff Tank

The next and most important development was the demonstration of the "Imhoff Tank" or the two stage sedimentation tank. The double compartment tank as we know it usually bears the name of Imhoff but its development was not totally due to him. There can be no doubt that the Imhoff tank was suggested by the Travis tank built at Hampton, England, by Dr. Owen Travis, in 1904. At that time there was a general feeling that by use of septic tanks followed by contact beds or filtration the organic matter in the sewage could be reduced to a satisfactory condition largely through the agency of bacterial life, but the actual experience in operating plants was not so satisfying. The much talked of liquifaction did not take place to the extent that was desired and clogging of beds occurred with objectionable odors etc. Dr. Travis concluded that the trouble arose because a large part of the suspended matter was non-settleable due to the fact that it was so thoroughly mascerated, and that this matter appeared in the effluent from settling tanks and clogged the contact beds. His idea was to remove this matter by allowing the particles to come in contact with plates on which the fine particle would collect. He therefore designed what he called a hydrolyzing tank. The tank closely resembles what we know as the Imhoff tank with a few minor differences. The tank was divided into three chambers, the two side chambers called the sedimentation chambers were like the upper story of the Imhoff and narrow openings or slits at the bottom of these chambers led into the liquifying chamber, which not only extended underneath the sedimentation chamber but also extended to the surface thus dividing the surface into three areas. The sewage was admitted to the sedimentation chambers where a number of plates were suspended, whose function it was to gather the fine matter in suspension, after which the solid matter would drop to the bottom of the tank and pass through the slots to the liquifying chamber, where it would decompose and the gases of putrefaction. would not come in contact with the main body of the fresh sewage. Dr. Travis contended that it was necessary to pass from 1/6 to 1/8 of the fresh sewage through the liquifying chamber in order to keep the sludge seeded with fresh bacteria. While Dr. Travis was essentially striving to establish the fact that the chief action was physical contact and the so-called hydrolyzing action, other sanitarians saw in his tank a means of overcoming one of the troubles of the single story sedimentation tank. It had long been felt that the decomposing gases arising from the sludge at the bottom of ordinary tanks, in passing through the liquid above caused the liquid to take on the foulness of stale sewage and make its subsequent treatment more difficult and offensive. Imhoff built a tank which had the features of the Travis tank with the exception that no plates were placed in the upper chamber and the liquifying chamber lay entirely underneath the sedimentation chamber and was connected thereto only by the slots in the sloping sides of the sedimentation chamber bottom. The gas from the decomposing sludge was removed by special flues discharging directly to the atmosphere above. This tank was taken up eagerly on this continent, especially was it accorded a friendly reception because American engineers were very displeased with the septic tank litigation and also because the tank seemed to meet the objections which had manifested themselves in ordinary sedimentation and septic tanks. The fresh sewage was not made foul by the gases of decomposition and the sludge itself was of a better character, contained less water and dried more readily. So well thought of was the Imhoff tank in America that from its inception until 1914 about 75 cities and towns in the United States had plants designed using them. In 1914 for complete

sewage treatment works the nearest approach to anything like a recognized standard that had ever existed for such in America, was probably screening, Imhoff tanks, trickling filters and chlorination, but today we are in the same condition as before and the results of experience since 1914 together with experimental results on new processes, have brought home quite clearly again that we are still in the development stage and that nothing like an universal and entirely satisfactory process has yet been proved.

The practical results of Imhoff tank operation have not been as satisfactory as could have been desired, much trouble having arisen from frothing and foaming and this year Baltimore in planning extensions has discarded the Imhoff tanks in favour of single story tanks with separate sludge digestion tanks after several years of experience with both, although it should be noted that special conditions pertain there. In Germany, Dunbar has even questioned the need for sludge digestion at all while other engineers have designed installations where the sludge is immediately conducted to a separate sludge digestion tank.

Within the past ten years several new methods have been experimented with on a working scale and much experimental work has been done on details. The three most important processes proposed in order of importance, are; the activated sludge process, the Miles acid process and the direct-oxidation process. The last named process is an adaptation of the old electrolytic process of purification which has been proved to be such a dismal failure and it is difficult to believe that the newer adaptation which is still more complicated can be made a practical success. This process consists of coarse screens; fine screens; grit chamber; electrolytic tank where lime is added and the sewage passed through a tank in which are rows of electrodes between which innumerable paddles revolve and across which an electric current is passed; and finally sedimentation. This system is in essence the old electrolytic process which has been definitely proved unefasible and it does not seem to warrant discussion.

Activated Sludge Process

The activated sludge process has no doubt been the most talked of development of the past decade and like so many other new processes raised hopes beyond their degree of realization.

The inspiration which led to this process is undoubtedly to be found in the experimental work of the Lawrence Experimental Station of the Massachusetts State Board of Health. In 1912 experiments were begun at this station on the effect of blowing air through sewage. The experiments were first conducted in gallon bottles but later tanks were constructed which were filled with layers of roofing slate. Most extraordinary and astonishing results were found, for besides a certain amount of oxidation, which was to be expected, the sewage was clarified more than by any of the other ordinary clarifying processes. In addition the sludge which was deposited on the slate was well fermented and inoffensive. Dr. Fowler of Manchester, England, observed these experiments and on his return to England arranged for experiments to be carried out there under Messrs. Ardern and Lockett who are really responsible for the discovery that the aerated sludge played the important part in the results obtained. They found that when raw sewage was first aerated it took about five weeks to obtain complete nitrification, but if the liquid portion was drawn off and further raw sewage when added the time to obtain nitrification was shortened and when this process was repeated several times it was possible to obtain nitrification in a few hours. The sludge which makes this possible was termed "Activated Sludge".

By this process a high degree of clarification and nitrification was obtained and the resulting sludge was flocculent in character and could be separated from water at quite a high rate. This process was widely proclaimed as the final solution of the sewage disposal problem and many experiments were started both in England and America to determine the best method of diffusing the air throughout the sewage, the best periods of aeration to adopt and the most economical amount of the sludge to treat given quantities of sewage etc. In this country the most elaborate and perhaps the most significant experiments were conducted at Milwaukee under the direction of T. Chalkley Hatton, and in consequence of these experiments that city has adopted this process for treating its flow of 130 million gals. per day. It should be noted that during the same period and after extensive experiments the cities of Cleveland and Worcester decided that this process was not suitable for them. In Milwaukee there were three conditions or requirements which the activated sludge process seemed to satisfy best. (1) The necessity for an effluent of 90-95% bacterial removal (2) Small area available for the plant. (3) The necessity of disposing of the sludge so as to avoid offensive odours and nuisance to the lake. At Milwaukee a great deal of experimental work was done on the best methods of drying the sludge and it was expected that the final product could be disposed of as fertilizer at a profit. Whether this can be done with the decreased price now prevailing is an open question and is subject to doubt.

At the present time it may be fairly said that this process is still in the experimental stage as to practical results. That it is undoubtedly one of the most important processes that has come to the front lately but that the difficulties of operation, the mechanical and practical difficulties of de-watering and recovering the fertilizing value of the sludge, the possible effects of trade wastes in the sewage and many other practical considerations point to the absolute necessity of carefully considering local conditions before adopting this process. The future success of the activated sludge process appears to depend upon the possibility of economically disposing of the large amount of sludge that is formed.

Miles Acid Process

The Miles acid process is essentially a process for special conditions and received its greatest prominence

due to the fact that it was recommended as the most suitable method of treating the sewage of New Haven where special conditions prevail.

In brief the process consists of treating the raw sewage with sulphurous acid which appears to have a selective toxic action on bacteria, more intense than the same hydrogen ion concentration of sulphuric acid. The procedure is to apply SO_2 gas derived from burning sulphur, to the sewage, which precipitates about 90% of the matter in suspension. The great advantages of this process are that substantial reduction in suspended matter is achieved and while the effluent is not nitrified it is sterilized. Further the sludge is in such form that there is the possibility of realizing on the fertilizing value. In addition to all the above advantages it has the special advantage of being comparatively inexpensive to construct. At New Haven the disposal problem required that the bathing beaches and shellfish layings be kept free from bacterial infection and nuisance from floating solids. The Miles acid process was held to have an advantage over screens, Imhoff tanks, or activated sludge, as the effluent from the Miles process has about 90% bacterial removal; sufficient removal of the solids in suspension; and while the effluent was not nitrified the large body of water into which it discharged was ample to achieve this result with no offense. It will be seen then that the Miles acid process promises to be a very valuable one for special cases.

The necessarily general review of the developments of artificial sewage treatment processes will, it is believed, show that there has not as yet been developed an artificial method of treating sewage which is entirely satisfactory as a general one and finality has by no means been reached. We are still in the development stage and, while the sewage of any city may be disposed of satisfactorily from a sanitary standpoint by a careful selection of known methods, every case must be carefully and intensively studied and treated as a special case and no method can be stated as a satisfactory standard for general use. One point should be clearly borne in mind and that is the ofttimes overwhelming influence of the economic factor and that progress and procedure in the sanitary field is more associated with availability of funds than is the case in most other fields.

Disposal by Dilution

So far nothing has been said about the most common and likely the most important single method of disposal, namely disposal by dilution, and it is desired to point out that disposal by dilution, or as we commonly know it by discharging the sewage into a large stream or other body of water, is scientifically just as properly termed a method of treatment as any of the artificial methods so far mentioned. That it is practically the most important will be realized from the following table which gives by provinces the number of people in Canada connected to sewerage systems and the number and percentage of these people who are contributing to sewerage systems served by disposal works.

Province	Pop. served by sewerage systems	Pop. served by Sewerage Treatment Works	Percentage of pop. sewered who are served by Treatment Works
Nova Scotia	164,000	0	0
New Brunswick	96,000	0	0
Prince Edward Island	14,000	0	0
Quebec	843,000	413,000	50%
Ontario	1,344,000	838,000	62%
Manitoba	210,000	8,500	4%
Saskatchewan	136,000	91,000	65%
Alberta	176,800	80,000	45%
British Columbia	312,000	26,000	8%
Canada	3,295,600	1,456,500	44%

(NOTE) The data for the above table were obtained from "Water Works and Sewerage Systems" published by the Commission of Conservation in 1916 and while some additions have no doubt been made since, the Table is sufficiently correct for the purposes used.

It will be seen from the above table that over 50% of the sewage of Canada is discharged directly into streams, lakes and tidal waters without any treatment whatever and a large part of the sewage nominally treated is discharged into lake waters after a very limited preliminary treatment, so that when the statement is made that disposal by dilution is one of the most important methods no exaggeration has been made.

Pollution

Sewage discharged into a body of water may become objectionable in three ways. First the dilution factor may be so small that the body of water does not contain sufficient dissolved oxygen to oxidize the organic matter in the sewage. If this is the case a very serious condition arises, the stream or body of water changes to an anaerobic condition with the emission of every kind of foul odour. This state of affairs occurred on the River Thames in the early days, and has occurred where the sewage of towns has been discharged into very small streams, but it is a condition of affairs that can never be tolerated and is seldom a problem in disposal, as it is rarely that such a small ratio of dilution is ever approximated. The best example of a disposal scheme where this criterion was the controlling one is that of the Chicago Drainage Canal, and the experience gained there and the investigations and experiments conducted for the solution of that scheme supply the most reliable data on the question of what dilution is necessary in order that the dissolved oxygen may be sufficient to oxidize the organic matter in solution and prevent the stream from becoming foul. The Chicago Drainage Canal was designed to give a dilution factor of 3.33 c.f.s. per 1000 population but observations now seem to indicate that a figure between 4 and 5 is more nearly correct. Langdon Pearse, sanitary engineer of Chicago Sanitary District, states, "From the viewpoint of nuisance prevention a sewage dilution of 4 to 7 sec. ft. of stream flow per 1000 pop. has been indicated with a lower limit of 2 and an upper of 10". It should be recognized that when a stream is polluted to this extent, while it will purify itself in time, it would not be safe to use this

supply even after water filtration until the water had flowed a long distance.

Following the opening of the Chicago Sewage Canal the State of Missouri instituted legal proceedings claiming that the Mississippi at St. Louis, a distance of 357 miles from the source of pollution and from eight to eighteen days in matter of time, was infected by the Chicago Drainage Canal and the water supply of St. Louis made unsafe. A great deal of evidence was submitted but no definite legal findings were made. It was held that damage to St. Louis had not been proved but the case was dismissed without prejudice, thus admitting that while proof of damage was not established that it was by no means certain the damage did not exist and that the City and State were free to open up the case again if desired. The result of the above mentioned trouble from an Engineering standpoint has been that a great deal of valuable and reliable information on the self purification of streams has been obtained. We may dismiss as a special case then the case where the dilution factor is to be just sufficiently high to prevent a nuisance, and consider the more common cases.

The second way in which sewage discharged into a body of water may cause offense is in the unsightly appearance of the larger and grosser solids floating on the surface. This occurs chiefly in lakes, harbours, and is very offensive near bathing beaches. It would seem that common decency would dictate that all sewage being discharged into any such waters should be screened to remove such material even though it is not the source of any actual damage.

The third condition is the most important, namely that case in which sewage is discharged into a large stream or lake where the volume is large enough to oxidize the organic matter of the sewage without any appreciable reduction in dissolved oxygen, the actual dilution being so great that all traces of sewage soon disappear just by being mixed with a much larger volume of water. The real objection arising out of the fact that the diluting stream or lake has become infected with bacteria which makes the water, which is in other respects suitable for drinking purposes, unsafe to use.

This is the problem which faces the towns and cities which are situated on the Great Lakes, and on most of our large rivers, which are destined to be used for the water supply of other towns and cities further down the stream. In the majority of cases the diluting factor is sufficiently great to easily take care of the organic matter, although it is usually necessary to remove the grosser solids which are liable to settle out into the bottom of the river or lake and cause sludge deposits or beds which may subsequently become objectionable, but the bacterial infection is so great as to make the water unfit for drinking purposes immediately below.

The problem is a complicated one as it involves the rights of all parties living on the banks of the stream. Is it just that a large city should so pollute a stream as to make it unfit for domestic use for the town further down? Is it just that a city should be made to purify to the Nth. degree its sewage before discharging it into a stream in order that a small town below may be saved the expense of a water filtration plant which would not cost perhaps one hundredth of the cost of treating the city's sewage? Would the same stream be fit to use as an unfiltered water supply even if the city did purify its sewage? And what is the maximum infection that may exist in the raw water in order that the water from a good filtration plant may be considered safe at all times? The above questions have been a source of debate for the past years, but there is gradually evolving a safe and equitable policy with reference to this problem.

The whole question was faced very definitely and squarely some years ago by the International Joint Commission. Article 4 of the Treaty between Great Britain and United States under which the above mentioned Commission functions states, "It is further agreed that the waters herein defined as Boundary Waters and waters flowing across the boundary shall not be polluted on either side to the injury of health or property of the other." Complaints had arisen that this article was being violated and the Commission therefore decided to make a thorough investigation, which they did, and their final report should be carefully read by those interested in this phase of the problem. The commission approached the subject by calling in well recognized authorities and sanitary experts both from Canada and United States and by a series of direct questions bringing out the information desired. It was early seen that as the boundary waters consisted chiefly of the Great Lakes and large rivers such as the St. Lawrence, Niagara, etc. that the question of infection by bacteria was the only serious question.

Without going into the details of the report the writer would like to point out briefly the opinions expressed which by the international importance attached to them and by the standing of the experts consulted have tended more than any other thing in recent years to crystallize professional opinion on the general policy of the mutual responsibilities of sewage disposal and water supply plants of towns situated on the same river. There is a growing opinion that the program of sewage disposal and subsequent water supply on the same stream should be considered as a single problem and the solution lies along the lines which will give the greatest total benefit for the minimum expenditure.

The Joint Commission found that the using of a stream for drainage and sewage disposal constituted a natural resource and as such should be conserved, always keeping in mind the rights of the people as a whole and not only those of a single community.

The inquiry also brought forth the unanimous opinion that water supplies from streams and surface supplies which were not polluted by the sewage from any sewerage systems, but merely from the natural drainage of agricultural lands, rural communities etc. were not safe to use without filtration but were quite safe after filtration.

The next logical step was to ascertain how much infection it would be safe to allow in the water to be filtered, and then make any town or city so treat any sewage contributed to the given supply, to such an extent that no undue burden would be placed upon any water filtration plant. The substance of the findings of the Commission have been arranged in practical form by Prof. Earle B. Phelps of the U.S. Public Health Service as follows "In all cases where the actual stream flow below any one point of

pollution is less than 4 cu. ft. per sec. per capita of contributing population or where the net effect of successive pollution with proper allowance for self purification in the intermediate stretches exceeds the equivalent of one contributing person per 4 cu. ft. of stream flow sewage treatment shall be employed to reduce the net bacterial pollution to a basis of an effective dilution of 4 sec. ft. per capita as defined".

It may be said then that there is a growing acceptance of the principle that disposal by dilution is economically sound and proper under certain restrictions namely that the water supply of any community further down stream shall not be infected beyond the degree referred to, so that by proper water filtration a satisfactory supply can be obtained. That it is unwise and unsound to simply demand that every city or town shall purify all sewage discharged into a stream to the same degree. But that each case should be considered as a special one and the degree to which the sewage shall be treated shall depend entirely upon the conditions of the stream under consideration.

In attempting to cover in one paper the entire field of Sewage Disposal it has of course been necessary to treat everything in a very general way and no attempt has been made to enter into details at all. It will be noticed that matters of cost, which are admittedly so important have been left out. This has been done advisedly as cost data used to draw comparisons between different processes, stated for the general case, are more apt to be misleading, than of value. As it has been pointed out, every sewage disposal problem is a special case and should be studied as such, when it will be found that local conditions will largely govern the difference in costs between different methods. Before it is possible to state which system will be cheaper and best for any city it is necessary to study carefully and scientifically not only the local conditions as to composition of sewage, variation in flow, climatic conditions, characteristics of the body of water into which the final disposition must be made, but also the availability of suitable sites and the adaptibility of the existing sewerage system, for one system might mean the construction of an expensive intercepting or outfall sewer, the cost of which should be properly charged against such system. The final decision as to what system should be accepted will be governed by the two factors of cost and sanitary results desired, and unfortunately the cost factor is not always the minor one.

Rainmaking

The connection between meteorology, irrigation and vegetation.

R. W. Boyle, M.Sc., Ph. D., F.R.C.S., Dean of the Faculty of Science, Alberta University.

Paper read before the Calgary Branch of the Engineering Institute of Canada and the Alberta Military Institute at a joint meeting, January 27th, 1922.

It is probably due to the military men of the past that we have the superstition that cannonading and the loading of the air with smoke particles can and does induce the rain to fall. The wounded from a battle, lying out on the battlefields and suffering, are made more wretched if the rain falls and adds cold and dampness to their misery, and the fact of the rainfall in such a condition fixes itself indelibly on the memory, while the fact that the weather is fine after a battle passes unremembered. Hence cases of a rainfall during and after a battle have been remarked on with wonder, so much so that a veritable superstition that it will be so after nearly all battles has arisen.

The British Admiralty once carried out a test to seek accurate information if rain could be made to fall by cannonading. A firing party with guns and ammunition once landed at a point on the coast of New Zealand where the air was usually heavy and moist. They fired away to their heart's content and reported that no certain results in the deposition of rain by the cannonading could be determined.

It is the writer's wish that some way to induce rain to fall, where and when it is wanted, might be reported here but it is impossible to do so and nobody is known who can. Only a little of nature's process is known and all that can be given here are the opinions of meteorological physics. The figures used on based government meteorological reports.

All forms of organic life and most of inorganic on our earth depends upon water and air. In every locality there are at least two forms of water, water itself and water vapour, or ice and water vapour. It is impossible anywhere to have ice, snow, or water, without having water vapour over it. When warm, the vapour will exist over the water in much greater quantity than over ice or snow when cold. There is a definite maximum amount of water vapour that can exist in the air for each temperature; and when warm, moisture saturated, air is cooled it can no longer hold its content of vapour and the excess is deposited as cloud fog or rain. The most important factor for the adequate and frequent supply of rain to a district is the supply of moisture. A simple calculation makes this plain. The weight of water falling on an acre in a one inch rainfall is about 113 tons, so that if a district of 100 miles radius (about 20,000,000 acres) wishes a rainfall of, say, four inches during a certain period of time, a total of about 9,000,000,000 tons of water must be provided. Therefore, when a heavy fall of rain occurs, a large amount of moisture is taken out of the air, and unless there were some agency for replenishing the supply there would come a time when permanent drought could not be avoided. Nature sees to the res-

toration of the supply of moisture to the air in her quiet and beautiful process of evaporation. There is always evaporation going on from the surfaces of water, snow or ice; more of course from water, but still the amount from snow and ice is also appreciable.

The higher the temperature the greater, and the faster is the evaporation, and consequently the great fields of evaporation for replenishing the vapour in the air are the oceans, and especially that part of the oceans in the tropics. These then are great supply reservoirs, and the distributors that convey the vapour over the world to support our life are the winds. There is an old saying: "He who controls the winds controls the rain".

Wind Formation

The pressure of the atmosphere at any level is not constant but varies from place to place and from time to time. In some regions it will be high, and inevitably, in other places, low. The difference of pressure causes a flow of air which is the wind from an area of high pressure to an area of low pressure. The air flows from higher pressure level to the lower. The greater the fall of pressure the stronger will be the wind — sometimes it will be a hurricane; and the less the fall of pressure the more gentle will be the wind.

The government meteorological offices make out the weather charts by plotting on a map the pressures at a given time at different places of a region. This method has been going on for years and now we know that these areas of high and low pressures have very definite forms, and very definite wind circulations, in the form of spirals, around them. These systems of circulating air travel, sometimes fast, sometimes slowly, and their tracks are now tolerably well known. All our storms are associated with the low pressure systems, while at the high pressure areas, the weather generally is fine and clear. Generally to the East of the low pressure area the weather is warm, moist, cloudy, and at times wet, while to the West the weather is clearing. The winds are often very strong from the West or North West with temperatures rapidly falling

Movement of Low Pressure Areas

It is the movements of these low pressure areas which bring the rain and snow. The position of any locality with respect to the centre of the low pressure area determines whether it will receive any of the precipitation.

In Southern Alberta we are just to the East of the Rocky Mountains which act as a barrier to shut off the warm, moisture laden winds of the nearby Pacific ocean, so that we probably obtain all or nearly all of the moisture which does fall from the more tropical Pacific ocean further South. Most of the storm tracks of this part of North America pass either to the South or North of Southern Alberta, so that we receive rain from only occasional storms which cross the region. It is due to this fact alone that the rainfall in Southern Alberta is often inadequate and very precarious. The effects of the mountain barrier on the climate here and at the British Columbia coast are well understood. Masses of warm, moisture-laden, air from over the Pacific strike the mountains and rise. In moving upward they expand and consequently cool. The excess of moisture must be precipitated and it descends as rain on the coast and snow on the mountain-tops. On the other side of the mountain barrier when the wind, deprived for the most part of its moisture, blows over the mountains and sweeps down into the valleys beyond, there is a compression of the air as it descends and a consequent raising of its temperature. It becomes therefore a warm wind, such as the "foehu" wind of the Alps and the "Chinook" of Montana and Southern Alberta.

Rain Formation

As has already been implied the only way that is known for the air to turn its water vapour into water is for the air to be cooled. We shall see that the amount of energy so involved is so enormous that the matter of the use of some kind of chemical agency by man to cool the air is out of the question. The only cooling we can think of is the natural process of nature in cooling by expansion.

It is illuminating to consider the refrigeration involved in condensing the vapour, — even assuming that there is a sufficient supply, — to provide whatever rainfall may be desired in a district. One inch of rain on an acre has a weight of 113 tons. To condense this from vapour requires cooling to deprive the vapour of its latent heat. We know that this amount of latent heat is about the same as the latent heat given up by 800 tons of water in being frozen to ice. Now we know from refrigeration data that it would take a 2,000-horse power refrigeration plant to produce 800 tons of ice in a day. If four inches of rain were made to fall over an area of 100 miles radius, in as long a time even as 100 days, it works out that 800,000,000 horse power would be required, working all the time.

This estimate leaves out the cooling of the air containing the vapour, which necessarily would be involved, and which also would be enormous.

Let us look at the problem in another way. The water fallen in a rainfall must have been supplied from vapour which was sometime previously produced by evaporation. To evaporate enough water to supply an inch fall of rain to an acre (i.e. 113 tons of water), requires all the heat produced by burning eight tons of good coal. For a four-inch rainfall on an area of 100 miles radius, the equivalent of the heat from burning 640,000,000 tons of coal would be required. We see in this matter of a simple rainfall, one of nature's great wonders that we rarely think about, and over which man is powerless. Nature accomplishes this colossal operation steadily, consistently, and quietly, and, to our shame, almost unregarded by us with gratitude or wonder. Measurement of the heat given out by the sun to our earth, shows that the sun's heat is sufficient to evaporate enough water to give an annual rainfall of 40 inches over the entire surface of the earth, and still have some to spare.

Even when there is a sufficient supply of water vapour to a district, and there is the necessary cooling to condense it to water, there yet remains another great problem involved in its condensation and subsequent fall to the earth. After condensation it is another great problem to make the water fall.

Some physicists hold the idea that the vapour in the air cannot be condensed unless there are dust particles, or electrified particles in the air to act as nuclei for its condensation. This is a very interesting consideration. It is certain that very small particles are of important assistance in enabling vapour to condense, but whether they are always essential is an undetermined question. Experiments show that the fewer the particles present for the same amount of moisture in saturated air, the larger will be the drops and the faster they will fall. Drops fall at a rate depending on their size and by measuring the rate at which they fall, and knowing the weight of water so precipitated, it is possible to calculate the number of drops and their size. So it has been found that fog particles are about 1/2500 of an inch in diameter and fall seven inches a minute; light rain drops are 2/100 inch in diameter and fall 400 feet in a minute; and heavy rain drops are 6/100 inch in diamteer and fall 1000 feet (i.e. about 1/5 of a mile) in one minute.

From these figures we can estimate approximately,— and we do not pretend it to be any better than a rough approximation,— the amount of rainfall obtainable from a cloud. The size of fog particles is so small, and they fall so slowly, that they could never of themselves reach the ground. From 1000 cu. feet of air filled with fog particles, there is obtained only 1/150 ounce of water, but the number of drops in this volume is as great as 420,000,000. If in some way, these droplets each could be made by a plentiful supply to grow to the size of large rain drops, there would be a yield of 24 cu. feet of rain. If we, therefore, consider a column of cloud, 1000 feet high, — which is about the thickness of many clouds, — on a base of 100 square feet, it would yield 288 inches of rain, a veritable deluge. The figures show then, that there are in the air always far more than enough particles on which vapour can condense to form rain. In fact the evidence is that the proper artificial course to pursue, if we could pursue one, would be to reduce the number dust partticles in the air, so that the air contained relatively few of them, and on these the vapour could condense in large drops that could readily fall. Even at that they might only fall a short distance and never reach the ground; for, unless the air were saturated, they would evaporate again as they passed through the unsaturated drier air below the cloud level. Neither is it possible, after the fog particles are formed, for them to unite to form large drops and thus get to earth. In that case the rainfall would be insignificant, amounting to only 2/3 ounce from a cloud base of 100 feet square and 1000 feet high.

The great point of all these figures is again to show that we must have enough moisture supplied. If there is, there are plenty of particles in the air to condense it. To sum up, — let us think of the ease and simplicity of nature's mechanism for a simple fall of rain, and at the same time not fail to remember the immense energy involved. To the east of the low pressure area the air is damp and warm, and on account of the density and pressure distribution in the circulating air it is forced to rise. As it rises it expands and is therefore cooled, and when it reaches the cloud level it is saturated. In passing up through the cloud the moisture is condensed on the fog particles already there, and these grow rapidly in size. As they grow they fall, thus coming in contact with more saturated air. By this time they have become fair sized drops and can fall as rain. The rain will continue just as long as the cloud is fed with saturated air, but as soon as the supply of saturated air stops the rain will cease. This is the main process, other factors are casual and non-essential. The volume of air required to yield the moisture for a rainfall of four inches on an area of 100 miles radius is enormous. If the air is saturated at 60°F and is then cooled by only 10 degrees, i.e. to 50°F. the air current supplying the moisture would be something like 200 miles wide, 700 yards high, and 3500 miles long.

Some of the physics of a rainfall have been given to you. The works of man are puny in comparison with the operations involved and it has taken many years of persistent observation and study to elucidate the process. It is a good example that the service of science is that of truth. Science forwards her researches and applies her principles and methods within the realm of all observable phenomena. Her followers usually are not materially rewarded, and her true devotees will not take advantage of those who may be unfortunate or long-suffering. The method of science is painstaking, laborious. honest, and long. "There is abundant need for the use of the intellectual enlightenment which science can supply to counteract the ever-present tendency of humanity to revert to primitive ideas. Fifty years of compulsory education is but a moment in the history of man's development, and their influence is as nothing in comparison with instincts derived from our early ancestors, and traditions of more recent times grafted upon them. So little is known of science that to most people old women's tales, or the unsupported words of a casual on-looker, or the devices of the sincere misguided, or of the charlatan, are as credible as the statements and conclusions of the most careful observers. Within its domain science is concerned only with evidence. It claims the right to test all things, and then hold fast only to that which is true. It declines to accept popular beliefs as to thunderbolts, production of rain, influence of the moon on weather, or that of underground water or oil on a forked twig, solely and simply because when weighed in the balance these beliefs have been found wanting in truth. The interest of science in mystery is that of inquiring into the mysteries to find a natural reason for them. Mystery is thereby not destroyed by knowledge but removed to a higher plane." — (Sir Richard Gregory.)

The writer:

I have given you some of the physics of a very common and ordinary phenomenon; but it is precisely the common phenomena and things that we know least about.

ENGINEERING JOURNAL

THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

VOL. V. May 1922 No. 5

Professional Meetings 1922

Vancouver: June sixteenth and seventeenth.
Winnipeg: September fifth, sixth and seventh.

Vancouver Professional Meeting

A tentative programme of the Vancouver Professional Meeting has been received by wire at Headquarters from the Secretary of the Vancouver Branch. This meeting, which will be held immediately following the Good Roads Congress at Victoria, is under the joint auspices of the Vancouver and Victoria Branches, the dates being Friday and Saturday, June 16th and 17th. The tentative programme includes:—

Friday, June 16th.

Morning: Papers on Town Planning and Irrigation.

Noon: Luncheon.

Afternoon: Visit and Inspection of Ballantyne Pier-Papers on Engineering in British Columbia and the Logging Industry.

Saturday, June 17th.

Morning: General session. Discussion on Institute affairs, particularly in their local application and including the question of reorganizing the British Columbia Provincial Division.

Afternoon: Sightseeing.

Change in By-Laws

The vote on a proposal to change section 52 of the By-Laws resulted over-whelmingly in favour of the proposal. The report of the scrutineers to Council indicated a contrary vote of seventy-six and an affirmative vote of eight hundred and seventy-one.

At the meeting of Council held on April 18th the scrutineers' report was accepted and the change in the By-Laws confirmed. Section 52 of the By-Laws will now read:—

"Each Branch shall be managed by an Executive Committee or Managing Committee consisting of:—

(a) A Branch Chairman, a Branch Secretary-Treasurer, and not less than three other members, all to be known as elected members and to be ballotted for by all members of the Branch entitled to vote at Branch elections.

(b) Those members of Council resident within the jurisdiction of the Branch to be known as ex-officio members, and

(c) The immediate Past Chairman and the immediate Past Secretary-Treasurer of the Branch, to be knownas members emeriti, these latter to be members for only the year immediately following their term of office."

Committee on Policy Meeting

As announced in the last issue of *The Journal*, the meeting of the Committee on Policy was held at Headquarters on April 11th and 12th, presided over by J. B. Challies, M.E.I.C., Chairman of the Committee with A. B. Lambe, A.M.E.I.C., Secretary. The following members of the committee were present:—Messrs. A.R. Decary, Walter J. Francis, C. C. Kirby, A. J. McPherson, Wills MacLachlan, Brig.-Gen. C. H. Mitchell, A. B. Normandin, F. H. Peters, K. H. Smith, W. G. Swan, J. G. Sullivan, K. B. Thornton, W. P. Wilgar, R. O. Wynne-Roberts and the Secretary of *The Institute*.

Serious deliberation was given to the agenda, which included consideration of the objects of *The Institute*, its relation to cognate bodies, its organization under the headings of membership, council and general, in addition to special matters relating to the welfare of *The Institute*.

The result of the two days' deliberation will be embodied in a report to the Council of *The Institute*, and it is hoped that the entire membership will be advised, through *The Journal*, of the resolutions passed and informed of the important results achieved.

Gzowski and Plummer Medals

In the last issue of *The Journal* an illustration was given of the Leonard Medal. In view of the fact that the Gzowski Medal has been re-designed and a newly designed Plummer Medal accepted, illustrations of both these medals are shown herewith.

All the medals of *The Institute* are handsome in appearance, the illustrations not permitting a proper appreciation of their beauty.

Employing Engineering Students

Back in the active days a decade ago and preceding that for another decade the engineering students at the various universities found no difficulty in obtaining employment during the summer months. In fact, jobs or positions as the case might be were available for all and with little effort on the part of the students themselves. To-day an entirely different situation obtains and a serious problem confronts many of the young men who find it necessary to add to their resources in the summer sufficient to enable them to continue their courses during the following year as well as those who wish to obtain additional practical experience.

It is highly desirable, therefore, that every assistance be given our student members in getting them placed for the summer where they may earn and learn. After considering the problem, the Council of *The Institute* resolved that all members in a position to employ technical men should be requested to lend every assistance and to give employment to as many students during the summer as possible. It was also suggested that when employing engineers for any position, the applicants be asked to what grade of membership in *The Institute* they belong.

Membership in *The Institute* to-day stands for something definite and tangible and the desirability and value of membership will be greatly enhanced by the adoption and steady adherence to a policy such as is embodied in this proposal.

OBITUARY

Captain Louis William Klingner, M.E.I.C.

Captain Louis William Klingner, M.C., M.E.I.C., met a tragic death by drowning, in the Tigris river, word of which was received in Canada on April 13th, by cable, from the Department of the Secretary of State for India. The late Captain Klingner was born at Toronto on June 10th, 1886, and graduated from the University of Toronto in 1907, which was followed by a post-graduate course in reinforced concrete at Columbia University, New York, during 1909 and 1910, at which time he was detailer and checker of structural steel and reinforced concrete design for the engineering department, New York City. This was followed by the position of superintendent of construction, with the Foundation Company of New York, during 1910 and 1911. Returning to Canada, the late Captain Klingner became resident engineer of the Canadian Pacific Railway Company on construction of a double track at Perth, Ont. The years 1913 and 1914 were spent as company engineer with the Dominion Construction Company at Toronto.

Captain LOUIS WILLIAM KLINGNER, M.C., M.E.I.C.

At the outbreak of the war the late Captain Klingner enlisted, his record being continuous from September 1914, to July 1919. Enlisting as a Lieutenant with the 2nd Field Company, Canadian Engineers, he was engaged in instructing and training Infantry in field works and military engineering at Toronto. From April, 1915 to December 1915, he was in charge of construction work at Niagara camp; from December 1915 to March 1916 was with O.C. Depot Company at Engineers Training Depot, Ottawa; and from March 1916 to July 1918 he was with the 8th, 11th, and 10th Field Companies, Canadian Engineers, in England. From August 1916 to

May 1918 he was Lieutenant in the 10th Field Company, Canadian Engineers, in France; May 1918 to August 1918, Captain 10th Battallion, Canadian Engineers, and August 1918 to July 1919 Staff Captain, 4th Brigade, Canadian Engineers. Captain Klingner was awarded the Military Cross on November 16th, 1916, for exceptional courage in bringing in, under enemy fire, at the Somme a wounded Canadian officer. In this exploit he risked his own life, without hesitation, to save that of a comparative stranger. He was demobilized on July 6th, 1919.

On returning to Canada, the position of company engineer and comptroller of the International Corporation of Canada, Montreal, was given to him, and in 1920 he was appointed district irrigation officer in charge of all irrigation surveys in Mesopotamia, with the Irrigation Directorate, Bagdad, Mesopotamia, having under his control eighty-four local officers with parties in field. While making a trip from Bagdad to his Serrai headquarters, his motor launch was swept, by the swollen waters of the Tigris river, against a bridge pier, with such force that it was crushed and sunk in twenty seconds. The news of the death of Captain Klingner came as a severe shock to his many friends in this country, to whom his loss is irreparable. It will be difficult to find, combined in one person, such a generous nature, such sterling character and high ideals.

Joining as a Student in 1907, Captain Klingner was transferred to Associate Membership in 1912, and on January 17th, 1922, was elected to Membership in *The Institute.*

PERSONALS

Alan Timbrell, A.M.E.I.C., is now located at Simcoe, Ont., with Ontario Department of Public Highways.

D. T. Main, M.E.I.C., is with the National Steel Car Corporation, Limited, at Hamilton, Ont.

Lt.-Col. A. G. T. LeFevre, D.S.O., M.E.I.C., formerly of Antofa Gasta, Chile, is now with the Borax Consolidated Limited, Arequipa, Peru.

A. E. Woollam, A.M.E.I.C., formerly of Montreal, has accepted a position with the Wayagamack Pulp and Paper Company, Three Rivers, Que.

G. K. Waterhouse, Jr.E.I.C., who was formerly located at Kingston, is now with the Canadian Paperboard Company, at Frankford, Ont.

B. H. Segre, A.M.E.I.C., is on the staff of the Topographical Surveys Branch, Department of the Interior, in Ottawa.

John Rankin, A.M.E.I.C., is with the Department of Railways and Canals, at the Welland Ship Canal office, St. Catharines, Ont.

L. N. Boulet, A.M.E.I.C., formerly of Montmagny, is now with the Department of Public Works, Post Office Building, Quebec.

G. L. Hall, A.M.E.I.C., until recently of Isle Verte, Que., is now with the Department of Public Works, Post Office Building, Quebec.

R. McKillop, A.M.E.I.C., has been transferred by the Canadian Pacific Railway Company from London to Toronto.

H. J. Whiting, Jr.E.I.C., formerly with the Brompton Pulp and Paper Company, has accepted a position as resident engineer on road construction with Newton and Dakin Construction Company, Montreal, Que.

B. W. Paget, A.M.E.I.C., formerly of Niagara Falls, is now resident engineer on the James Bay extension, of the Temiskaming and Northern Ontario Railway, at Cochrane, Ont.

C. B. R. Macdonald, A.M.E.I.C., who has for some time been on construction work in Belgium, has now returned to England, his address being, Capel House, 54 New Broad Street, London, E.C.2.

Gordon L. Shanks, A.M.E.I.C., after spending the past year in Mexico on construction work with The Foundation Company has recently been appointed municipal engineer for Rockwood municipality near Winnipeg, Man.

F. W. Douglas, A.M.E.I.C., until recently assistant superintendent for the Foundation Company, at Mattamuskeet Lake Drainage, New Holland, Hyde County, North Carolina, has been transferred by that company to South Portland, Maine.

John G. Sullivan, M.E.I.C., President of *The Engineering Institute of Canada*, has been invited to report on the engineering features of the Pacific Great Eastern Railway which is owned by the Government of the Province of British Columbia.

David B. McLay, M.E.I.C., formerly of Vancouver, B.C., is still in Singapore, Straits Settlement, with W. Mansfield and Company, Ltd., and is at present engaged in the erection of a five-story office building. Mr. McLay contemplates revisiting Canada some time next year.

R. A. Ross, M.E.I.C., consulting engineer, of Montreal and M. J. Haney, M.E.I.C., of Oakville, Ont., have been appointed members of the Royal Commission recently established by Premier Drury for the purpose of reporting upon the affairs of the Hydro-Electric Power Commission of Ontario.

N. G. McDonald, Jr.E.I.C., has resigned his position as town engineer of Oshawa, Ont., and has accepted a position with Gore, Naismith and Storrie, consulting engineers, Toronto. During the period that he was town engineer, Mr. McDonald was in charge of several important undertakings.

S. W. Sawin, Associate Member of the American Society of Civil Engineers, was an interested guest at a recent luncheon of the Ottawa Branch. Mr. Sawin is a graduate of Dartmouth College and has been in Ottawa during the winter advising in the readjustment of the affairs of one of the Capitals' leading industrial concerns.

Andrew Galloway, A.M.E.I.C., formerly on the staff of the city engineer of Victoria, B.C., has been appointed business representative of *The Engineering Journal* in

Great Britain. Mr. Galloway is also prepared to supply information regarding engineering problems, or conditions in Europe to members, upon request. His business address is:—16 Ravelston Park, Edinburgh, Scotland.

Wm. H. Carson, M.E.I.C., district engineer in teh province of Ontario, for the Department of Marine, Ottawa, at the ordinary meeting of the Council of the Institute of Civil Engineers, Great George Street, Westminster, S.W.1., England, held on March 7th, 1922, was transferred from the class of Associate member to Member, (M.Inst.C.E.)

Colonel J. S. Dennis, M.E.I.C., C.M.G., of Montreal, chief commissioner of colonization and development for the Canadian Pacific Railway, has been asked by the provincial government of British Columbia to conduct an investigation into the resources and settlement possibilities of the country along the Pacific Great Eastern Railway.

President J. G. Sullivan and Secretary Fraser S. Keith, attended the spring meeting of the American Society of Civil Engineers at Dayton, Ohio, on April 5th to 7th. The first paper on the programme of the professional meeting was given by President Sullivan, "Flood Conditions in Canada". He also conveyed fraternal greetings on behalf of *The Institute* to the members of our sister Society in the United States.

A. W. Swan, B.A.Sc., Jr.E.I.C., for two years and a half on the Headquarters staff of *The Institute* as assistant editor of *The Journal*, sailed on the "Melita" for England on Saturday, April 15th. After receiving his education at Toronto University and acquiring considerable Canadian experience, technical, editorial, and business, Mr. Swan decided to take up his residence in England where his parents reside. During his stay in Montreal, Mr. Swan was active in musical circles and in boys' work. He takes with him the good-will of a large circle, who are interested in his success in his new field.

A. M. Snider, Jr.E.I.C., has resigned his position with the Canadian Ingersoll Rand Co. Ltd., of Sherbrooke, Que., to become assistant general manager of the Waterloo Manufacturing Company Ltd., of Waterloo, Ont. Mr. Snider who is an honours graduate in mechanical engineering of the University of Toronto has been with the Canadian Ingersoll Rand Company since graduation in 1917, first as assistant to the production engineer and for the last three years as production engineer. On leaving Sherbrooke, Mr. Snider was presented with a gold watch as a mark of appreciation by the staff and employees of the Canadian Ingersoll Rand Company.

With the permission of the Deputy Minister, Mr. J. G. Desbarats, C. M. G., M.E.I.C., and under the immediate supervision of Lt. Commander C. P. Edwards, M.E.I.C., superintendent of the Radio Branch of the Naval Service, concerts are broadcasted from the radio station on Vittoria Street, Ottawa. Members of the engineering profession are welcomed by the genial Commander every Thursday evening, when the concerts which are broadcasted from Schenectady, New York, and other important stations in the United States are received. A number of interesting addresses have recently been listened to at this station in Ottawa, among which was the address by Dr. Steinmetz.

D. M. Mathieson, M.E.I.C., of Toronto has completed arrangements for an extended tour of the Orient as representative of ten Canadian manufacturers. The lines which will be handled by Mr. Mathieson are chiefly of a mechanical nature including engines, pumps, boilers, roadmaking machinery, agricultural implements etc., although leather and paper goods are also included. Mr. Mathieson will visit London, Yokohama, Kobé, Tientsin, Shanghai, Hong Kong, Singapore, Bankok, Batavia, Colombo, Madras, Calcutta and Bombay and at each port of call will establish a Canadian representative to develop trade in the Canadian products which he represents. It is anticipated that Mr. Mathieson will be absent about a year on this initial tour.

Survey Pioneering

William Pearce, M.E.I.C., of Calgary, pioneer land surveyor of the West, was the guest of the Dominion Land Surveyors, at a luncheon on March 30th, and gave a very interesting talk on his early experiences. G. H. Herriot, M.E.I.C., president, occupied the chair, and at the table with him were Dr. Deville, C. A. Magrath, M.E.I.C., R. A. Davy, M.E.I.C., Thos. Shanks, Noel J. Ogilvie, M.E.I.C., and F. H. Peters, M.E.I.C.

Mr. Pearce's reminiscences carried him back to 1873 when he was employed on a timber limit on the Severn river. He had to carry a pack of 60 pounds and walk on snowshoes for the first time. Continuing, he told of his work in the Department of the Interior until superannuated in 1904. Since then he has been connected with the C.P.R. at Calgary.

New Assistant at Headquarters

N. E. D. Sheppard, B.A.Sc., A.M.E.I.C., has been appointed Assistant to the Secretary on the Headquarters staff of *The Institute*. As assistant editor of *The Journal*,

N. E. D. SHEPPARD, B.A.Sc., A.M.E.I.C.,
Assistant to the Secretary of The Institute.

Mr. Sheppard will have charge of its production, and as office manager, he will be in charge of the Headquarters staff and have the responsibility for the efficient handling of the routine business of *The Institute.*

Mr. Sheppard was born at Ottawa on the fifteenth of January, 1891, and graduated with the degree of B.A.Sc., from the Faculty of Applied Science, University of Toronto, in 1914. During the summers of 1908, 1911 and 1913 he was employed on survey work, and following graduation was appointed to the staff of the Dominion Water Power Branch as assistant to chief hydraulic engineer on water power investigation. In 1916 he was transferred to Nova Scotia as assistant to the district engineer of the Dominion Water Power Branch engaged on power investigation under the co-operative agreement between the Federal Government and the Government of the Province of Nova Scotia. From 1917 to 1920 he was engaged at the head office of the Dominion Water Power Branch, under the assistant director, on the preparation of the Directory of Central Electrical Stations in Canada and on a detailed study and analysis of the central electrical industry in Canada. In 1920 Mr. Sheppard resigned from the Dominion Water Power Branch to accept a position with the Riordon Company Limited at Hawkesbury as secretary of the vice-president and technical director, returning to the Dominion Water Power Branch in 1921.

Mr. Sheppard was admitted as a Student of *The Institute* on April 11th, 1914, and transferred to Associate Membership on August 1st, 1916.

Admitted in Eighty-first Year

That there is no maximum age limit for admission to *The Engineering Institute of Canada* is demonstrated upon the fact that one of the members just elected, whose picture appears herewith, Robert Angus, consulting engineer of London, Ontario, was 80 years of age on the 11th of January last.

ROBERT ANGUS, M.E.I.C.

Mr. Angus was apprenticed as a machinist to E. Leonard, founder of the present manufacturing establishment of E. Leonard and Sons, London, Ont., before the majority of the present members of *The Institute* were born, in the year 1865. Ten years later finds Mr. Angus engaged on the design, construction and installation of waterworks for the town of Sarnia. For the period between 1876 and 1890 Mr. Angus was engaged in the design and construction of steam engines for E. Leonard and Sons, where he became superintendent in 1891. At the World's Fair in Chicago in 1894, Mr. Angus received the diploma of honourable mention for skill as a designer of steam engines. In 1918 Mr. Angus was made a life-member of the American Society of Mechanical Engineers. In London where he is well known he is held in the highest esteem and the hope is expressed that he may long be spared to enjoy his membership in *The Engineering Institute of Canada.*

EMPLOYMENT BUREAU

AND

MEMBERS' EXCHANGE

To make this department more valuable it is proposed that in future advertisements of situations vacant should state salary, and give details of requirements.

Situations Wanted

Civil Engineer

Civil engineer, A.M.E.I.C., and graduate land surveyor open for a position at once. Experience eleven years of railroad location and construction, two years of highway construction and six years of private practice, municipal engineering etc. For personal reasons want a change and would be very reasonable about salary. Apply Box No. 99—P.

Mechanical Engineer

Mechanical engineer, A.M.E.I.C.; age 29; B.Sc; seven years experience on machine design and construction work. Open for engagement about May 1st, as mechanical engineer with machinery manufacturing firm or allied work, preferably in Ontario or Quebec. Salary $275.00 per month. Apply Box No. 100-P.

Engineer

Engineer, B.Sc., McGill, 1920, Jr.E.I.C., age 24, single. Overseas service. Experienced in paper mills. At present on McGill staff. Available end of June. Apply Box 96-P.

Draughtsman

Draughtsman, young man, now employed, but desires a change with opportunity for advancement and a broader experience in draughtsmanship. Over four years' experience, chiefly sketching, drawing and tracing of spare parts for repairs to machinery. Location immaterial. Can furnish excellent references, also sample drawings. Apply Box 97-P.

Civil Engineer

McGill University graduate 1910, A.M.E.I.C. Married, age 32. Nine years experience in charge of railway location and construction. In charge of railway company overseas. Two years experience as manager of large industrial plant. Would like position with firm of contractors or with industrial plant. Apply Box 98-P.

Manager

Executive or management, construction or manufacturing. Extensive experience with labour, estimating, costing. Wishes to change position for personal reasons only. Apply Box 95-P.

Structural Engineer

Structural engineer, A.M.E.I.C. and M.R.A.I.C., age 32, experienced in general building design and construction, including reinforced concrete grain elevators, mills and industrial buildings, good business training, desires position with consulting engineers, architects or contractor or would consider position with manufacturers sales organization, which would show possibilities for advancement. Available immediately, full particulars of experience and references reply to. Box No. 101-P.

Situations Vacant

Canadian Representatives in the Orient

The advertiser, the accredited representative in the far East of important Canadian manufacturers of agricultural implements, engines, pumps, roadmaking machinery and kindred lines, desires to interview men of high character and integrity who would undertake to act as resident managers of established branches in the Orient. Beyond the usual qualifications of a successful salesman a knowledge of the construction and application of the products to be marketed is essential. Civil or Mechanical Engineering training and experience is particularly desirable. Preliminary expenses must be borne by managers to and in assigned territory. The opportunity is offered for an excellent opening in foreign markets to men who can meet the requirements of the work.

If interested, write for appointment for interview, stating qualifications and giving full details of experience to Major D. M. Mathieson, M.E.I.C., 205 Confederation Life Building, Toronto, Ont.

Chief Traffic Officer

A Chief Traffic Officer for the Board of Railway Commissioners, Ottawa, at a salary of $6,500 per annum.

Duties.—To be responsible under the Board of Railway Commissioners, for the conduct of all traffic matters involving rates and practices pertaining to the service of railway, express, telegraph, and telephone companies; to direct the work of the traffic branch of the Board of Railway Commissioners; to investigate and prepare important reports to advise the Board on traffic matters; and to perform other related work as required.

Qualifications.—Education equivalent to graduation from a university of recognized standing; at least five years of experience in an administrative and construct ive capacity in an important railway freight or traffic department; wide knowledge of the structure, classification and application of railway freight and passenger tariffs; ability to meet and discuss traffic matters with railway and public service officials; executive ability of a high order. While a definite age limit has not been fixed for this competition, age may be a determining factor when making a selection.

Examination.—A rating on Education and Experience will be given from the sworn statements submitted by applicants on their application forms. To those who qualify, an oral examination may be given if necessary.

Foresters

Foresters at an initial salary of $1,680 per annum, which will be increased upon recommendation for efficient service at the rate of $120 per annum, until a maximum of $2,100 has been reached; with house or allowance in lieu thereof not to exceed $20 per month. This initial salary may be supplemented by whatever bonus may be provided by law.

Duties.—Under direction, to plan and supervise improvements on a forest reserve; to keep records, make reports, and handle detailed clerical work involved; to make surveys and inspections; to prepare estimates, maps, and plans; to classify forests and estimate quantities; to inspect and investigate forest operations, such as fire prevention, lumbering, scaling and the enforcing of forest regulations; to collect forest tree seed; to inspect privately-owned timber tracts upon request and advise owners in regard to handling forests; to assist in experimental work; and to perform other related work if required.

Qualifications.—Education equivalent to graduation in forestry from a college of recognized standing; experience in mapping and describing forest types; supervisory ability; good physical condition. Candidates must be 21 and not more than 45 years of age on May 11, 1922.

A rating on Education and Experience will be given from the sworn statements submitted by applicants on their application forms. To those who qualify, an oral examination may be given if necessary.

A list of eligibles will be established to fill the vacancies in the above class in British Columbia and Alberta.

General Directions

According to law a special preference is given first, to candidates who are in receipt of a pension on account of disability received as a result of war service and who have not been successfully re-established, and secondly, to candidates who have been on active service overseas and who are found to possess the minimum qualifications for the position. The age limit does not apply to such candidates.

Except in the case of positions at Ottawa, preference in appointment is given to residents of the districts where the vacancies occur.

Application forms properly filled in must be filed in the office of the Civil Service Commission not later than May 11. Application forms may be obtained from the office of the Employment Service of Canada, or from the Secretary of the Civil Commission.

By order of the Commission,

W. Foran,
Secretary.

Members' Exchange

For Sale

Report of 7th International Congress of Applied Chemistry. Report of 8th International Congress of Applied Chemistry, Volumes 1 to 27. Transactions of the Electro Chemical Society, from 1902 to 1914 inclusive. Apply Box 23—A.

List of Students at McGill University requiring summer employment.

Name	Year	Experience	Work wanted
Arnold, F. M.	I and II	Chemical analysis and metallography	Metallurgical work; specialty electric work.
Chalker, C. R.	I	Marine motor engines operation	Motor engines.
Coulbourn, A. P. R.	I	Apprentice to shipyard management; drafting; fitting shop, etc.	Any position, Montreal preferred.
Darker, W. H.	I	None	Electrical work.
DeLorimier, A. F.	I	None	Field work or anything that offers.
Gray-Donald, E.	I	Office work, road construction and repairs; building construction; levelling; water supply	Surveying.
Howe, R. W.	I	Farm work; checker on wharf; ship steward's clerk	Forest ranger; work out of doors.
Jarvis, R. C. B.	I	Electrical operator in charge of motor generator sets	Electrical work.
McCuaig, E. B.	I	Road construction; surveying	Surveying.
Miller, J. J. H.	I		Electrical work.
Shore, F. S.	I	Mechanic's helper and checker; ship yards	Surveying; forest ranger.
Nelligan, J. B.	I		Surveying.
Whitehead, J. G.	I	Chainman; mechanic; salesman	Mechanical shopwork or salesman.
Campbell, F. R.	II	Construction work in hydro-electric development	Construction work or drafting office.
Dick, G. M.	II	Pattern-maker; draftsman on tools and equipment	Engineering work.
Draper, J. M.	II	Rodman, taking levels for dams and running contours of lakes and rivers	Outside work, preferably instrument man.
Farnworth, G. J.	II	Shopwork on repair and erection of locomotives; electric and gas welding; surveying	Immaterial; in or near Montreal.
Finlayson, A. W.	II	Bank clerk and office assistant	Engineering work.
Gravel, A. L.	II		Surveying or mechanical work.
Harris, A. N.	II	Mechanical draftsman	Mechanical work.
Kirschberg, A. A.	II		Electrical work.
McEwen, D. W.	II	G.T.R. Arbitration Board, Engineering Dept.; Inspector of Good Roads	Clerkship or technical work in metallurgical plant.
Malkevitch, A.	II		Chemical laboratory work.
Mitchell, W. M.	II	Office work, surveying	Surveying or construction work.
Shaw, G. E.	II	Structural drafting and assembling	Drafting on structural steel; surveying.
Shlakman, V.	II	Salesman, shipper, stock-keeper, cashier, book-keeper, farm worm	Surveying or electrical work.
Smith, M. K.	II	Marine fitter's helper; clerical work	Clerical or engineering work.
Stewart, D. L.	II	Inspecting on fine limit and gauge work, charge of wharf office	Drawing office or shopwork.
Warren, W. A.	II		Electrical, mechanical or chemical.
Weisburgh, C.	II		Electrical work.
Mercier, A.	II	Clerical	Electrical work.
Taylor, M. B.	II	Chemical engineering work	Chemical work.
Bleau, A.	III	Foundry work, wiring, drafting, chainman	Metallurgical work.
Bown, W. E.	III	Steel mill and coke ovens	Industrial work.
Chisholm, J. D.	III	Machine work, instrumentman	Electrical work.
Cooper, P. E.	III	Instrumentman	Engineering work, (railway or structural).
Cossitt, L. S.	III	Machinist helper	Machine shop or drafting office.
Fagan, J. W.	III	Clerical experience	Mechanical engineering.
Friedman, V. E.	III	Machine work and inspection	Mechanical.
Gilbert, E. V.	III	Instrumentman	Highway construction.
Griffith, T. R.	III	Railway office work	Chemical work.
Goldberg, H. J.	III	Chainman; helper	Electrical work.
Harbert, E. T.	III		Drafting or shopwork.
Mitchell, J. M.	III & IV	Operation of acetic stills, asphalt testing	Chemical work.
Rainnie, R. J.	III	Machine and foundry work; bridge construction	Construction work.
Scott, J. M.	III	Electrical wiring and installation	Mechanical work.
Shier, B. B.	III	Power transmission construction; clerical and inspection work	Electrical construction work.
Velasco, F. M.	III	Mechanical drafting; surveying	Mechanical work.
Vrooman, H. W.	III	Work in salt laboratory	Chemical laboratory work.
Williams, S. W.	III		Chemical work.
Simpson, J. C.	III	Rodman and chainman	Outside work.
Black, H. M.	IV	Shopwork; wooden machinery	Automobile manufacturing concern or drafting.
Cartwright, G. H.	IV	Rodding; transmission line inspection; overseas	Will go anywhere.
Cousineau, C. A.	IV	Instrumentman	Civil engineering work.
Delaney, W. V.	IV	Topographical surveying	Hydraulic pertaining to hydro-elect. development.
Eager, N.	IV	Draftsman	Construction work.
Gurman, I.	IV	Machine repair shop	Chemical engineering.
Holmes, E. E.	IV	Shipyard shops; marine engineering; fire prevention	Any position, preferably in Montreal.
Irving, G. E. L.	IV	Pulp and paper mill operation; machine shop; rodman and chainman	Assistant chemist.
Johnson, E. L.	IV	Machine telephone shop; cost accounting	Production or industrial engineering.
MacNider, C. H.	IV	Drafting, electrical works	Engineering work.
Martin, K. B.	IV	Instrumentman; demonstrating automobiles	Railway or hydro-electric construction.
Mitchell, R. J.	IV		Electrical work.
Wait, E. H.	IV	Automobile assembling	Metallurgical work.
Woolward, C. D.	IV	Instrumentman	Construction or instrument work; drafting.
Handy, Lee	IV		Electrical engineering work.
Kerr, G. E.	IV	Transformer winding and general electrical work	Electrical work.
Simons, J. J.	IV	Helper electrical wiring and station operating	Electrical work.
Spratt, M. J.	IV	Resident engineer on road construction; instrumentman; geodetic survey	Construction or design of structures.

Elections and Transfers

At the meeting of Council held on April 18th, 1922, the following elections and transfers were effected:—

Members.

Robert Angus, consltg. engr., London, Ont.

John Dow, plant chief, Alberta Govt. Telephones, Lethbridge, Alta.

Alonza Clarence Selig, district engr., C.N.R. Eastern Lines, Maritime District, Moncton, N.B.

Joseph Emile St. Laurent, C.E. (Ecole Polytechnique), district engr., Dom. Public Works Department, Winnipeg, Man.

Ellwood Wilson, B.Sc. (Univ. of the South), mgr., Forestry Division, Laurentide Company, Grand Mere, Que.

Associate Members.

William Robert Alder, B.Sc. (Queen's Univ.), asst. res. engr., Dept. Public Highways, Ontario, Cornwall, Ont.

Albert Foster Baird, M.Sc. (Univ. of N.B.), professor of physics and electrical engr'g., Univ. of New Brunswick, Fredericton, N.B.

Gerald Lethwyn Bockus, supt. of power, City of Sherbrooke, Que.

Claude Hugh Brabazon, Geodetic Survey of Canada, Department of the Interior, Ottawa, Ont.

Bertram Edward Bury, Instr'man., Lesser Slave River survey, Public Works Dept., Dom. Govt., Edmonton, Alta.

Marcus Dow Cadwell, city engr. and supt. of municipal utilities, North Battleford, Sask.

Norman Keith Cameron, (Grad. R.M.C. Kingston), in charge of concrete work for the St. John Dry Dock and Shipbldg. Co., St. John, N.B.

Stanley W. Canniff, test engr., Ottawa Hydro-Electric Commission, Ottawa.

Frank James Clark, res. engr., Lethbridge Northern Irrigation District, Lethbridge, Alta.

Stanley Herbert Cunha, B.Sc. (McGill Univ.), elect'l. engr., engr'g. dept., Montreal Light Heat & Power Company, Montreal, Que.

John Clinton Donald, gen. mgr. and chief engr., B.C. & Alta. Power Co. Ltd., Fernie, B.C.

Owen William Ellis, M.Sc. (Birmingham Univ.), lecturer on metallography and on iron and steel. University of Toronto. Also consltg. metallurgical engr., Toronto, Ont.

Reginald Hugh Field, Surveys Laboratory, Department of the Interior, Ottawa, Ont.

Joseph Arthur Forgues, C.E. (Ecole Polytechpique), reinforced concrete detailing engr., Montreal Water Board, Cartierville, Que.

George Frederick Herbert Hilliard, (Grad. R.M.C. Kingston), res. engr., Lethbridge Northern Irrigation District, Lethbridge, Alta.

Homer Pasha Keith, C.E. (Univ. of Toronto), D.L.S., A.L.S., district highways engr. at Lethbridge, Province of Alberta, Lethbridge, Alta.

C. Camille Lessard, B.S.A. and C.E. (Laval Univ.), private practice with C. E. Gauvin, C.E., Quebec, Que.

Nathaniel Marshall, inspr. of boilers, Alberta Government, Lethbridge, Alta.

Henry John Gisborne McLean, Brantford, Ont.

William Jeffrey Moffat, (Grad. R.M.C. Kingston), asst. engr., Dept. of Highways, Regina, Sask.

John Mackenzie Moore, consltg. engr. and architect, London, Ont.

James Cundiff Nash, B.A.Sc. (Univ. of Toronto), elec. dftsman., Canadian Westinghouse Co., Hamilton, Ont.

Thomas Herbert Nicholson, executive engr., under N. M. Lash, chief engineer, Bell Telephone Company, Montreal, Que.

Harvey Arnold Smail, B.Sc. (Queen's Univ.), res. engr., Department Provincial Highways, Kingston-Perth, Kingston, Ont.

Gerald Bradley Snow, B.Sc. (Univ. of Toronto), asst. engr. with J. F. Grenon, Quebec Chibougaman Rly., Chicoutimi, Que.

John Henry Summerskill, B.Sc. (McGill Univ.) Riordon Co., Ltd. Montreal, Que.

Juniors.

Herbert Aldous, of Toronto, Ont.

John William Gamble Boyd, of Toronto, Ont.

Melville Grant Henderson, B.A.Sc. (Univ. of Toronto), Lethbridge Northern Irrigation District, Lethbridge, Alta.

Kenneth MacKenzie, B.Sc. (N.S. Tech. Coll.), engr'g. staff, publicity dept. Canada Cement Company, Winnipeg, Man.

Frank Leslie Mitchell, B.Sc. (McGill Univ.), research dept., service division, Abitibi Power & Paper Co., Iroquois Falls, Ont.

Alexander Thomson, dftsman, Lethbridge Northern Irrigation District, Lethbridge, Alta.

Associates.

Arthur John Ames, managing director ,"Instruments Limited", Ottawa, Ont.

Joseph Octave Massicotte, professor of technology, in charge of elect'l. test and laboratory, Montreal Technical School, Montreal, Que.

Transferred from the Class of Associate Member to that of Member.

Henry Arthur Brazier, city engineer, London, Ont.

James Leonard Busfield, B.Sc. (London Univ.), principal asst. to Walter J. Francis & Company, Montreal, Que.

Charles Walter Cornell, C.E. (Univ. of Toronto), district engr. of county roads, Prov. of Ontario, Toronto, Ont.

Frederick Alfred Dallyn, B.A.Sc. (Univ. of Toronto), director of sanitary engr'g. divn., Prov. Board of Health of Ontario, Toronto, Ont.

Edward Ewon Hawkins, outside supt. of constrn., reinforced concrete work, Port of Bristol, for Messrs. W. Alban Rickards & Co., Avonmouth, England.

Colin Dugald McTavish MacKintosh, supt., Lethbridge Divn., C.P.R., Lethbridge, Alta.

Patrick Philip, public works engr., Province of British Columbia, Victoria, B.C.

Herbert Thomas Routly, (Univ. of Toronto '06), private practice as contractor, Toronto, Ont.

Albert Ernest Sharpe, asst. engr., C.P.R. Winnipeg, Man., at present at Leader, Sask.

Athol C. Wright, asst. hydraulic engr., Reclamation Service, Dept. of the Interior, Ottawa, Ont.

Transferred from the Class of Junior to that of Associate Member.

David Cecil Mines Davies, asst. engr., Dept. of Highways, Regina, Sask.

Frank Parkin Flett, B.Sc. (Univ. of N.B.), mgr. sash and engr'g. dept., Trussed Concrete Steel Co. of Canada, Walkerville, Ont.

Sifroy Goulet, chief mech. dftsman. and asst. to mech. engr., Can. Gen. Elec. Co., Peterborough, Ont.

Pierre Maxime Henri LeBlanc, C.E. (Laval Univ.), D.L.S., Topog'l. Surveys Branch, Department of the Interior, Ottawa, Ont.

Ernest Norman Lyon, asst. engr., Indian Constrn. Co., Bombay, India.

Norman Geddes McDonald, (Univ. of Toronto), town engr., Oshawa, Ont.

Robert Cleland McKnight, (Grad. R.M.C. Kingston), B.C.L.S., county engr., Grey County, Owen Sound, Ont.

Francis George Rounthwaite, B.Sc. (McGill Univ.), gen. supt., The Bermuda Development Co., Tucker's Town, Bermuda.

Frederick Charles Rust, asst. to res. architect, Toronto Harbour Commissioners, Toronto, Ont.

Donald Alexander White, (Grad. R.M.C. Kingston), president, Taylor, White & Co. Ltd., Manufacturers Agents, Montreal, Que.

George Howard Wood, B.A.Sc. (Univ. of Toronto) asst. hydraulic engr., Reclamation Service, Dept. of the Interior, Ottawa, Ont.

Transferred from the Class of Student to that of Associate Member.

John Smythe Hall, B.Sc. (McGill Univ.), night locomotive foreman, C.P.R., London, Ont.

Transferred from the Class of Student to that of Junior.

Despres Dessane, asst. engr., Quebec Roads Commission, Quebec Que.

Eudore Giguere, C.E. (Laval Univ.), chemist-analyst of the City of Montreal, Lachine, Que.

Robert William Jickling, B.Sc. (Univ. of Man.), testing and inspecting overhead distribution system etc., City of Winnipeg Hydro-Electric System, Winnipeg, Man.

W. Bryce MacIntyre, B.A.Sc. (Univ. of Toronto), in charge of sewer design, Barber, Wynne-Roberts & Seymour, Toronto, Ont.

Hubert David Rogers, B.Sc. (Queen's Univ.), supt., Gananoque Waterworks & Sewerage System, Gananoque, Ont.

BRANCH NEWS

Victoria Branch

H. M. Bigwood, A.M.E.I.C., Secretary-Treasurer.

Visit of Vancouver Branch Chairman

A very profitable meeting of the executive was held on the 13th, when C. Brakenbridge, M.E.I.C., the Chairman of the Vancouver Branch attended and took part in the discussions. His interpretation of the point of view of his executive was of material assistance to the members present and helped to create an atmosphere suitable to proper co-operation between the Branches on several matters jointly affecting them. It is hoped that a practice so fruitful of good results will be oft repeated and every opportunity presenting itself made use of by members of either executive attending meetings of the other Branch and thus broaden the viewpoint of all concerned.

The question of holding a Western Professional Meeting of *The Institute* during the same week in which the Good Roads Association will hold their convention in Victoria is being taken up in an active manner. As previously promised the Branch will fall into line and support the Vancouver Branch in sponsoring such a meeting should they be able to arrange it.

Besides those interested in engineering matters who will attend the Good Roads Convention and who will be on the spot for a professional meeting of *The Institute*, it is hoped that the annual convention of District Engineers in the Provincial Public Works Department will also be held about the same time thus enabling them to be present both at the Roads meet and *The Institute* gathering. It will afford them an excellent opportunity to come into close personal touch with *The Institute*.

Another matter which is receiving attention is the advisability of putting the Provincial Division in a position to function. The division was organized some years ago but did not act and it is thought that probably the time has arrived when it may profitably do so. Opinions are being canvassed to this end.

Syria

F. G. Aldous, A.M.E.I.C., delivered a lecture on the 16th to only a small audience unfortunately, the subject being "A surveying expedition into Syria from Damascus to Aleppo", a number of excellent lantern slides being shown. The work of the expedition though primarily undertaken for military purposes, afforded opportunities of which the speaker had taken full advantage for obtaining pictorial records of the country passed through. The country being 'steeped in antiquity' and most names of places being found mentioned in the bible, it is said that some members are renewing their studies of the old testament with added interest.

The lecture was well prepared and the technical points relative to the survey proper were not lost sight of while the sidelight on eastern life as lived for a thousand years and more was decidedly interesting.

During the coming month an opportunity will be afforded members of visiting the dry-dock under construction at Esquimalt and an evening will be devoted to a description of the work before the visit is made.

Edmonton Branch

R. H. Douglas, A.M.E.I.C., Secretary-Treasurer.

The regular monthly meeting of the Edmonton Branch was held in the Edmonton Board of Trade Rooms on Wednesday March 15th, at 8 p.m.

The Branch, by resolution, went on record as approving the proposal to establish an Industrial and Technical Research Institute at Ottawa.

W. E. Roe, A.M.E.I.C., of the Canadian National Railways, gave a very interesting and instructive paper on "Railway Maintenance", describing the various problems a maintenance engineer has to contend with. Professor R. S. L. Wilson led in the discussion following the paper, also giving some personal experiences in railway work.

Dr. Boyle, Dean of the Faculty of Applied Science of the University of Alberta, gave an address on "Engineering Education", pointing out that the tendency of engineering education should be more towards the old apprenticeship system and that summer work, in the branch of engineering being studied, should be made a compulsory qualification for a degree.

Alex. Stewart, A.M.E.I.C., led in the discussion following and said it was his experience that engineering parties were often made up of students other than science men. After further discussion it was suggested by C. A. Robb, A.M.E.I.C., that steps be taken to ask engineering employers to give preference to engineering students.

Mr. Clyde Sutherland contributed much valuable information to the meeting in his paper entitled "Examination of Local Concrete Materials." Mr. Sutherland has for some considerable time been experimenting with the various sands and gravels used in the Edmonton district, for concrete. The results and the valuable data arrived at from these experiments formed the basis of Mr. Sutherland's paper. As a result of the discussion following this paper, it was decided to appoint a committee from the Branch to further investigate our local concrete materials and have the information so gained, made available to those interested.

Lethbridge Branch

G. S. Brown, A.M.E.I.C., Secretary-Treasurer.

At the General Meeting of the Lethbridge Branch of *The Engineering Institute of Canada*, held Saturday at 6.30 p.m., forty-three members and affiliates and two visitors sat down to dinner. The chair was occupied by C. M. Arnold, M.E.I.C., newly elected Chairman of the Branch. Popular songs were sung and solos rendered which were greatly enjoyed, after which a social intermission of fifteen minutes was called. Upon resumption, business of the meeting was taken up and the resolutions re Waterton Lakes, and support of Branch to Institute of Bureau of Standards and Research, were carried.

The speaker of the evening, John Dow, plant chief of government telephones, Lethbridge, was called upon and gave a very interesting paper on "Modern Telephone Engineering." Previous to giving the address, Mr. Dow conducted the Members of the Branch through the plant. This is the last general meeting to be held for a considerable time as the majority of our members will be going into the field. The meeting was a great success and all members are looking to the time when we will be having the General Meeting again.

Winnipeg Branch

Geo. L. Guy, M.E.I.C., Secretary-Treasurer.

An interesting meeting of the Branch was held in the University of Manitoba on April 6th, at which W. N. Smith, M.E.I.C., consulting engineer of the Winnipeg Electric Railway Company, presented a paper on the self-corrosion of buried lead pipes. Professor J. W. Shipley, in co-operation with the speaker, had been conducting a series of experiments on this subject for some considerable time, and the paper disclosed the results of the experiments.

It was pointed out that a great deal of pipe corrosion had occurred in sections of the city of Winnipeg in which it would be at least expected, if stray electric railway currents were to be attributed as the cause.

Reference was made to the large number of recorded instances of the corrosion of lead pipe in moist concrete. When lead is in contact with substances containing carbonates or bicarbonates it is very susceptible to corrosion. From the experiments it was shown that lead lost from twenty to thirty times as much by weight as other metals in the above compounds. Chlorides seem to affect both iron and lead very actively, while one plate of lead was shown to be affected by continued immersion in pure distilled water.

The speaker produced samples of light colored limy silt, which apparently contained a great deal of pulverized limestone. This is found to be most corrosive to lead pipes and is the kind of soil which surrounded samples of pipes found corroded in Selkirk and in Elmwood.

Border Cities Branch

J. Clark Keith, A.M.E.I.C., Secretary.

The regular meeting of the Border Cities Branch was held in the Cadillac Café on Friday, March tenth, the business of the evening being preceeded by a dinner in which twenty-five participated.

The following members were present:—Messrs. Baltzell, Newman, Porter G. F., Thorne, Allan, Bowman, Davis, DeKam, Fletcher, Keith, McIntyre, McMordie, Porter J. E., Richardson, Riddell, Tillson, Dustan. We were glad to see several new faces around the board whom we hope will soon be corporate members of *The Institute.* The minutes of the previous meeting were read and approved.

J. J. Newman, M.E.I.C., reported on the progress which had been made with regard to impending legislation.

Major McMordie, A.M.E.I.C., addressed the meeting on the formation of the 11th Field Company of Canadian Engineers in the Border Cities, authorization having been given by the Department of Militia and Defence. A special appeal was made to the younger members whose home ties would permit them to undertake the duties of officers N.C.O's or sappers. The war strength was given as 226 of all ranks, Major, Captain, 4 subalterns, and 2 supernumeraries, the peace strength having the same officers but half the number of sappers. One evening per week for four months would be devoted to training with two weeks at summer camp. Such training was beneficial physically and morally and tended generally toward the making of good citizens.

Major McMordie's appeal was sponsored by the Chairman who stated that he would have the whole hearted support of the Branch in the undertaking. Mr. DeKam with an experience of twenty years in the Canadian army, heartily recommended to the younger members that they seek the benefits which such training would certainly bring to them.

Work of the Field Artillery.

L. B. Tillson, A.M.E.I.C., gave a most interesting address on "The Work of the Field Artillery" with particular reference to personal experiences with 18 pounders. As a preface to his remarks, he outlined the division of the British Front into zones, each with its own field artillery for infantry protection. The selection of the battery position was of prime importance and after taking into consideration the various functions which it should perform, the spot chosen was plotted on ordinance maps within a yard or two with the aid of a prismatic compass and director. This ascertained, it was necessary to lay out the lines of fire. An outstanding object such as a stack or steeple centrally placed with regard to each particular zone known as the zero point, and within the enemies line was chosen and its location plotted on the map. At a short distance from the gun pit and in line with the zero point an aiming post was erected and the gun placed in position under darkness.

By the use of diagrams, the method of aiming the piece was clearly shown, together with the corrections which were necessary to overcome various errors which might be introduced. The duties of the gunner were three fold, first, to hit, second, to hit again, and third to press home the first two hits. This was not always easy of accomplishment as very frequently it was being done at night; without the knowledge that you had made a hit it was some comfort not to know that you had actually missed.

A heavy bombardment always preceeded an attack, each battery acting independently unless feint barranges are introduced at intervals similar to that forerunning an attack. The rolling barrages are developed by the Field Artillery. The fire advances by stages of 50 to 200 yards in advance of the infantry who proceed at a rate of about 35 yards per minute. The first barrage is usually on the enemy front line trench which forms the first objective of the attacking infantry. When captured the barrage moves on until the final objective has been taken. The ammunition used in the rolling barrage is 75% shrapnel and 25% H.E. The latter is more convenient and effective but too dangerous to friendly troops.

The bombardment of Paris by long range guns was described in detail. This commenced on March 23rd, 1918, and was continued at 15 minute intervals throughout the day. To fire a projectile from the German lines a muzzle velocity of 4,500 ft. per second was necessary and no such velocity had been known at that time, although it had been approached 25 years before. Subsequent examination of the gun showed it to be 121′ long, 8′ 2″ bore and weighing 318,000 pounds. The life of the gun was 50 rounds, but it could be re-bored twice before being discarded. The projectile was 40″ long and weighed 264 pounds. The muzzle end of the gun had a smooth bore section 6 meters in length. The shell was fired at an angle of 55% reaching an altitude of 24 or 25 miles. The path of this projectile was shown by graphs deduced by the speaker as representing the actual and theoretical trajectory. As an implement of war the gun was a failure both from the viewpoint of material damage or reduction in morale. It is of interest to note that the English gun constructed by Vickers Ltd. gave a range of 100 miles.

A vote of thanks was moved by J. E. McIntyre, A.M.E.I.C., coupled with the request that the speaker relate his more fearsome experience. This was modestly done and a near tragedy culminating in a comedy was productive of considerable merriment among his audience.

London Branch

F. J. Bridges, A.M.E.I.C., Secretary-Treasurer.
R. I. Olmsted, A.M.E.I.C., Branch News Editor.

The regular monthly meeting of the Branch was held on Wednesday evening March 22nd, in the Chamber of Commerce Committee Rooms, Tecumseh Hotel. About thirty members as well as several guests were present. H. A. Brazier, A.M.E.I.C., city engineer presided and after outlining the business to be transacted announced that Thos. Adams F.S.I., would address the members at the conclusion of the business session.

The minutes of the February meeting were then read and adopted. It was with regret that the resignation of G. C. Wright, A.M.E.I.C., Secretary-Treasurer was accepted. F. J. Bridges, A.M.E.I.C., was nominated to the office of Secretary-Treasurer and was unanimously elected.

An Amendment to the By-laws was then discussed wherein it was considered necessary to increase the executive by two members. After discussion and on motion the amendment was carried. The election of the two new executive members then ensued, the successful candidates being E. V. Buchanan, M.E.I.C., manager Public Utilities Commission, and R. I. Olmsted, A.M.E.I.C.

The advisability of electing Membership and Advertising Committees was then discussed and favourably received, E. V. Buchanan, M.E.I.C., being elected Chairman of the former and R. I. Olmsted, A.M.E.I.C., Chairman of the latter.

A discussion of the Professional Act, now before the Provincial Legislature, and progress outlined by H. B. R. Craig, M.E.I.C., was reported.

The Chairman, on behalf of the Ottawa Branch, presented to the London Branch two framed photographs of which these now form the nucleus of a collection, and for which a note of acknowledgement and thanks was passed.

The Chairman then introduced Thos. Adams, F.S.I., who chose for discussion the economical and imperative necessity of town planning and how intimately connected was regional planning with the whole scheme. As an instance of the importance of regional planning Mr. Adams gave a brief resumé of a recent consulting tour which he had completed during the previous Fall and early Winter, in England and Wales. Commencing January 1923, a law has been passed in England whereby it will be compulsory to have a town planning scheme prepared. Special reference was made to the Welsh coal areas and the districts of Manchester and Liverpool.

The speaker then referred to the progress that had been made on the American continent and more especially in the centres of New York and Boston. Mr. Adams then outlined in more detail the result of the study of the conditions affecting New York; and the steps which had been taken to improve the transportation, sanitation, and water supply for these very thickly populated and congested areas; and the problem which had confronted New York in obtaining a pure water supply and the necessity of obtaining large areas for reservoir purposes. To prevent contamination and for protection these areas had been made into beautiful parks, through which were constructed splendid parkways for automobile traffic and in some cases these extended into the country for a distance of thirty miles. The larger centres like New York, the speaker stated, were divided into districts for the purpose of carrying out a comprehensive town planning scheme, each district co-operating with those adjoining and the whole centre, with this district co-operation, was arriving at a very definite plan for the good of the whole community.

Referring to the progress which had been made in London in the preparation of accurate and detailed plans in which the Geodetic Survey, Air Board and the City Engineers' department had all co-operated with the result that the information which was then available and with the plans now under preparation, when complete, would contain more accurate and detailed information than would be available in any other city of its size in Canada and probably in the whole of the North American continent.

Mr. Adams then outlined the essentials which had to be considered in laying out a new area: proper control of the building in the areas already established; proper street widths, with and without street car traffic; location of sewers, etc. A point which he emphasized as having a very important bearing on the success of any town planning scheme was the co-operation which the municipal engineers could be expected to give, by taking a very personal interest in any plan which might be recommended.

Mr. Soper, A.M.E.I.C., moved a vote of thanks to Mr. Adams for his very interesting impromptu address.

Hamilton Branch

W. F. McLaren, M.E.I.C., Secretary-Treasurer.

A joint meeting of the Branch was held 24th March, 1922, with the Toronto Section, American Institute of Electrical Engineers, in the Westinghouse Auditorium at 8 p.m. The meeting was addressed by J. F. Peters of the Westinghouse Electric and Manufacturing Company, Pittsburgh, on "220,000 Volts Transmission and Equipment". This paper will be published in full in a later issue of *The Journal.*

Its reading was followed by a good deal of discussion which was shared in by Prof. Price of the University of Toronto, H. U. Hart of the Canadian Westinghouse Company, C. W. Baker of the Packard Electric Company of St. Catharines, and others.

Following the meeting, refreshments were served by the Canadian Westinghouse Company. A hearty vote of thanks was passed to the speaker for his excellent address and to the Canadian Westinghouse Company for their generous entertainment.

Mr. Dobson, Chairman of the Toronto Section, A.I.E.E., acted as Chairman for the meeting.

There was an attendance of about two hundred, including many engineers from Toronto and St. Catharines.

A special meeting of the E.I.C. members was held afterwards, at which the following Nominating Committee was elected:—F. W. Hubbard, Chairman; H. B. Dwight; H. B. Stuart; O. W. Titus; and the Secretary.

Peterborough Branch

D. L. MacLaren, A.M.E.I.C., Secretary.

Wireless Telephone Apparatus.

The Peterboro Branch have been very much interested in wireless telephony, due to the two recent lectures and demonstrations given in the city under the auspices of the Branch on March 23rd, and April 6th.

A. S. Runciman, A.M.E.I.C., Telephone engineer for the Shawinigan Water and Power Company gave an illustrated address on high frequency telephone apparatus, and also gave a demonstration in "Receiving". The speaker spent two days in the city superintending the erection of the necessary equipment for receiving with the result that the demonstration was so successful that it was decided to have a public demonstration on April 6th. Arrangements were accordingly made with the Canadian Independent Telephone Company of Toronto, who kindly consented to co-operate with the local Branch of *The Institute* in making this demonstration a success.

It was planned originally to listen-in on the concert given by the Toronto Star, but this was found to be out of the question, and, instead, some excellent music was heard which originated in Pittsburgh, Pa., Schenectady, N.Y., and Newark, N.J. Instrumental and vocal selections from all three cities and an announcement from the Brotherhood of St. Andrew of Trinity Church, Pittsburgh, were all heard with surprising distinctness.

Immediately preceding the lecture, and during the intervals between the selections a very lucid and interesting talk on the wireless telephone was given by Dr. Charles A. Culver, Ph. D., formerly Professor of Physics at Beloit University, and now radio engineer of the Independent Telephone Company.

Dr. Culver barred all technical terms from his talk and told of the wonders of radio communication in plain everyday language which could be followed and understood by all who heard him. He traced the developments of radio from its earliest inception, and prophesied great things for it in the future. He said that within a very short space of time, probably only a matter of weeks, broadcasting stations would be operating in Canada which would send out not only concerts and sermons but market reports and the general news of the day. By this means those who possess a receiving set would know the more important items of news before the newspapers were published.

In reviewing the history of wireless the speaker explained that while Signor Marconi had, by his discoveries, marked the greatest advancement in the science, yet he was not the discoverer of the electric waves which he utilized to carry his messages. This honour belongs to an English mathematician who was able to show mathematically that such waves existed. Their actual presence was shown some years later by a German school teacher.

The speaker referred to the fact that it had been noticed that concerts sent out from Toronto within the past few days could be heard distinctly, and for great distances to the east and south, while the same concerts could not be heard nearly as well to the north and west.

It was estimated that about 1,000 persons were present and following his address Dr. Culver answered a number of questions from radio fans in the audience.

Development of Electrical Works in Peterboro.

The Branch was given a most interesting evening when H. O. Fisk, M.E.I.C., manager of the Peterboro Utilities, gave an illustrated address on the "Development of Electrical Work in Peterboro" Mr. Fisk had a great many interesting anecdotes dealing with the first electrical installation in Peterboro.

The Annual Meeting of the Branch will be held on May 11th at 8 p.m.

Kingston Branch

L. T. Rutledge, M.E.I.C., Secretary-Treasurer.

The following report covers the operations of the Branch from February 10th to April 15th, due to the fact that the activities during February were not reported last month.

Fraser S. Keith's Visit

The members of the Branch had the pleasure of meeting our General Secretray, Fraser S. Keith, during the second week of February. Mr. Keith was a guest of Queen's University at the annual Science Dinner held in Grant Hall on February 9th. Mr. Keith made an eloquent speech taking as his subject "The Engineering Profession." He spoke briefly regarding the place the Engineer held in the industrial life of the country. The activities of *The Institute* during the past few years were outlined and he succeeded in making clear to the students present at the dinner, the advantages to be derived in being members of *The Institute.*

Mr. Keith stayed over for a day to renew old acquaintances and meet the new members of the Branch. A visit such as this is very stimulating to a Branch and makes a Branch feel that Headquarters is indeed interested in its welfare.

Development of the St. Lawrence for Deep Navigation and Power

On Tuesday evening, February 28th, J. M. Campbell, M.E.I.C., president of the Kingston Milling Company, gave an address on "The Development of the St. Lawrence

River for Deep Water Navigation and Power." Mr. Campbell is very much interested in this subject and is well qualified to speak on it. He owns and operates boats on the lake and thus his interest is in navigation.

In the address, the report of the engineers recently employed by the two governments was discussed. For the analysis, the river was divided into five sections as follows,—

1. Montreal harbour to deep water in lake St. Louis.

2. Deep water in St. Louis to the outer end of the proposed ship canal between lake St. Joseph and lake St. Francis.

3. From the end of the proposed ship canal as above to the lower end of St. Regis island.

4. The lower end of St. Regis island to Chimney Point.

5. Chimney Point to lake Ontario.

The speaker gave the dimensions of the proposed locks, canals and channels. In general, a depth of 30 feet is recommended. All locks are to be 800 feet by 80 feet. The question of the generation and sale of electric power was well covered. It appears that the Americans could immediately use over one million horse power, whereas the Canadian market would be slow in development but could ultimately be realized. The conservative costs as given in the Engineers' Report impressed the members very much. The estimated cost of a 30 foot channel and 1,464,000 horse power was given as $270,714,000 or the cost of a 30 foot channel and 4,100,000 horse power of electrical energy $506,199,180.

The speaker concluded by saying that the improvement of the whole section of the river from lake Ontario to Montreal for navigation alone is feasible, but the neglect of the opportunity to develop at the same time the available power in some stretches is not warranted.

Students' Papers

The next regular meeting was held on February 14th. At this meeting three prize papers written by student members of the Branch were read.

The paper winning first prize was entitled "A Canadian High Speed Steel Plant." It was written by A. A. Paoli, a final year civil engineering student. Mr. Paoli has spent three years in the steel electric smelting industry and has gathered such a valuable fund of information on the subject that he is indeed an authority on electric smelting and the operation and design of steel plants.

His paper sought to show that it was possible to operate a tungsten steel plant in the vicinity of Vancouver so that it could compete to advantage with the British and American industries. Incidental with the main object in view, a steel plant and high speed steel was discussed. The contents of the essay as submitted were as follows,—

1. Definitions of high speed steel, its uses, unique qualities, commercial status and manufacture of the steel.

2. Location of the plant as regards raw materials, freight rates, tariff, power, labor market. Design of the plant and description of the building.

3. Equipment entering into the manufacture of high speed steel. Design of a furnace.

4. The working of a typical heat. Details of refining and alloying. Metallurgical reactions.

5. Mechanical treatment of the steel.

6. Advantages of the duplex process over the crucible process of making high speed steel.

7. Analysis of costs for a Canadian operated plant.

The paper was well illustrated by slides and the subject matter was presented practically without the help of notes.

The paper winning the second prize was entitled "Modern Conceptions of the Nature of Electricity." It was presented by Bruce Saunders S.E.I.C., a final year electrical student. The speaker first reviewed the older theories of electricity namely, "the one fluid theory", the "molecular theory" and the "displacement theory." The latest theory, the "electron theory," was then introduced and dealt with very fully.

The electron was defined as the smallest quantity of electricity possible. All electrons, no matter from what atoms they were extracted are similar. The mass of an electron is 8.8×10^{-28} grams. The mass of an electron depends on its velocity. All electrons are of the same polarity, being negative. It was demonstrated that the normal atom had enough electrons in it to neutralize the positive charge of the atom itself and then the atom acts like an uncharged body, not because it has no charge but because the two charges are neutralized. An atom is positively charged when it has lost one electron. Should a normal atom receive an extra electron, then it is negatively charged, although there are a great many electrons associated with an atom, it is not possible to remove any more than one of them.

From the view point of the electron theory, electric fields, electric conductors and electric currents were considered. Electric currents were explained to be the progressive movements of electrons. Though the individual electron bounds and rebounds with the speed of light yet the drift of electrons is very slow. In producing a current of one ampere in a copper wire one millimetre in diameter the average velocity of drift is only 0.1 millimetre per second. Thus an accurate concept of electric current was shown to be an inappreciable drift of electrons which, due to the effects of temperature, have dissimilar velocities millions of times as great as the velocity of drift. Mr. Saunders compared this drift of electrons to the movement of people past a crowded corner in New York city. Though the individual movements in an hour are very numerous, yet the net progress made in one direction is very small.

The third paper which was awarded third prize by the reading committee was entitled "A Concrete Arch Bridge." The speaker was H. R. Myers, S.E.I.C., final year civil engineering student. Mr. Myers presented his paper so clearly and masterly that the committee reconsidered their decision, finally deciding that Mr. Myers' and Mr. Saunder's paper were of equal merit and accordingly each received a second prize, the prizes being given in cash.

Mr. Myers explained the construction of the concrete arch bridge from the beginning of the work to its completion. The form work, and reinforcing etc., were well illustrated by slides.

All the papers were well discussed and many of the older engineers present commended the idea of having student papers presented.

The Annual Dinner

The last regular meeting was held on February 28th and took the form of a dinner, which has become an annual event. There were no set speeches. Everyone was expected to make a three minute speech and tell a story. Some rose very ably to the occasion. Our Chairman, Professor Wilgar, was in excellent form and contributed very much to the success of the dinner.

Ottawa Branch

F. C. C. Lynch, A.E.I.C., Secretary-Treasurer.

Valuation of Public Utilities

Probably one of the most interesting subjects, from the standpoint of the Engineering profession, is the question of the valuation of public utilities. The campaign for public ownership of public utilities, such as railways, light and power systems, street railways, etc., has required the establishment of a basis for arriving at a valuation of these properties.

The Ottawa Branch of *The Engineering Institute*, appreciating this situation, were very fortunate in being able to secure R. A. C. Henry, M.E.I.C., to give a paper on the subject of the valuation of public utilities, on the evening of Thursday March 30th. Mr. Henry was engineer-in-charge of the Grand Trunk Railway arbitration, under the Department of Railways and Canals, which gave him an excellent opportunity to study the subject.

Valuations of public utilities, Mr. Henry said, might be undertaken for various purposes, such as for general public information, for purposes of taxation, to limit capitalization, for purposes of rate-making, for expropriation or sale or purchase, for information for underwriting of securities, or for re-organization purposes.

In any given case the question of how the valuation was to be arrived at arose. Some of the principal bases used to ascertain or test values were as follows:—

(a) Capitalization of net earnings.

(b) Analysis of market quotations of stocks and bonds.

(c) Analysis of original cost to date.

(d) Estimating cost of reproduction new, and cost of reproduction new less depreciation.

A common method of valuing public utilities by bankers, financiers and commercial interests, was by the stock and bond method. Such a method of valuation would necessarily have to be supplemented by an examination of the rights, franchises, physical condition of the property and the accounting methods adopted by the utility in showing the results of operations.

Estimating the cost of reproduction new was a practice that had been resorted to, partly because of the impossibilities in a great many cases of obtaining records which disclosed the actual cost, and partly for the purpose of taking account of any increment in value subsequent to date of construction caused by reason of the development of the tributary territory, or for any other reason.

Referring to depreciation, the speaker said it was a stern cold fact that in the case of every public utility at some time in the future certain or all of its units would cease from one cause or another to function. Failure to appreciate this feature and to provide for the same, was often very disastrous. There was a considerable difference of opinion among engineers and others as to whether or not in a reproduction estimate, anything should be deducted for depreciation. "Going concern" value as distinct from development cost was a value which was placed upon a utility in addition to its bare cost, because the plant was functioning and might be figured more or less in terms of money than the development cost. Mr. Henry quoted a number of important valuations that have been made in the past in the United States and Canada, referring to several valuations which have been made of the Ottawa Electric Railway Company's system.

Major F. D. Burpee, A.E.I.C., in speaking to the subject, gave a brief analysis of the matter as it applied to street railways. In speaking particularly on valuation he said that reproduction costs constituted the basis of value in a normal economic period, and added that profits and dividends were only a small part of the operating costs of a street railway.

Among those who contributed to the discussion were: Messrs. John Murphy, M.E.I.C., electrical engineer for the Department of Railways and Canals; A. Ferguson, M.E.I.C., general assistant engineer, Department of Railways and Canals; Dr. J. G. Rutherford, chairman of the Board of Railway Commissioners; and Mr. Naulan Cauchon, A.M.E.I.C., chairman of the Town Planning Commission.

Engineering and Agriculture

The claim is made by some agriculturists or their would-be friends that "the farmer feeds the world". Without the engineer the farmer could not feed himself. Under present-day living conditions the farmer is dependent upon the engineer, as are all other classes of people.

In the above statement Dr. J. G. Rutherford summed up his address on "Engineering and its Relation to Agriculture", at the monthly luncheon of the Ottawa Branch.

Dr. Rutherford stated that after having had farming experience in eight out of the nine provinces of Canada he had come to the conclusion that the farmer is all right. He is about the sanest kind of a citizen we can have in the country; his capital is invested in land, buildings and live stock, and a man with his all at stake is not usually a dangerous demagogue.

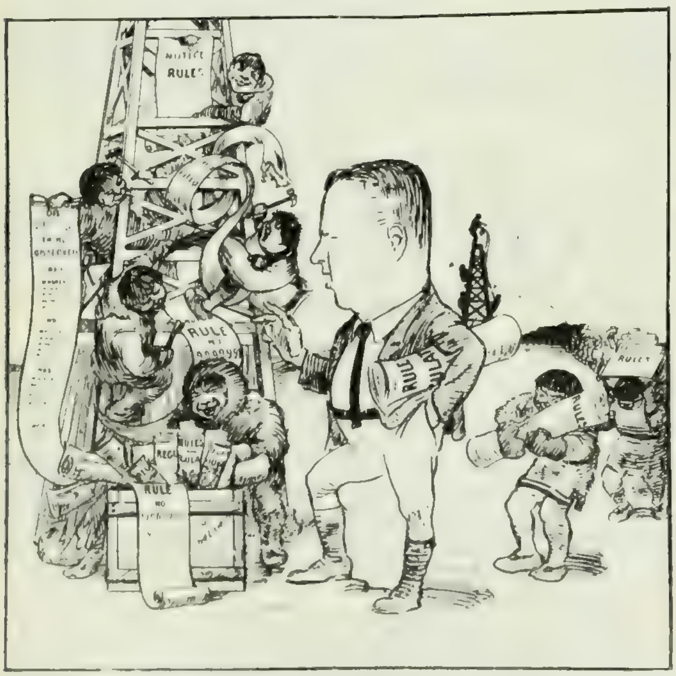
Referring to the demands which are being made for reduced freight rates for farm products, Dr. Rutherford stated there were two classes of demands from farmers, one of these was for the construction of railways at any cost to provide accommodation, regardless of what rates would have to be charged; and the second was from the farmer who had a railway, but now wanted the rates reduced.

The speaker compared the condition of the farmers of to-day with that of the pioneer of the prairies. Unfortunately, the spirit of the pioneer seems to obtain no longer. This, he considered, was the result of the American invasion of the Northwest, which latter was characterized as sheer exploitation. Land had been deliber-

ately worked out, and a yield of thirty-five and forty bushels per acre had been reduced to an average of ten. The real farmer, however, was making a home for himself and is undoubtedly successful. On some farms four grades of buildings may be observed, showing the progress of prosperity from the original log house on the homestead to the comfortable home with every convenience. Referring to the supposed hard times among the farmers of the west, Dr. Rutherford gave some striking illustrations of agricultural financing.

Dr. Rutherford concluded by saying he hoped some day the Railway Commission would be reinstated in the goodwill of the public. They had a difficult role to fill. The railways were necessary to the country and to the farmer, but they had to earn a dividend for the shareholders. The position was simply that the people using the railways had to pay for them. It was not fair to endeavour to make others do it.

K. M. Cameron, M.E.I.C., Chairman of the Branch, presided, and he was supported on both right and left by a strong representation of Members and Deputy Ministers, while seated on his left was Dr. J. H. King, the new Minister of Public Works, who, in a few remarks, said he was glad to meet the engineers in a body, and looked forward to meeting many of them individually in the course of his duties as head of the Public Works Department.



O. S. Finnie, Ruler of the Mackenzie Basin

Montreal Branch

J. L. Busfield, A.M.E.I.C., Secretary-Treasurer.

Montreal Water Works

At the regular meeting of the Branch on March 23rd C. J. DesBaillets, M.E.I.C., Chief Engineer of the Montreal Water Board read a paper describing the engineering features of the recent work carried out by the Water Board of Montreal in connection with the enlargement of the aqueduct. Mr. DesBaillets dealt particularly with the equipment of the new low level pumping station. S. J. Fortin, M.E.I.C., presided.

Electrons and Atoms

On Thursday evening, March 30th, W. B. Cartmel of the Northern Electric Company, gave an address, unique in its nature, dealing with electrons, atoms and the ether. The speaker gave an account of present day ideas as to the nature of electricity and matter, and illustrated his remarks by a number of interesting experiments for which purpose a quantity of electrical apparatus has been installed in the hall. It is hoped that Mr. Cartmel's paper will be published in a future issue of *The Journal*. William C. Adams, M.E.I.C. chief engineer of the Northern Electric Company presided at this meeting.

Submarine Coal Mining

On Thursday, April 7th, F. W. Gray, A.M.E.I.C., dealt with the above subject in a masterly way. Mr. Gray stated that coal has been mined from under the sea since 1872. Eighty percent of the available coal reserves of Cape Breton Island are under the sea, and seventy percent of those of the whole of Nova Scotia. About seventy percent of the coal produced in Nova Scotia at this time comes from under the sea. The furthest distance from shore at which coal is being mined is in the Princess Colliery of the Nova Scotia Steel and Coal Company at Sydney Mines, where the face of the main deeps is 2¼ miles from shore. At many other points coal is being worked at distances exceeding one mile from shore under a thickness of strata lying between the coal seam and the sea bottom ranging up to 1,400 feet.

The only important difference between mining coal from under the land and from under the sea is the danger of inundation from the sea, and the chief necessity imposed upon the mining engineer is to prevent breaking and distortion of the strata lying above the coal seams. This necessitates accurate knowledge of thickness of strata, and soundings to show the contour of the sea floor. The nature of the strata is important, an advantage being the existence of impervious clays and rocks possessing some elasticity. Pockets in the sea floor, the existence of old beaches and dislocation of strata are important matters of knowledge and record. Absence of landmarks, and necessity to carry survey lines from tie points on shore, required surveying of great accuracy.

Mine inundations from the sea have not been numerous, and have not, with one possible exception at Takashima Colliery in Japan, been accompanied by great loss of life. An accident occurred on the Cumberland coast of England in 1834, where 36 men were drowned by letting in the sea as a result of the foolish action of an incompetent manager. In Nova Scotia two inundations have taken place, each unaccompanied by loss of life, one at Ford Hood Colliery and one at Mabou Colliery, both in the Inverness field of Cape Breton. The flooding of Mamou Colliery was a result of poor judgment and incompetent mining. The flooding of Port Hood has never been satisfactorily explained, as where water entered there was vertical strata cover of 940 feet, and it is extremely improbable that water could have entered from the sea through a vertical crack of this extent.

The problems of mining under the sea are many and serious. The great problem in the Nova Scotia fields is the transmission of power underground for long distances from the point of entrance, and the forcing of fresh air through many miles of underground passages. The taking of workmen to and from the working face each day will become a question of much importance when workings extend four or five miles seawards, or even greater distances as is not an unlikely possibility of the future.

Mr. Gray showed a unique series of photographs to illustrate the rapidity with which the carboniferous strata of Cape Breton is being eroded by the sea. The photograph showed the wasting of what was formerly a prominent sandstone spur on the coast near Glace Bay, taken at intervals over 21 years, during which time the spur has been gradually disappearing.

John T. Farmer, M.E.I.C., presided at this meeting.

Carrier Current Telephony

On Thursday, April 13th, H. J. Vennes, transmission engineer of the Northern Electric Company, gave a very interesting description, illustrated by lantern slides and special apparatus, of the modern system of transmitting telephone messages by means of carrier currents, with special reference to the installation between Edmonton and Calgary. Great interest was displayed in this paper and there was considerable discussion.

Professor C. V. Christie presided.

Meeting of Electrical Engineers

On Wednesday evening, March 29th, a number of electrical engineers and officers of the Montreal Branch gathered together at an informal dinner at the University Club and discussed the general situation regarding the representation of electrical engineers in the Montreal Branch. The advisability of creating new sections of the Branch was discussed but it was finally decided that no change should be made in the present Branch organization, but that the scope of the electrical section should be widened so as to insure the proper representation of electro-physical, communication and radio engineers. It was decided that it might be desirable to occasionally hold meetings on other evenings than Thursdays at which very special electrical papers of a highly technical nature might be presented for discussion.

Quebec Branch

Hector Cimon, A.M.E.I.C., Secretary-Treasurer.

There was a well attended meeting of this Branch held in the "green room" at the Chateau Frontenac on Monday evening, March 27th., when very instructive and interesting lectures were delivered by Arthur Fournier, A.M.E.I.C., managing director of Pruneau and Company, Limited, of Quebec and by Olivier Lefebvre, M.E.I.C., chief engineer of the Quebec Streams Commission.

Coal Tar Industry

Mr. Fournier, who spoke in English, took as his subject "Coal Tar Industry" and his discourse of a technical nature was ably prepared and well delivered.

In the beginning of his address, he dealt with the various by-products of coal, but concentrated his remarks in the main on the production of coal tar. He covered this industry in its various stages up to the present day, describing the different kinds of tar produced, the methods employed to produce it, the blending process and the use to which these products are put. In the last part of his address, he spoke of road tars and gave a detailed description of the way in which these tars are made and how and where they are used.

Mr. Fournier was heartily applauded as he concluded and was particularly congratulated on the fluent manner in which he delivered his address in English.

The Gouin Dam

Mr. Lefebvre's address was on the "Gouin Dam", on St. Maurice river, and was illustrated with lantern slides showing plans of the dam and also with moving pictures of these famous storage works.

The speaker touched at length upon the features of the dam which he described as a "Concrete monument to the genius of man," and paid a high tribute to the acumen of the late Hon. S. N. Parent, the first president of the Commission.

He explained in detail the construction of the immense storage plant and showed how it operated. This dam, he said, would stand an ice pressure of 50,000 lbs. per foot, but strangely enough no ice had formed within a hundred feet of the gates.

The Quebec Government paid for the huge dam and was being reimbursed by the companies which benefitted by the use of the stored water. They paid interest on the capital invested as well as a sinking fund over a period of 40 years and the cost of operation. The revenue from the dam was now $210,000 but would eventually attain $400,000 when all the water powers on the river had been developed.

Mr. Lefebvre also gave account of the present developments on the St. Maurice river and outlined the possibilities of the future developments. He foresaw the production of one million horse power on that great water course.

The meeting was presided over by Chairman A. R. Décary who introduced the speakers and also thanked them most cordially for their very interesting lectures.

Joffre Terminals, Levis Division, C.N.R.

Joffre Terminals, formerly known as Chaudière Junction, as a freight terminal for the district of Quebec was the theme of a very interesting address delivered by J. E. Gibault, A.M.E.I.C., division engineer, C.N.Rys. Levis, before the members of this Branch at their monthly luncheon-meeting, which took place at the Chateau Frontenac, April 10th.

The speaker stated that this terminal was the most important out of the seven terminals in the district of Quebec and, perhaps, one of the most important in the whole of the Dominion of Canada. It supplied some six hundred and thirty miles of railroad territory with freightage which originated at this point. Thirty-five trains per day were dispatched from that centre.

Mr. Gibault fully described all the facilities which

are to be found at Joffre and with which it is now possible to handle considerable freight with 35 men. He said that $300,000 had been spent for adequate facilities and that, among those, was a series of 68 sidings with a total capacity of 1,452 cars.

Alex. Larivière, A.M.E.I.C., at the conclusion of this address moved a vote of thanks to the speaker saying that the members present, besides being very much interested as engineers were still more interested, as citizens of this country, in knowing what was being done on our C.N.Rys., and that they were very pleased to hear Mr. Gibault talk of his division and of the whole system in such an optimistic manner.

Chairman A. R. Décary, who had presided at the meeting, added a few words and suggested that a visit to Joffre Terminals be arranged to take place shortly. The suggestion met with complete approval and the visit will, no doubt, be much appreciated.

Historical Sketch

A short historical sketch of this Branch, of its formation and past activities, will, no doubt, be of interest to our members.

Looking backward through the annual reports of the Canadian Society of Civil Engineers, now *The Engineering Institute of Canada,* we find that the formation of Branches throughout Canada resulted from a resolution of the Annual meeting of 1904, which reads as follows:—"That the Council be instructed to consider with as little delay as possible the establishment of Branches of this Society in the large centres in Canada, and be authorized to provide the financial aid necessary to establish and maintain such Branches."

In 1904, some work was done towards the formation of a Branch in Toronto.

In 1905, a Branch was formed at Sydney, the establishment of a branch in Ottawa was being taken into consideration and no final action was reached with regard to the Toronto Branch.

In 1906, the Sydney Branch is in operation, the Toronto Branch is formed, members in Manitoba contemplate the formation of a Branch at Winnipeg and an application from Quebec is filed at Headquarters. In 1907, Branches are formed at Quebec and Winnipeg and, in 1908, we find in full operation:—Toronto, Quebec and Winnipeg. The Sydney Branch, unfortunately, no longer exists. In 1914, there were 9 Branches from coast to coast, while, today, *The Institute*'s family numbers 22 strong and healthy Branches.

The Quebec Branch is one of the three oldest Branches. The petition for the establishment of a Branch in Quebec was signed by 31 engineers of Quebec and vicinity, 16 of whom are still active members of this Branch. The first regular meeting was held on January 17th, 1907 and the first Executive Committee included the following gentlemen:—

President, E. A. Hoare; Secretary-treasurer, P. E. Parent; Assistant-secretary, Hugh O'Donnell; Councillors: A. R. Decary, J. M. McCarthy, St. Geo. Boswell.

During the first years of its existence, the Quebec Branch found it fairly difficult to get financial aid from Headquarters and the local members gallantly pledged themselves for a voluntary subscription to the Branch fund.

The total membership of the Branch, at the end of 1907, was 42; to-day, it is nearly 100 and the Branch has also a number of friends who might become Associates.

The past presidents were:—
1907-1908: — E. A. Hoare,
1909: — L. A. Vallée,
1910: — A. E. Doucet,
1911: — P. E. Parent,
1912: — W. D. Baillargé,
1913: — A. R. Décary,
1914: — Arthur Amos,
1915: — S. S. Oliver,
1916-1917-1918: — A. E. Doucet,
1919-1920-1921: — A. R. Décary.

Reviewing the activities of this Branch, a few words must be said about our regulations or by-laws.

Among the many by-laws or rules which this Branch adopted or suggested to Headquarters during its stage of organization, the following are worth noting since some of them have been discussed lately by other Branches.

Quorum at all meetings to be 5; (1908)

Two meetings to be held each month; (1908)

Annual meeting to take place in third week of January this was changed to first week of May, last year;

This Branch to have jurisdiction and include all members of the Society from Three-Rivers to the East Boundary of the Province of Quebec; (1909)

Headquarters to seek recommendation from Executive of Branch before admitting a new member; (1909)

Of the services performed or the important resolutions passed by this Branch in connection with professional matters, etc., are to be mentioned:—

1908, the Q.L.S. Bill;

1909, Tariff of fees for professional services; Forest protection against fires: this resolution was brought to the attention of the Prime Minister.

1912, Enactment of laws in all provinces similar to those then existing in Quebec and Manitoba; this resolution was brought to the attention of Council; Formation of a Committee on Steel Bridges Specifications;

1918, Formation of a permanent Committee on Legislation; the Quebec & Atlantic Ry. Bill; Amendments to the Quebec Act; (penalty clause) List of recognized schools of Engineering submitted to Council;

1919, Considerable attention is given the Provincial Division or Corporation of Professional Engineers of P.Q.; the Stationary Engineers Bill; Formation of an Employment Committee for returned soldiers;

1920, Formation of a Special Committee on Classification and Remuneration of Engineers;

1921, the Forestry Engineers Bill;

May it also be pointed out that, during the Great War, namely in 1914 and in 1917, this Branch subscribed over $300.00 to the Patriotic Fund and the Red Cross.

Now, as to the lectures on engineering topics given before this Branch, we have had:—

1909:—"Aids to navigation between Quebec and

Belle Ile" by P. E. Parent, Esq., A.M.E.I.C.

"Forestry Preservation" by R. O. Sweesey, Esq., followed by comments by Prof. Gagné of the Toronto University.

1912:—Water-Powers by R. O. Sweesey, Esq.

1913:—"Les bons chemins" par Mr Gabriel Henry, A.M.E.I.C.

"A paper on the Quebec Bridge" by E. A. Hoare, Esq., M.E.I.C.

1014:—"La mise en œuvre des chûtes d'eau et les prix de revient comparatifs dans divers pays" par Arthur Surveyer, Ecr., M.E.I.C.,

"Cast Iron vs Steel mains for water supply" by T. A. J. Forrester, Esq., A.M.E.I.C.

1916:—"Munitions" by M. Wolff, Esq.

1917:—"Chaudière River Flood, July 31st. 1917" by E. A. Evans, Esq., M.E.I.C.

1921:—"Recent developments in Concrete" by Col. Boyden of the Portland Cement Association of Chicago.

The above only mentions some of the most salient features of the work performed by this Branch in the past. It says nothing of what the present Executive Committee is trying to do to serve our members in the best way possible to make our meetings interesting and to enhance the usefulness of the profession to the public.

Let us state, before concluding that this Branch held 118 general meetings and 47 executive meetings or a total of 165 from 1907 to the end of 1921, which may give a fairly good idea of the work performed.

Now, let us add a few words about our Chairman, A. R. Décary. He was one of our Founder Members, he was appointed a Councillor of this Branch in 1907 and. ever since, he has been on the Executive Committee, No one has been more closely connected with this Branch and to state that our minute-books give him credit for having attended 131 out of 165 meetings, that is 80% in 15 years, since the formation of this Branch, is enough, as one may believe, to make everyone realize the immense services he rendered this Branch and *The Institute*. We are grateful to him for his clever management of our Branch affairs and we appreciate all he has done towards promoting our professional interests".

Read by the local secretary at the Regular Meeting of the Quebec Branch, held at the Chateau Frontenac, 27th, 1922.

St. John Branch

Harry F. Bennett, A.M.E.I.C., Secretary-Treasurer.

Further results of the tests of concrete in sea water being carried out in St. John harbour by the Dominion Department of Public Works in conjunction with the St. John Branch of *The Engineering Institute of Canada* were described in a paper on the subject read before the St. John Branch on April 20th, by A. G. Tapley, A.M.E.I.C.

These tests were started in 1920 and additional test blocks were placed during 1921. The results shown are not yet conclusive, and, while a few of the blocks are standing up, it cannot be definitely stated that a mixture has been obtained which can be used with safety.

Observations of the older specimens show that during the summer season the disintegration was not apparent, but with the advent of winter it is rapid and very apparent. The blocks which were of a wet consistency are found to disintegrate most rapidly, and when the outer protecting skin is broken the body of the block offers little resistance. Of the specimens which show no disintegration after two years, the proportions of the mixture were 1—1½—3 and 1—2—4. The better blocks were allowed to set in air from seven to eight days after casting. A longer set in air does not seem to add to the resistance of the concrete.

During 1921 further test blocks were made under conditions similar to concrete construction in St. John harbour. One block was also made by the Canada Lock Joint Pipe Company, Ltd., of a mixture similar to that used in the lock joint pipe for the West St. John water main, this block set in air three months. In the 1921 tests, various ingredients were added to the different blocks, such as kerosene oil, pine tar, crude oil, powdered alum, gypsum, barium chloride, acetate of copper, raw sugar, infusorial earth, ochre, sodium silicate and toxement. Some of these have shown signs of deterioration even in one winter and another season will prove the advisability of using any of these ingredients.

The paper was splendidly illustrated by lantern slides and charts. At the conclusion of the paper, Major C. F. Draper, M.E.I.C., in discussing the subject, stated that he was disappointed that no definite results had been obtained, but the tests had shown the necessity for the greatest care in the manufacture and placing of any concrete in sea water. The nature of the tests had been varied and he congratulated Mr. Tapley on his work.

Alex. Gray, M.E.I.C., said he felt that the results had impressed him with the fact that the chemical composition of the ingredients was a large, and probably the governing, factor in the development of a sea water resisting concrete. The good blocks obtained were little different from some which had disintegrated and we must find the cause.

A vote of thanks was extended to Mr. Tapley by F. P. Vaughan, M.E.I.C., Chairman of the Branch.

A party from the St. John Branch visited the Traffic Department of the Western Union Telegraph Company at St. John on Saturday, March 18th. The various features of the equipment and methods of operation were explained by J. M. Wilson, superintendent of the department. The members were very glad to have the opportunity of visiting the plant.

The last of the "Seeing St. John" visits of the Branch was made on April 22nd to the plant of the N. B. Telephone Co., Ltd. Through the courtesy of F. J. Nesbit, exchange manager, and W. R. Pearce, M.E.I.C., chief engineer, the party was led through the intricacies of the telephone operation and were much impressed with the development of the system. The Branch is indebted to the company for this opportunity.

Cape Breton Branch

Kenneth G. Cameron, A.M.E.I.C., Secretary-Treasurer.

The Operation and Equipment of the Iron Ore Mines at Bell Island, Newfoundland

A regular monthly meeting of the Branch was held March 9th, when S. C. Mifflen, B.Sc., A.M.E.I.C., read

an excellent paper on the above subject. The paper was illustrated by a variety of photographs and also, through the courtesy of the Maritime Motion Picture Company, by a reel of films which showed actual operations, and put the finishing touches to the description.

Dinner and Social

On March 23rd, a most successful dinner and smoker was held at the Norfolk Hotel, Sydney. The Chairman of the Branch, C. M. Odell, M.E.I.C., presided, Geo. D. Macdougall, M.E.I.C., and E. C. Hanrahan, president and secretary respectively of the Nova Scotia Mining Society, were guests.

The evening's arrangements were made by A. W. McMaster, A.M.E.I.C., and W. S. Wilson, A.M.E.I.C., and the unqualified success was a tribute to their organization. The intervals during the meal and subsequent intervals were filled in by choruses from the Rotary Club song books, in a manner which belied the engineers' reputation for silence and incapability of expression.

After the dinner those members who were accompanied by friends were asked to introduce them to the company. The Chairman then conveyed regrets and good wishes from North Sydney members who were unable to be present.

Mr. Odell, continuing, gave an account of the origin of the Canadian Society of Civil Engineers, tracing engineering work back as far as the early exploration work of Alec. Mackenzie and Simon Fraser, whose tracks were followed a hundred years later by the preliminary surveys of the Western lines. He pointed out that the splendid work done by these pioneers had not at the time received its due recognition, even their burial place being forgotten.

Such incidents as these had caused that agitation for recognition which resulted in the founding of the Canadian Society of Civil Engineers in 1887. The subsequent developments of the Society, its recent change of name, and the greatly increased activity of late years have resulted in its now occupying a prominent national position. Mr. Odell again emphasized the immense advantages which membership brought to the younger members, and urged one and all to take the keenest interest, attend all meetings, prepare papers, contribute to the discussions, and take part in the social gatherings.

Mr. E. C. Hanrahan complimented the Branch on its progress to date since its organization, and on the enthusiasm and success of the evening. As a Cape Breton resident of long standing, he told of the early engineering works in the Sydney district, the scepticism with which early efforts were greeted, and the coming of the I.C.R.

Mr. Macdougall, M.E.I.C., chief engineer of the British Empire Steel Corporation, endorsed the Chairman's remarks in regard to the value of *The Institute* as a body, adding that he had been a member for twenty-one years.

In defining the term "Engineer", as one who controls and uses the arts and materials of nature for the benefit of mankind, he spoke of the early work, largely military, and the enormous developments and wonderful ramifications which it has lead to at the present day. Paying tribute to the great men who have been associated with the Society and *The Institute*, he made special mention of one who, for twenty-five years, was Secretary and who was a native of Cape Breton and his maternal uncle, Professor C. H. MacLeod.

The works of these prominent engineers were to be found all over Canada and formed a record of which the profession might well be proud. The real pleasure and satisfaction of the young engineer was derived from the fact of diligent work and the giving of the best that was in him. Work carried out in that spirit could not fail to bring success.

The Chairman, speaking further of the work of the profession, quoted from the tomb of Sir Christopher Wren in St. Paul's Cathedral London,— "If you would see his monument, — look around".

The feature of an excellent programme which followed was a sketch by Dan Ross on "Scientific Impressions of Modern Transportation". Mr. Ross, in the character of a backwoods rube of the early Cape Breton days, kept his audience convulsed for over half an hour describing his trip to Boston and his adventures there.

The Mechanical Working of Iron and Steel

At a regular monthly meeting held May 4th., an illustrated paper on the above subject was read by I. W. Buckley, A.M.E.I.C., assistant superintendent of mills for the Dominion Iron and Steel Company.

The author showed how iron and steel are worked in the three different processes of hammering, pressing and rolling, giving a brief description of each process. Incidentally he mentioned that the rolling mill was invented by Henry Cort, who was born at Lancaster, England, as long ago as 1783. The same man invented the puddling process of making iron.

The heating and furnace treatment of the steel was gone into thoroughly, and the way in which steel has supplanted iron in its many uses, was well shown by special curves, which were very interesting. Taking iron and steel rails rolled at different periods, previous to 187[illegible] more iron than steel rails were rolled, and after 189[illegible] very few iron rails were produced, whereas the production of steel rails increased yearly, until in 1907 there were 3,632,729 gross tons of steel rails rolled. Of interest also was a chart showing the relation of open hearth and Bessemer rails. Bessemer tonnage has declined rapidly since 1907, while in 1913, there were over two and a half million tons of open hearth material produced.

Mr. Buckley gave a detailed description of various types of rolling mills, drawing attention to special points in their design, and operation. This part of his paper was covered by a large number of specially prepared charts and drawings.

He concluded by quoting from Henry David Hubbard's writings, with reference to steel.

I am Steel.
I am forged into factories, spun into railroads, and woven into cities.
I make man strong of arm, swift of foot, and a miracle worker.
I scoop out harbours, span rivers and oceans, move mountains, and toss them into the sea.
My arms, tireless, strong, skilled beyond dreaming, set men free.

My power to serve is boundless, for in me pulsates cosmic energy.
In soldier's hands, I carve the way to freedom.
With the surgeons, I cut the way to health.
With the worker I build civilization.
I take man's puny crafts, one by one, and make them all vast enterprises.
I am Steel.
Man is my master.
I am his Master's servant.
I await his commands to create new eras.

Transfer of Members to Other Discricts

During the past few months, the following changes of membership have occurred.—

C. L. Cantley, A.M.E.I.C., has returned to New Glasgow from Sydney.

J. F. F. MacKenzie, Jr.E.I.C. is now with the Dominion Bridge Co., Lachine, Que.

J. L. Underhill, Jr.E.I.C., has left the Nova Scotia Steel and Coal Co., and is now resident in the States.

Nova Scotia Act Governing Steam Boilers.

Welcome evidence of the awakening recognition of the Professional Engineer by the Public is given by the action of the Minister of Public Works and Mines for Nova Scotia, who has sought the cooperation of the Association of Professional Engineers of Nova Scotia in the matter of putting into force an Act governing the design, construction, and inspection of steam boilers. The Association, at a Council meeting held April 6th., recommended that this matter be deferred to the Nova Scotia Branches of *The Institute.*

The Executive Committee of the Cape Breton Branch, at a special meeting held April 12th., to consider this matter, concurred in the resolution forwarded by the Council of the Association, and recommended to the Minister of Public Works that D. W. Robb, M.E.I.C., of Amherts, W. G. Matheson, M.E.I.C. of New Glasgow, and J. H. Fraser, A.M.E.I.C., of Sydney, would form a suitable committee to deal with this matter.

Halifax Branch

O. S. Cox, A.M.E.I.C., Secretary-Treasurer.

The regular monthly meeting of the Halifax Branch was held in the Green Lantern at 6.15 P.M. March 29th, Chairman C. E. W. Dodwell, presiding. Number present 35. After an informal supper the business of the meeting was proceeded with. Nominations were asked for members of the Nominating Committee for the ensuing year and the following were nominated:—D. W. Robb, M.E.I.C.; C. A. Fowler, A.M.E.I.C.; F. W. W. Doane, M.E.I.C.; J. W. Roland, M.E.I.C.; F. R. Faulkner, M.E.I.C.; K. H. Smith, M.E.I.C.

W. G. Hardy, M.E.I.C., then presented a paper on Engineering Underground in France. R. R. Murray, A.M.E.I.C., was to have given a paper on this subject but as he was unable to be present, Mr. Hardy read Mr. Murray's paper and supplemented it with accounts of operations from his own experiences in similar lines of military engineering. The paper dealt with various methods and types of construction employed in shaft sinking, tunnelling and dugouts with detailed accounts of actual operations in which Messrs. Hardy and Murray took part, including the placing and blowing of some of the largest mines used on the Western front during the war. The speaker traced the great development of this phase of warfare during the late war, showing in contrast the extent of the mining operations in the early part of the war and that developed before its close. This very interesting and instructive paper showed what is little realized by most people, the very important part played by the Engineer in the great war. Extensive accounts have been written and many books published, dealing with the engagements taken part in and the victories won by the infantry, artillery and other units, while scarcely more than passing notice has, in many cases, been given to the Engineers who prepared the way and made these victories possible. Mr. Hardy's paper was supplemented by lantern slides, maps and plans of actual operations carried on at the front. At the close of the paper, Mr. Hardy was extended the hearty thanks of the Branch.

Town Planning Notes and Comments

Horace L. Seymour, A.M.E.I.C.

NOTE. — *In order to make this column of wide interest to members of The Institute, personals and items of town planning interest will be appreciated. Address: Horace L. Seymour, A.M.E.I.C., 40 Jarvis Street, Toronto.*

Town Planning and Current Periodicals

There are certain magazines that are devoted entirely, or at least primarily, to the interest of town planning in its various phases. A list of such magazines would include the "Town Planning Review", and "Garden Cities and Town Planning" published in England;" Landscape Architecture," "The American City" published in the United States and the "Journal of the Town Planning Institute of Canada" published in this country.

Apart from these magazines, it is significant to note the attention that is being paid in current engineering and other periodicals to the subject of town and city planning.

The Saturday Evening Post—Those interested in problems of town planning are strongly recommended to read the article "Your Town Tomorrow" by James H. Collins, that appears in the April 1st., issue of the Saturday Evening Post. Mr. Collins deals particularly with the matter of traffic and forces home the fact that it is the automobile that is going to alter our cities. "Speed limits on the automobile are a paradox" he quotes. "The automobile is designed to run fast. That is its whole function, attraction and service. Limit it, and you lose all its benefits. Speed limits and traffic control have become necessary because we have not yet learned to separate the automobile from slower traffic, and give it highways of its own."

Mr. Collins sees that there must be a sorting out of the different kinds of traffic and that new channels must be provided for the different kinds. "Street cars, automobiles, motor-trucks, horse vehicles and pedestrians must be separated and given their own right-of-way where none can hamper or endanger the others." He forecasts the disappearance of the surface car and the provision of overhead and underground means of travel for the automobile.

Another suggestion is for automobile highways between large cities, so located that, they bypass the important streets of intermediate towns and villages.

Engineering News-Record.—In the February 16th issue of this magazine there is a review of the biography, "Daniel H. Burnham, architect, Planner of Cities," under the caption "A Great Architect and City Planner."

Mr. Burnham's famous injunction, formulated in 1907 and well-known to town and city planners, should be known by every city engineer:

"Make no little plans; they have no magic to stir men's blood and probably themselves will never be realized. Make big plans; aim high in hope and work, remembering that a noble, logical diagram once recorded will never die, but long after we are gone will be a living thing, asserting itself with ever-growing insistency. Remember that our sons and grandsons are going to do things, that would stagger us. Let your watchword be order and your beacon beauty."

Engineers and Engineering.—The February issue of Engineers and Engineering, a monthly magazine published by the Engineers' Club at Philadelphia, is devoted almost entirely to zoning. It includes an article on the "Proposed Zoning Ordinance for Philadelphia" by local city officials; an address on "Zoning" by the Hon. Edward M. Bassett, the counsel for the Zoning Committee, New York City; "The Relation of City Planning and Zoning to the Selection of Type of Pavement" by Jefferson C. Grinnalds, secretary of the Zoning Commission, Baltimore, and also assistant engineer to City Plan Committee.

Every engineer interested in zoning and city planning should add this February number to his library.

The Ottawa Journal.—In connection with the Ontario "Deferred Widening Bill" the Ottawa Journal on April 4th., under the caption "A Desirable Measure" stated editorially in part as follows:

"A bill is now before the Ontario Legislature aiming at the removal of a disability from which nearly all Canadian cities have suffered—the difficulty of taking preparatory measures for the widening or extension of streets in advance of the time when such work may be properly commenced, to the end that new buildings in a street to be widened or extended may not be so erected as to obstruct or make more costly the work of improvement when it is undertaken."

"The Bill now before the Legislature aims to supply it. It provides that a municipal bylaw for establishing, or extending, or widening a highway or part of a highway may specify that the corporation shall not enter immediately upon the land required to be taken for such purpose or purposes to proceed to carry out the work, but that entry on the land and the commencement of the work shall be delayed until a day named in the bylaw, which shall be not less than three years, nor more than fifteen years after the passing of the bylaw."

"In the matter of compensation the value of the land to be taken is to be fixed as of the date of the bylaw (or of filing of advanced plan) and while the Corporation (or the owner) might proceed at once after the passing of the bylaw to have the compensation fixed, it would not be payable until the date of entry."

National Municipal Review.—This magazine should probably have been included in the list of those published in United States that deal, in part at least, with town planning, as [amongst other organizations serves the National City Planning Conference.

The March issue includes an article "Zoning Chicago" by E. H. Bennett, Director of Zoning Work for the city of Chicago. Mr. Bennett gives some idea of the field surveys necessary for the preparation of zoning study maps, which should be of value to engineers interested in zoning. Mr. Bennett estimates that approximately one billion dollars has been spent in building development in the last ten years in Chicago, on industry, business and housing construction. The total expenditure in the thirty years just past, is estimated at five billion dollars.

"The sum total of saving that can be achieved by reason of regulated growth and resultant preservation of values and creation of new values, etc., in this period—or in one generation—it is safe to estimate at not less than one-fifth of this sum, or $1,000,000,000!"

CORRESPONDENCE

Editor, *Journal*:— April 8th, 1922.

Dear Sir,

In *The Journal* for April, 1922, page 205, I have noticed an announcement of the price at which the publications of this Society may be purchased. I am sorry to say that the prices quoted are in error and should be as follows:—

	Rate to Members	Rate to Non-Members
"Proceedings", single copies...	$ .50	1.00
Per year....................	No charge	8.00*
"Transactions", per year.....	No charge	12.00†

*If subscription is received before January 1st, otherwise $10.00

†If received before February 1st, otherwise price is $16.00.

These publications may be purchased by members of *The Engineering Institute of Canada* at a discount of 50% from the non-member rate.

Yours very truly,

(Signed) ELBERT M. CHANDLER

Acting Secretary.

American Society of Civil Engineers,
29 West 39th Street, New York, N.Y.

Triangulation Data

Editor, *Journal*:— Ottawa, March 18th, 1922

Dear Sir:

It has occurred to me that most engineers have not in convenient form for calculation, formulae for use in connecting up surveys with triangulation. With this in mind, I have compiled a series of examples of the following problems:—

1. *Determination of Latitude and Longitude*, when the length and azimuth are given.

2. *Determination of Length and Azimuth* of fixed lines, when the latitude and longitude of each end of the line is given.

3. *Determination of Plane Rectangular Co-ordinates* from geographic co-ordinates.

4. *Determination of Latitude and Departures*, adjustments, in inverse solution.

These examples are based upon the latest and best geodetic formulae recently derived by W. Maxwell Tobey which have not yet been published but are in the press at present. They are arranged together with the explanation and the necessary tables in eight sections, which will take up one leaf or two opposite pages of space in *The Journal.* The idea is to have the dividing lines of the sections exactly coincide with each other, so that an engineer can cut the page out of *The Journal* and then cut it along the dividing lines into four pieces, each forming the leaf of a small book, which can then be pasted together and slipped inside of a log book for future reference.

The idea was brought to my mind by one of our Ontario city engineers who wished to get the distance and azimuth between two points of which he had the latitude and longitude only. He set two of his assistants to work it out and it took them two days, and then they were not sure that they were right. If they had had the information I am supplying they could have had the information in fifteen minutes and would have been sure that it was correct.

Yours sincerely,

DOUGLAS H. NELLES, M.E.I.C.

Supervisor of Topography.

Page 1

THE DETERMINATION OF GEODETIC POSITIONS, LENGTHS & AZIMUTHS
by
Douglas H. Nelles, M.E.I.C

The following formulae and tables have been derived and arranged for calculation by W.M.Tobey M.A.,D.T.S.,M.E.I.C. Senior Geodetic Engineer, Geodetic Survey of Canada, with the exception of page 4&5. For the derivation of formulae and fuller explanation see Geodetic Survey of Canada Publication No.7.

When an engineer graduates from the university he generally specializes in some one line of engineering. In furture years he sometimes comes across a problem in another line, needing formulae that he has forgotten,or at any rate has not in a ready shape for calculation. This article gives in an accessable form the latest and best methods of calculating geodetic and plane co-ordinates. They are so arranged that this page of the Journal can be cut out and cut up into four leaves making a small book for the engineer to place inside the cover of his regular book of tables, for ready reference.

Page 2 contains a form for calculating the Latitude and Longitude of a point, when given the distance and azimuth from another point whose Latitude and Longitute is known. No directions are necessary for this calculation as all that it is necessary to do is to follow the numbers of the operation column. The values for the various terms will be found in the tables on pages 6, 7 & 8.

Page 3 contains a form for calculating the length and azimuth of fixed lines, when the latitudes and longitudes of the two points at each end of the line is known.

Page 5 contains a form for calculation of Latitude and Departures and for calculating corrections to the latitudes, departures, lengths and bearings of a traverse when the line closes upon itself or is run between two fixed points, such as triangulation stations.

Page 4 contains a form for the determination of the plane co-ordinates between two points when the Geodetic co-ordinates are given. The formula was derived by Walter F.Reynolds of the U S Coast & Geodetic Survey. The accuracy of the results can be obtained by comparison with the other calculations, as the same line has been used for each. Sometimes it is desired to base the system of latitude and departure co-ordinates upon a line that makes an angle to the meridian passing through the zero point. Operations 20 to 25 show this calculation for an angle of 30 degrees.

Pages 6,7 & 8 contain tables for use in the calculations on pages 2 and 3.

The following publications of the Geodetic Survey of Canada may be obtained by application to the Director at Ottawa, Ont.

- No.1. Precise Levelling, Certain lines in Ontario, Que. & B.C.
- No.2. Adjustment of Geodetic Triangulation in Ontario & Quebec
- No.3. Determination of the Lengths of Invar Base Line Tapes from Standard Nickel Bar No 10233
- No.4. Precise Levelling Certain in Ontario and Quebec.
- No.5. Field Instructions to Geodetic Engineers in Charge of Direction Measurement on Primary Triangulation
- No.6. Precise Levelling Certain Lines in Manitoba and Saskatchewan
- No.7. Geodetic Position Evaluation.
- No.8. Field Instructions for Precise Levelling
- No.9. The Making of Topographical Surveys of Cities and Towns, The First Step in Town Planning

Corporation of Professional Engineers of Quebec.

The annual general meeting of the Corporation of Professional Engineers of Quebec was held on the 29th March, 1922, at Montreal. A large number of engineers from all parts of the Province of Quebec were present. The meeting was presided by A. R. Decary, M.E.I.C., of Quebec, president of the Corporation.

In his annual report for the year 1921, Frederick B. Brown, the secretary of the Corporation, mentioned that the Law governing the practice of the profession of engineering in the Province of Quebec had been amended by the Legislature of Quebec in such a way as to provide for a more efficient control of the practice of the profession.

The Law now provides for the admission into the Corporation, of all graduates holding a diploma from the Ecole Polytechnique of Montreal and the Faculty of Applied Science of McGill University. The Law also provides that the Council may, at its discretion, upon a report made by the board of examiners of the Corporation to the effect that the candidate possesses the required knowledge, capacity and qualifications, admit as a member of the Corporation any person residing in the province and

A. R. DECARY, M.E.I.C.
President of Corporation of Professional Engineers of Quebec.

holding a diploma of civil engineering or the degree of Bachelor of Applied Science from any recognized school or university, or any member of other engineering societies or corporations of professional engineers of like importance, upon presentation of his credentials, and provided he pays the requisite fee for admission to practice. The Council shall also have the power to grant to any engineer, residing out of the Province of Quebec and being the holder of a diploma of civil engineering or of the degree of Bachelor of Applied Science from any school or university, recognized by the Council, or a member of other engineering societies or corporations of engineers likewise recognized by the Council, a temporary licence to practice, upon payment of the fees provided for by the By-Laws, on condition that the actual engineering work planned be carried out in collaboration with an engineer, member in good standing of the Corporation, provided these corporations or societies exact equivalent qualifications for the admission of its members, and that it grants the same privilege to members of the Corporation of Professional Engineers of Quebec.

No person can practise the profession of engineering in the Province of Quebec, unless he is a member in good standing of the Corporation of Professional Engineers of Quebec.

The total number of members up to the 31st December, 1921, was 505. It is now over 700, and it will most probably reach over 1200 within a few months.

The election of the officers and members of Council has resulted as follows:—

President, A. R. Decary; Vice-President, K. B. Thornton; Secretary-Treasurer, Frederick B. Brown.

Members of Council: A. B. Normandin, J. E. Gibeault, J. M. Robertson, Lt.-Col. C. N. Monsarrat and A. Surveyer. Registrar, A. Mailhiot.

LAW GOVERNING THE CORPORATION OF PROFESSIONAL ENGINEERS OF QUEBEC, AND THE PRACTICE OF THE ENGINEERING PROFESSION.

5116 The following expressions in this section have the meanings hereby assigned to them, unless the context otherwise requires:

a. The expression "the Corporation" means the corporation of professional Engineers of Quebec.

b. The expression; "the Council", means the Council of the said corporation;

c. The expression: "member," means a member of the said corporation;

d. The expression "civil engineer," means any one who acts or practises as an engineer in advising on, in making measurements for, or in laying out, designing or supervising the construction of railways, metallic bridges, wooden bridges the cost of which exceeds six hundred dollars, public highways requiring engineering knowledge and experience, roads, canals, harbors, river improvements, light-houses, and hydraulic, municipal, electrical, mechanical, or other engineering works, not including government colonization roads or ordinary roads in rural municipalities; but does not apply to a mere skilled artisan or workman. 61 V., c. 32, s. 1.

5116a. The present members of The Engineering Institute of Canada formerly "The Canadian Society of Civil Engineers," domciled and practising in the Province of Quebec, and all other personi whom they may in the future, join to them according to the provisions of this section, shall form a corporation under the name of "The Corporation of Professional Engineers of Quebec" with all the rights and privileges granted by law to ordinary corporations.

5116b. 1. Its affairs shall be administered by a council composed of eight members elected in the manner provided by the by-laws of the corporation.

2. It shall have the right to adopt by-laws for the proper administration of its affairs; to fix the annual contribution of its members; for the election of the members of the Council; for the guidance, the honour and the dignity of its members; for the admission to study and practice of the profession, in conformity with the provisions of articles 5119, 5120 and 5121; for establishing fees for professional services; for the admission to practice of persons who are members of any corporation or society of professional engineers of the other Provinces of Canada, provided such corporation or society enacts equivalent qualifications for the admission of its members and that it grants the same privileges to members of the corporation of this Province; for its affiliation to The Engineering Institute of Canada, and for all other objects necessary for the proper working of the corporation.

The tariffs of fees hereinabove mentioned shall not come into force until approved by the Lieutenant-Governor in Council and dublished in the Quebec Official Gazette.

5116c. The seat of the Corporation shall be in Montreal.

5116d. The members of the Executive Committee of the Provincial Division of Quebec of The Engineering Institute of Canada, shall form the provisional council of the corporation; they shall, before the first day of June 1920, by a notice signed by the secretary, and addressed, by registered letter, fifteen days in advance, to each of the members, call the first general meeting of the corporation for the purposes of adopting the by-laws thereof, and also to provide for the regular election of the council of the corporation.

5117. No person shall be entitled within the Province, to use the title of civil engineer, or any abbreviation thereof, or any name, title or description implying that he is a corporate member of the said corporation, or to act or practice as civil engineer within the meaning of article 5116, unless he is a corporate member of the Corporation or becomes such under the provisions of this section.

5118. The following are members of the Corporation:

(a) All persons, being practising civil engineers within the Province on the fifteenth day of January 1898 who, within one year therefrom, applied for admission to and paid the subscription fees required under the by-laws of the Corporation;

(b) All persons who, having been admitted to study under the provisions of this section, shall have passed the prescribed examination and shall have been licensed as civil engineers by the Corporation;

(ba) All persons having the right to use the title of Civil Engineer under an act of the Province of Quebec.

(c) All persons, being members of the Corporation of Land Surveyors of this Province, on the fifteenth day of January 1898, who apply for admission to the corporation and pay the subscription fees required under its by-laws;

(ca) The Engineers who, on the 31st of December, 1917, were active members of any recognized society of Civil Engineers and who resided and exercised their profession in the Province of Quebec during the four years preceding such date, provided that they have their names and addresses entered in the registers of the corporation before the 1st of March, 1921.

(d) Whosoever shall establish to the satisfaction of the Council that he was not a resident of this Province, on the fifteenth day of January 1898; that by reason of such absence he could not comply with the provisions of the law or give the periods of study and service required in the office or service of a corporate member of the corporation; that he has, however, been practising as a civil engineer, within the meaning of this section, for not less than ten years, and that he is a member of the highest grade of the Institute of Civil Engineers or of any other national engineering society of similar standing; and gives one month's notice, and, at the same time, pays the corporation the sum of fifty dollars, and passes the examination prescribed in paragraph (e) of article 6. 61 V., c. 32, s. 3; 2 Ed. VII, c. 25, s. 1.

5118a. The Council shall admit as a member of the corporation any person domiciled in the Province, who holds a diploma of civil engineering or the degree of Bachelor of Applied Science from the Polytechnic School of Montreal or the Faculty of Applied Science of McGill University, obtained after the 1st of March, 1922, provided that such person has been registered as a student member of the corporation during four years. The four years of clerkship required will not apply to students who are registered in the above-mentioned school and university on the 1st of March, 1922.

5118b. The Council may, in its discretion, upon a report made by the examiners of the corporation to the effect that the candidate possesses the required knowledge, capacity and qualifications, admit as a member of the corporation any person residing in the Province and holding a diploma of civil engineering or the degree of Bachelor of Applied Science from any recognized school or university, or any member of other engineering societies or corporations of professional engineers of like importance, upon presentation of his credentials, and provided he pay the requisite fee for admission to practice.

5118c. The Council shall have the power to grant to any engineer, residing out of the Province of Quebec and being the holder of a diploma of civil engineering or of the degree of Bachelor of Applied Science from any school or university, recognized by the Council, or a member of other engineering societies or corporations of engineers likewise recognized by the Council, a temporary license to practise, upon payment of the fees provided for by the by-laws, on condition that the actual engineering work planned by carried out in collaboration with an engineer, member in good standing of the corporation.

5119. There shall be a board of examiners, of not less than six persons, who shall be resident in the Province, to examine candidates for admission to the study, or for admission to the practice of civil engineering.

Four members of this board, two of whom must have the proper qualifications and competency to examine all candidates for preliminary and final examinations in French or in English, at the option of the candidate, shall be appointed by the council, one member by McGill University, and one by the Polytechnic School.

The board shall meet at least twice each year, at the cities of Quebec and Montreal, alternately, on the first Tuesday in May and November. 61 V., c. 32, s. 4.

5120. 1. A candidate for admission to study shall:

(a) Give one month's notice to the secretary of the corporation of his intention to present himself for examination, and at the same time shall pay such secretary the sum of twenty dollars as fee, one-half of which shall be remitted in the event of failure to pass the prescribed examination;

(b) Produce a certificate of good character;

(c) Pass an examination in the following subjects, viz. grammar and composition, in either English or French, geography, that of Canada in particular, history of Canada, arithmetic, elements of geometry, use of logarithms, algebra up to and including quadratic equations, trigonometry up to and including the solution of plane triangles.

2. If successful, the candidate shall be entitled to a certificate that he has passed such examination.

3. If, on the fifteenth day of January 1898 the candidate holds a certificate of having been admitted to study as a provincial land surveyor, then such certificate shall be accepted in place of the foregoing examination.

2a. The junior members of the Engineering Institute of Canada, domiciled in the Province on the 1st of April 1922, may, in the discretion of the Council, be admitted as members of the Corporation after having taken the examination for admission to practice, providing they have their names and addresses entered in the registers of the Corporation before the 1st of March, 1923.

3. All examinations shall be conducted in French or English at the option of the candidate. 61 V., c 32, s. 6.

5122. Any student who has passed the examination prescribed by this section shall be entitled to receive a diploma and shall become a corporate member of the corporation. 61 V., c. 32, s. 7.

4. If the candidate holds a degree of Bachelor of Applied Science, Bachelor of Arts, Bachelor of Sciences, or Bachelor of Letters, conferred upon him by a university recognized by the Council, or has graduated from and holds the diploma of the Royal Military College, or proves, to the satisfaction of the Council, that he has passed the examinations for admission to study in an engineering school or university, recognized by the Council, or holds a diploma as provincial land surveyor in this Province, he shall, on making satisfactory proof that he is the person named in such degree or diploma, be entitled, on payment of the above mentioned fee, to receive a certificate permitting him to study.

5. The student members of the Engineering Institute of Canada, domiciled in the Province on the 1st of March 1922, shall be entitled to a certificate of admission to study, counting from the date of their admission in the Engineering Institute of Canada, providing they make application therefor before the 1st of March 1923.

6. Every student must perform the clerkship exacted by the provisions of this section, under indentures entered into with an engineer member of the corporation, which indentures shall be passed before a notary, as well as any transfer that may be made thereof, and an authentic copy of same must be deposited with the registrar. The period of clerkship shall count only from the date of registration with the registrar of the corporation.

5121. 1. A candidate for admission to practice shall:

(a) Give one month's notice of his intention to present himself for examination and at the same time, pay the secretary the sum of forty dollars, as a fee:

(b) Produce a certificate of good character;

(c) Establish that he is at least twenty-one years of age;

(d) Establish that, since his admission to study, he has been engaged in the pursuit of civil engineering in the office or in the service of a corporate member of the society for a period of at least five years, or for a period of two years if he holds a diploma as a provincial land surveyor.

(e) Pass an examination before the board of examiners of the society on the theory and practice of civil engineering, and especially in one of the following branches at his option: railway, municipal, hydraulic, mechanical, mining or electrical engineering.

2. Indentured pupils of civil engineers, on the fifteenth day of January 1898 who, within six months thereafter, registered their indentures with the corporation and paid the admission fees, shall, upon the completion of the full term of five years, be admitted to practice on passing the preliminary and final examinations as herein prescribed.

5123. No by-laws, passed or that may be passed , by the corporation, shall have force or effect in this Province until approved by the Lieutenant-Governor in Council. 61 V., c. 32, s. 8.

5124. No person practising the profession of civil engineer, and not entitled to do so under this section, shall recover before any court of justice any sum of money for the professional services rendered in such capacity. 61 V., c. 32, s. 9.

5125. Any person, not being a member in good standing of the Corporation of Professional Engineers of Quebec, who:

(a) Practises the profession of civil engineer; or

(b) Usurps the functions of the profession; or

(c) Assumes verbally or otherwise the title of civil engineer or makes use of any abbreviation of such title, or of any name, title or designation which might lead to the belief that he is a civil engineer or a member of the corporation; or

(d) Advertises himself as such in any way or by any means; or

(e) Acts in such manner as to lead to the belief that he is authorized to fulfill the office of or to act as a civil engineer,—shall be liable, on summary conviction, to a fine of not less than one hundred dollars nor more than two hundred dollars, and, on failure to pay the same, to imprisonment for not more than three months, for the first offence, and for any subsequent offence, to a fine of not less than two hundred dollars nor more than five hundred dollars , and, on failure to pay the same, to imprisonment for not more than six months.

5126. Nothing in this section shall be deemed to encroach upon the rights and privileges conferred upon provincial land surveyors by any act of the Legislature. 61 V., c. 32, s. 11.

Preliminary Notice

of Applications for Admission and for Transfer

20th April, 1922

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer rom one grade of membership to a higher.

It is also provided that there shall be issued to all corporate member a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in May, 1922.

FRASER S. KEITH, Secretary.

---

*The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the fo lowing branches at his option, Railway, Municipal, Hydraulic, Mechanical, Mining or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidat. has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years oe age, and must have been engaged in some branch of engineering for at least four yearsf This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects, Geography, History (that of Canada in particular), Arithmetic, Geometry Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits cientific acquirements, or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

> The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BARLOW—ARTHUR, of New Aberdeen, N.S. Born at Denaby, England, May 5th, 1891; Educ., D.S.C.R. course in surveying, 1920. Military aeronautic school courses, 1918; N.S. Technical mining school, Oct. 1920 to date. Granted overman's certificat. 1921; 1908-10, rodman, N.T.C. Rly.; 1911-12, rodman in mines, Denaby Collieries England; 1915-16, attached field survey co'y. Royal Engrs. as levelman. Commissioned, R.A.F., 1919; Nov. 1920 to date, employed in mining engr's dept., Dominion Coal Co., Glace Bay, N.S.

The Self-Corrosion of Buried Lead Pipes

An Investigation into the corrosion of buried lead pipes in Winnipeg and vicinity, with Laboratory Experiments on the self-corrosion of lead.

W. Nelson Smith, M.E., M.E.I.C.,
Consulting Electrical Engineer, Winnipeg Electric Railway Company.,

and

J. W. Shipley, Ph.D., F.C.I.C.,
Assistant Professor of Chemistry, University of Manitoba.

Paper read before the Winnipeg Branch, The Engineering Institute of Canada, April 6th, 1922.

Reasons for the Investigation.

The occasion of this inquiry into the self-corrosion of lead was the destruction, regardless of location, of a considerable number of lead water service pipes in various parts of the city of Winnipeg. For lack of any more scientific analysis, the damage had formerly been attributed solely to leakage of stray current from the electric railway system but the indisputable fact that a number of these cases of damage had occurred in place either remote from railway substations or at a considerable distance from any grounded metallic conductor of lower potential, coupled with the fact that the clay and limy silt soils of the entire region are thoroughly permeated with solutions of alkaline salts, prompted the suspicion that stray current could not always be blamed for the corrosion and provided a sufficient incentive to investigate the action of these salts upon metallic lead in the absence of outside impressed electromotive forces.

The present paper is intended to comprise a general review of facts derived from local observations by ourselves, and from observations by others on the corrosion of lead, placing the same alongside of the experiments we undertook to demonstrate the conditions under which the self-corrosion of lead takes place in the alkaline soils at Winnipeg and vicinity.

Ever since the electric railway came into existence, more than thirty years ago, it has been usual to assume that stray railway current is the first thing to suspect, in accounting for the corrosion of buried pipes. It is a very convenient theory: first, because it has acquired considerable prestige by having been frequently proved to fit the facts; second, because the unknown locations and resistances of invisible underground paths for railway return

current immediately suggest that anything becomes possible when a stray current in the earth seeks and finds the path of lowest resistance back to the nearest station.

It has also been easy for scientific experts to take the stand that the natural difficulties of the situation make it impossible to make measurements that are not misleading. Consequently, there has developed a habit of neglecting the fundamental necessity of proving the positive polarity of a metal pipe to the surrounding earth, which is admitted by the experts to be a prerequisite to the possibility of the said pipe being corroded by the leakage of stray current. To ignore the necessity of this proof, is like having one's cake and eating it too.

However, it has at least been recognized that a test of polarity, or its equivalent is a scientific necessity. Furthermore, as the study of electro-chemistry has been considerably advanced in the past thirty years, it is now possible to deal on an electro-chemical basis with a problem that is electro-chemical, if it is anything.

In a former paper* was demonstrated the fallacy of believing cast iron indestructible under all conditions when buried in the ground. The present paper is prepared in order to set forth corresponding facts about metallic lead, and to show the paramount importance of determining the polarity of buried pipes to the surrounding earth, before attempting to fasten the responsibility for their corrosion upon stray railway current.

Indications of Self-Corrosion on Pipes in and about Winnipeg.

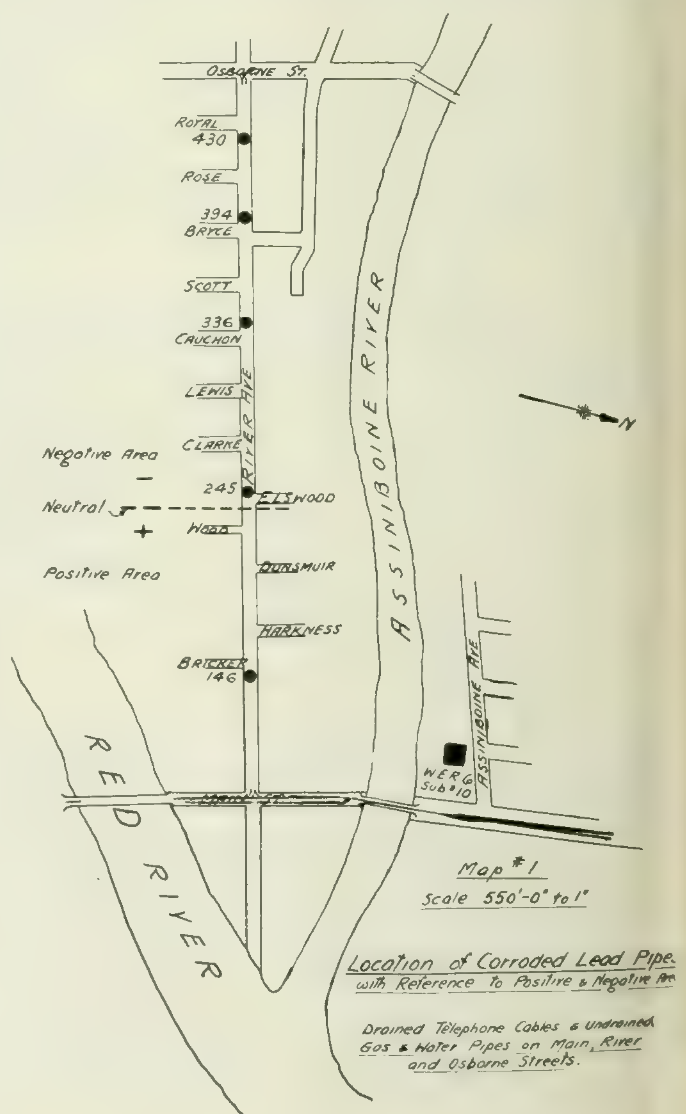
Pipes have corroded at various times in the past at a number of places scattered indiscriminately over the city, in localities where the electrical polarity of pipes to earth, if there was any at all, must have been negative, insofar as concerns the general direction of whatever stray current may have existed.

In a negative district, it has to be admitted that whatever stray current there may be tends to flow *into* underground conductors, and not *out* of them. If cables are present which are drained to a power station it is sometimes possible for pipes to be positive to cables, but the cables cannot even then be claimed to endanger the pipes unless they are within a few feet of them, as in the case of a cable conduit running over a service pipe where the latter crosses the street. The Winnipeg soil is of such low average resistance that it tends to cause a much smaller flow of stray current in underground pipes than would otherwise be the case.

Generally speaking, as much or more pipe corrosion has occurred in negative or neutral than in positive districts, irrespective of whether underground cables were near or distant. Observation of pipes exposed in River avenue was of considerable interest in this connection and is here referred to in some detail because of the evidence, offered by both iron and lead pipes, that some other cause than stray current is responsible for most of the corrosion observed.

*Self Corrosion of Cast Iron and Other Metals in Alkaline Soils,—The Engineering Journal—The Journal of the Engineering Institute of Canada, October, 1921.

In June 1921, the city Water Department changed a the service pipes on River avenue from the old four-inc cast iron main installed prior to 1890, to a newer six-inc main installed about 1916, affording excellent opportun ities for examining both the iron and the lead pipes Careful examination was made jointly by representative of the city and the railway. The lower end of Rive avenue, east of Elswood street, had probably been in positive area with respect to the old railway substatio on Assiniboine avenue, but west of Elswood street th pipes were shown, by a survey made as long ago as 1914, t have been negative to the rails. Nevertheless, the iro mains were corroded more or less indiscriminately withou regard to their location along the street; some of the wors corrosion being at the west end of the street furthes from the former positive area, in spots where the soi were found to be heavily charged with alkaline salt The observed cases of incipient corrosion of lead pipe (all the services in the street were examined), include only one at the east end of the street in the former positiv area, and four in the western portion in the former negativ

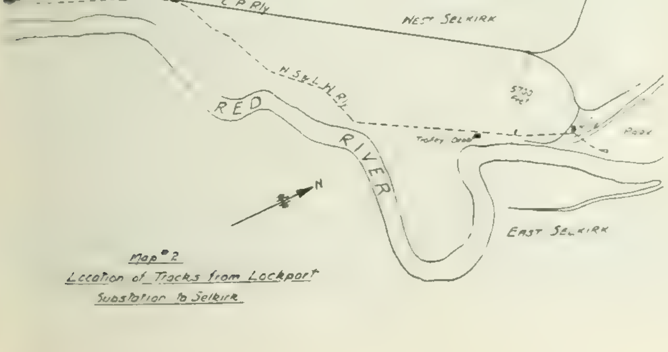


area, being respectively west of Elswood, Cauchon, Bryce and Rose streets. The damage to the iron pipes was not all confined to the bell and spigot joints, which might have been expected had the pipe been actually known to carry any quantity of stray current, but was observable *anywhere* along the pipe. Some of the damage on the iron pipes appeared in the form of a groove, encircling the pipe, which bore every evidence of having been the sling mark of the rope used in lowering the pipe into place. This feature has been observed on corroded iron pipes in many other localities about the city and points conclusively to soil corrosion as the cause of this form of disintegration of the wall of the iron pipe.

Neither was there any definite relation between the corrosion of the lead pipes and those of the cast iron mains. At some points examined the iron pipes were found to be badly attacked, and the lead service pipes connected thereto showed no evidence of corrosion whatever; while in other excavations, the lead service pipes were corroded right up to the iron mains and the latter showed no marked signs of damage at that particular spot.

It has been found in other cities that, on cast iron mains known to be carrying stray current, pitting is unmistakably present at and near the joints while absent between joints. This is because of the usual higher resistance of lead-caulked joints which diverts stray current from the pipe into the surrounding earth and corrodes the pipe for a distance of one to two feet back of the joint.

The occurrence of corrosion here and there on the River avenue water mains, without regard to location of the pitting with respect to pipe joints, shows that the pipe cannot have carried any appreciable amount of stray current, although it lay in the same street with the oldest electric railway line in the city. The absence of destructive corrusion in the lead service pipes, which cross the street directly under the electrically drained telephone cables which run along the centre of the street, also shows that these cables, although their sheaths undoubtedly conducted some current to the substation, could not have been draining any appreciable amount of stray current out of either the mains or service pipes in the street. Otherwise there would have been extensive and continual damage to the lead service pipes crossing the street, which has never been the case so far as our records indicate. Lead is more than three and one-half times as sensitive to stray current corrosion, as cast iron,



Map No. 2
Location of Tracks from Lockport Substation to Selkirk

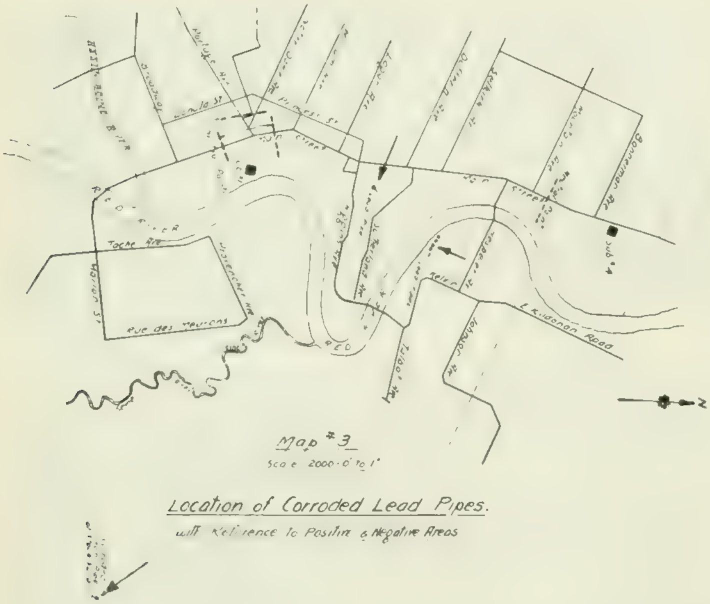
so that the absence of its destruction where it would be most expected, within 1,500 feet of the oldest power station in town, is fairly good evidence that stray current has played little if any part in the corrosion observed in this street. In the following tabulation of observed corroded spots, only the first location has been in an electrically positive area.

Table A.—Points at which corrosion was observed.

Location	*Date*	*Remarks*
At Bricker street.	June 9, 1921	Lead pipe badly pock-marked. Soil dark limy silt, not saturated. Moisture in soil 22½% and 17½% for 2 samples.
At Elswood street.	June 16, 1921	Lead pipe covered with black deposit. Soil mixed limy clay loam, wet.
At Cauchon street.	June 18, 1921	Black warts on lead service pipe. No corrosion on iron pipe. Soil clay with limy silt, wet.
At Bryce street.	June 23, 1921	Lead pipe showed black carbuncles and white incrustation in pock-marks. Soil dry limy silt.
At Rose street.	June 25, 1921	Lead pipe blackened for 18 inches from water main, clean beyond. Soil very limy dry silt. No corrosion of iron pipes.

In January 1921, a lead pipe was uncovered at the Mental hospital in Selkirk, Manitoba, which had been recently perforated by corrosion, The perforated section was not available but the pipe was uncovered close by and corrosion was found to have started on the section which was examined. While the corrosion had not proceeded to any depth, it had gone far enough to disintegrate the exterior surface of the pipe and some particles of the surface metal were adhering to the matrix of the soil on the pipe. This corroded material was a lead compound insoluble in dilute nitric acid, presumably lead peroxide, P_bO_2, but there was not enough of it to make an analysis. The soil about the Selkirk hospital is mostly of the character of limy silt or disintegrated pulverized limestone, and there was also evidence of decaying organic matter in the backfill. The section of pipe that had been actually perforated, had unfortunately been lost before this investigation, but the section of pipe secured was certainly corroded.

The isolation of the Selkirk hospital waterworks system is of itself a sufficient guarantee of the impossibility of stray current being responsible for pipe corrosion, as stray current would have to double back on its own track to get into the pipes and out of them again in order to be held responsible for the corrosion. (see Map No. 2) A delicate galvanometer test failed to disclose any evidence of stray current



Location of Corroded Lead Pipes.
with reference to Positive & Negative Areas

Almost equally striking are four cases which occurred in Elmwood, across the Red river from Winnipeg, (see Map No. 3). These were all lead service pipes on the same street, (Riverton avenue), from five hundred to one thousand feet distant from the nearest track, which was in a distinctly negative area, one and one-quarter mile distant from a substation in either direction, and with no gas pipes in the district and no telephone cables within one thousand feet, to which any stray current could possibly leak from these pipes. The cast iron water main on that street has never required repairs. The soil here is also of the limy silt character so frequently observed in connection with most cases of lead pipe corrosion. With the electric railway distribution conditions identically the same as at the time the pipes were perforated, the galvanometer test for polarity at this spot showed the water main distinctly negative to the earth.

The polarity tests above mentioned were made with the equipment suggested by the United States Bureau of Standards, which comprises a pair of non-polarizable terminals and a high resistance galvanometer of the Leeds and Northrup portable type. The two galvanometer terminals are of copper enclosed in insulating bushings of bakelite with the open ends protected with plugs of Portland cement, which prevent the copper terminals from being affected by abrasion or oxidation. The two terminals are mounted about eight inches apart at the end of a piece of gas pipe through which the galvanometer leads are carried, the pipe being lowered into an augerhole bored in the ground almost down to the pipe. The presence and polarity of any appreciable difference of potential between pipe and earth is thus very promptly indicated by the galvanometer.

It should be understood that the cases of lead pipe corrosion, observed on River avenue, were all in very early stages, none being far enough advanced to require repairs. The cases herein reported from other localities, in and near Winnipeg, by no means cover the total corrosion damage but are simply the most outstanding instances of damage where the evidence preponderated in favour of self-corrosion and against the possibility of stray current corrosion.

Other Reported Cases of Self-Corrosion of Lead.

Lead pipes have been used for conveying water for many centuries. They are known to have been used in Rome about the year 100 A.D. In 1236 London was supplied with water from Tyburn which was brought through a lead pipe. In more modern times, since the art of casting iron into pipe was developed, the advance of chemical and medical science has brought about greater caution in the use of lead for water supply piping, as it has sometimes been found to be soluble in available surface waters and the soluble salts of lead are all too poisonous to be permissible in a city water-supply. Consequently, a large part of the research on the corrosion of lead has been more along the lines of ascertaining the causes of internal corrosion of lead pipes, rather than external corrosion.

References to the external corrosion of lead are not frequent in engineering literature, but a persistent search has nevertheless disclosed some recorded facts of interest. The following is from the Journal of Gas Lighting, November 26th., 1912, published in Berlin, Germany:—

> "Corrosion of Lead Pipe.— Lead pipe corrosion of a somewhat unusual nature was observed on some sections recently uncovered in the grounds of the Technical High School at Charlottenburg. The pipe had been in the ground for about twenty-four years, part of it being unprotected and part embedded in a cement foundation. The unprotected portion was found to be in a practically perfect state of preservation but the other part showed a peculiar transformation. The contact between the pipe and the cement was not uniform and where the pipe entered the mass the lead was transformed into a hard compact yellow-red substance. When this was removed and a section of the pipe not affected in this way was exposed, the latter was found to have a scarred surface, with silver-white lustre, which rapidly changed to a dull grey in air. The pipe was 0.7 inch in diameter and about 0.2 inch thick. An examination of the affected section showed the transformed mass to be made up of concentric alternating red and yellow layers, twenty four red and twenty-three yellow, or one pair for each year the pipe lay in the cement. Analyses showed the two substances were the low and high oxides of lead, (PbO and Pb_3O_4), and the supposition was that the seasons influenced the formation of the oxides. Thus, during the months of high precipitation more active oxygen would be present, which would result in forming the higher oxide, (Pb_3O_4), while the lower one would be deposited in the drier season." *Journal of Gas Lighting, 120, 669, November, 26, 1921.*

An article by Mr. Richard H. Gaines, chemist of the New York Board of Water Supply, published in the Engineering Record in June 1913, mentions a number of instances of the self-corrosion of lead. One case was that of lead pipes in contact with a wet concrete floor, in a bath house in Brooklyn, which resulted in the hot water pipe

being nearly destroyed in five years and the cold water pipe deeply corroded. Another instance was given of lead pipes in a suburb of New York city, not exposed to stray current, becoming so badly pock-marked that they had to be replaced. Another instance was given of the grease on cartridges having converted lead bullets into white lead, the expansion of which had burst the cartridge shells by the resulting increase in volume of the lead. The lead of old coffins had been found converted into a mixed mass of metallic lead and basic carbonate. Mr. Gaines described some experiments which consisted in embedding samples of different metals in damp concrete for a period of two months. Where the metals were separated from each other, the lead lost 11.99 grams per square foot, while manganese bronze lost only 0.32, steel 0.135, copper 0.64 and monel metal 0.04 gram. With steel, lead and copper in contact, the lead lost 6.77 grams, the steel 2.48 grams and the copper 0.31 gram per square foot. Mr. Gaines also recorded information ascertained from a Russian engineer who visited the United States some years ago, who stated that lead pipes forming a part of the water-supply system in a section of St. Petersburg, laid about 1860, had corroded to destruction by some time in the seventies. This was attributed to soil corrosion, as it was years before the days of applied electricity and stray currents were out of the question.

Messrs. Scofield and Stenger, in an account of their research upon self-corrosion of metals published in the Electric Railway Journal of November 14th, 1914, cited a case, of which a photopraph was given, exhibiting the corrosion of a lead pipe that had been buried in contact with a mixture of earths of different character. The corrosion is so distinct as to leave no doubt of the corrodibility of lead under such conditions. These experiments were conducted with soils from the vicinity of Minneapolis, Minnesota.

The corrosion of lead pipes by pure distilled water is an occurrence well known to chemists, though not so well known to engineers, and an example is available of a lead plate actually corroding in distilled water, corrosion being well advanced in several spots after about four months immersion.

The writers once came across an instance of internal corrosion by condensed steam in heating coils made of extra heavy lead pipe, and used for heating phosphoric acid in a chemical works by means of live steam conducted through the pipes. The drip, or condensate, from these pipes carried a cloudy precipitate which proved to be chloride of lead. No phosphoric acid was present, showing that the pipe had not been perforated by the acid to which it transferred heat. There was known to be a slight amount of chlorine in the boiler feed-water and this was thought to account for the precipitate of lead chloride observed in the condensate.

Causes of Self-Corrosion of Lead Compared with the Natural Conditions. Where it occurs.

Pure water, especially when containing dissolved oxygen, can dissolve lead, forming lead hydrate, and the CO_2 from the air or any other source changes this hydrate into insoluble basic lead carbonate. This carbonate may form a thin film which acts as a protection against further action, but further conditions may arise which cause the action to be continued. The course of these reactions may be represented by the following chemical equations:

$$Pb + O = PbO$$
$$PbO + H_2O = Pb\,(OH)_2$$

$$3\,Pb\,(OH)_2 + 2CO_2 = 2\,PbCO_3.\,Pb\,(OH)_2 + 2H_2O.$$

If a soluble sulphate is present, some of the hydrate may be transformed into lead sulphate, in accordance with the following equation

$Pb(OH)_2 + MSO_4 = PbSO_4 + M(OH)_2$ where M may represent calcium or any other base forming metal. Lead sulphate is very little soluble in water at ordinary temperature.

The hydrate condition may be said to represent the tendency of lead to form a basic compound. This tendency to form a compound with an acid radical is instanced by the so-called Dutch process of manufacturing white lead, in which metallic lead is the raw material and is deliberately corroded into the carbonate, which is the white lead of commerce. The Dutch process consists of placing a strip of lead around the upper inside of an earthenware jar containing acetic acid in the bottom. This jar is buried in manure or rotten tan bark for about twelve weeks when the lead is found to be completely transformed into white lead, which is basic lead carbonate. The decomposing organic matter produces heat which volatilizes the acetic acid and the acid vapour attacks the metallic lead, the first product being the lead acetate. The decomposing organic matter at the same time produces CO_2 ,which acts upon the lead acetate, turning it into lead carbonate. The reactions are as follows:—

(1) $2HA + 2Pb + O_2 = PbA_2.Pb\,(OH)_2$ (basic lead acetate)

(2) $3[PbA_2.Pb(OH)_2] + 2CO_2 = 3PbA_2 + 2PbCO_3.PbOH_2 + 2H_2O$

(3) $2PbA_2 + 2Pb + O_2 + 2H_2O = 2[PbA_2.Pb(OH_2)]$

A small amount of acetic acid will thus serve for the manufacture of an indefinite amount of white lead. The same lead acetate is constantly ready to combine with lead and oxygen over and over again.

It is thus evident that both pure water and decomposing organic matter are capable of corroding lead, each in a manner slightly different from the other, but the final product under these circumstances is invariably a mixed carbonate and hydrate of lead, sometimes with sulphate of lead present if soluble sulphates are present in the soil. Lead is less easily corroded by the stronger mineral acids than it is by the weaker organic acids and the evolution of the latter, by the decomposition of organic matter, probably accounts for the initial acid action in starting corrusion of the lead; but as carbon dioxide is evolved by the same decomposition, the final products of the corrosion appear as basic lead carbonates, just as in the case of the deliberate corrosion of lead by the Dutch process of white lead manufacture.

From observations, in and about Winnipeg, it appears that the corrosion of lead is most likely to occur where the soil is of the limy silt character and lighter in colour than the dark olive-brown stratified clay which is so often

heavily loaded with the sulphates of calcium and magnesium. Apparently the soil does not have to be highly saturated with moisture in order to be corrosive. The cases in Selkirk and in the Elmwood district, above recorded, were in comparatively dry limy silt soils.

A particularly suspicious locality is on Maple street, (see Map. No. 3), where the service pipe, supplying the stable of the Vulcan Iron Works, has been destroyed several times. This is in a distinctly negative area two or three blocks from the nearest car track and about half a block from the nearest underground cable. Being in proximity to a stable, where the soil can be presumed to be more or less polluted with decomposing organic matter, would undoubtedly account for the evolution of the organic acid ingredients that would attack lead.

Some other cases of lead pipe corrosion, that have occurred near electric power stations, have also been in the same type of light coloured limy silt soil, not always dry, and with sulphates and chlorides present also. The products of corrosion adhering to the pipes in the latter places were sulphates and carbonates of lead.

This paper will be continued in the July issue of *The Engineering Journal.*

220,000-Volt Transmission and Apparatus

The Field of Application of 220-kilovolt Transmission, Description of Equipment, and Reference to Two 220-kilovolt Systems under Construction in California.

J. F. Peters, Member A.I.E.E.

Paper read before the Hamilton Branch, The Engineering Institute of Canada, March 24th, 1922.

The rapid increase in demand for electric power is requiring rapid increases in transmission voltages. Twelve or fifteen years ago an operating voltage of 100,000 volts was rare, today 130 kv., is common and 150 kv., is being used rather extensively. Recently 220 kv. transmission has been the subject of considerable discussion. At the present time two companies on the west coast are building 220 kv., lines and are installing apparatus to operate at that voltage. A logical choice for the next step in the transmission schedule appears to be 220 kv., because from an appraisal of the general situation, a voltage of this order is adequate for the present needs and commensurate with expected growth in transmission service for some time. The numerical value of 220,000 is in accord with the well established practice of standardizing in multiples of 11,000.

The field of 220 kv., is perhaps not broad; its commercial application is primarily to large blocks of power and long transmission distances. Power from large hydro-electric stations or from steam-electric stations, in coal fields, would advantageously be transmitted over 220 kv., lines to terminal substations at important load centers and then be distributed at intermediate voltage of 66 kv., or 100 kv. A 220 kv., system, with the generating stations for which it would be the outlet represents a tremendous amount of power. The economical importance of relialibity and continuity of power, in view of the great volume of industrial enterprises and public utilities which would depend on it, is of so high an order that more than usual care in the design and construction of the line and connected apparatus is justified. The neutral of the system should be solidly grounded. Transformer neutrals at all connected points should be solidly grounded on the 220 kv. side. This not only shows a distinct gain in dependability of operation but has considerable effect on the requirements of the line and the size, cost, and performance of connected apparatus, especially transformers. When the neutrals of all transformer banks are solidly grounded, the neutral end of each transformer phase remains at ground potential at all times, therefore very little insulation is required between this end of the high voltage winding and iron. The line ends of the phases remain at star voltage above ground when one line becomes accidentally grounded, whereas if the neutral is free or grounded through an appreciable impedance the neutral end of the phases would go to approximately star voltage above ground and the line end to line voltage, or $\sqrt{3}$ times star voltage from ground. Therefore solidly grounding the neutral not only decreases the necessary insulation on the neutral end to approx-

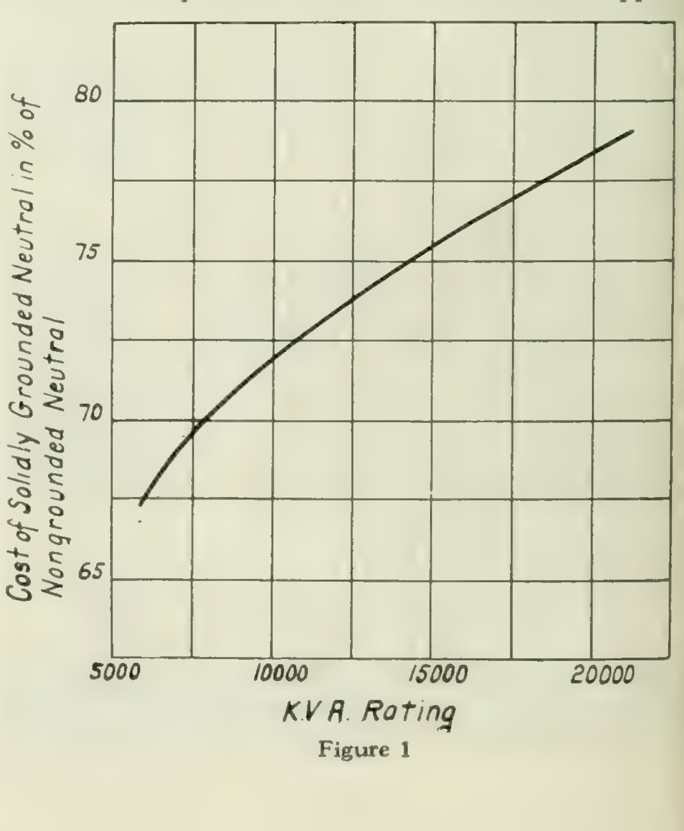


Figure 1

imately zero, but it decreases the necessary insulation at the line end considerably. It has become more or less standard practice to give transformers for solidly grounded neutral service an insulation test of 2.73 times star voltage instead of 2 times line voltage, or 3.46 times star voltage, which is the standard test for transformers not having their neutrals solidly grounded; the tests for grounded neutral units being by an induced voltage.

Figure 1 shows the relation between cost of 60-cycle, 220 kv., transformers for solidly grounded neutral service and transformers that have their neutrals grounded through comparatively high resistance. This curve applies to shell type transformers, but the relative costs of core type transformers are approximately the same. The difference between the grounded and ungrounded neutral transformers is a function of both voltage and capacity. It becomes more marked as the voltage increases and capacity decreases.

Transformers for 220 kv., should be built in as large units as possible as their costs per kv. a., at such voltages decrease very rapidly as their kv. a., ratings increase. They should be single-phase so as to facilitate shipping and handling. Three-phase units of large ratings show practically no saving in cost and efficiency over three single-phase units having the same bank capacity and are difficult to handle.

When transformers are located in substations where synchronous condensers are installed it is often possible to effect a considerable saving by having the transformer which would be required for the synchronous condensers combined with the main step-down transformer. When the condenser is supplying leading kv. a., and the main load is at lagging power factor, the two loads combine to reduce the current in the primary so that the addition of the condenser winding will not increase the size of the primary winding as long as the condenser does not exceed twice the reactive component of the main load. If the condenser load were maintained at all times it would even be possible to reduce the size of the primary. This is seldom the condition, however, and it is therefore the practice to design the primary so that it will carry full load with the condenser shut down.

Figures 2 and 3 show a 16,667 kv. a., single-phase, 60-cycle transformer unit designed for solidly grounded neutral service. Seven such units were built by the Westinghouse Electric and Manufacturing Company for the Pacific Gas and Electric Company, and are for 220 kv. service. Recently the Westinghouse Electric and Manufacturing Company has received an order from the Southern California Edison Company for six larger units. They will be 36,700 kv. a single-phase, 50-cycle,

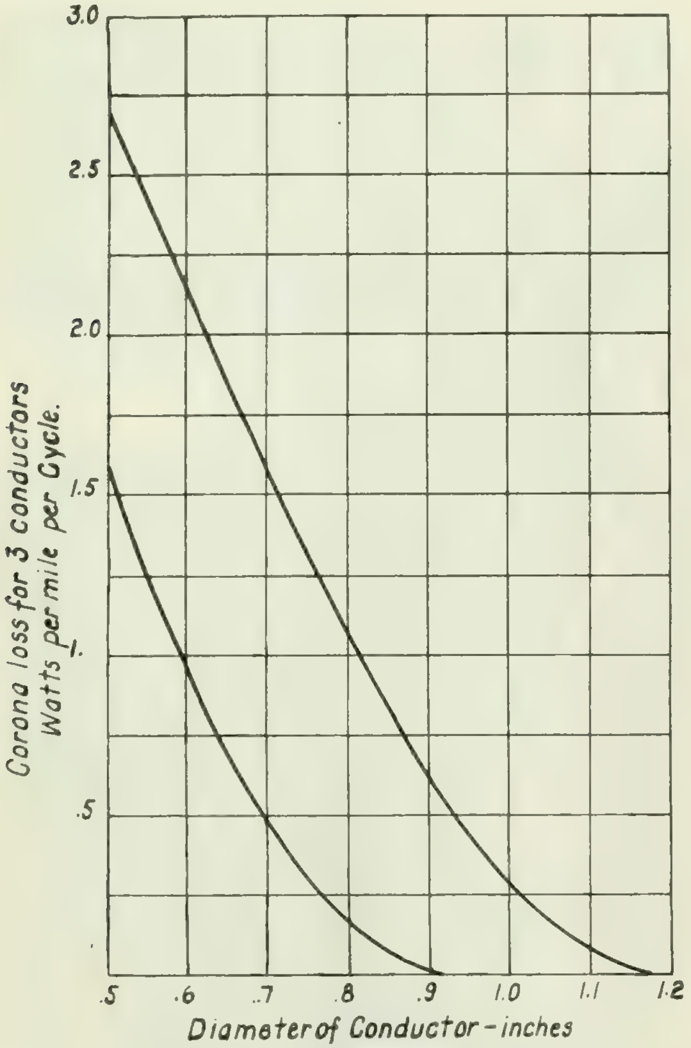

Figure 4

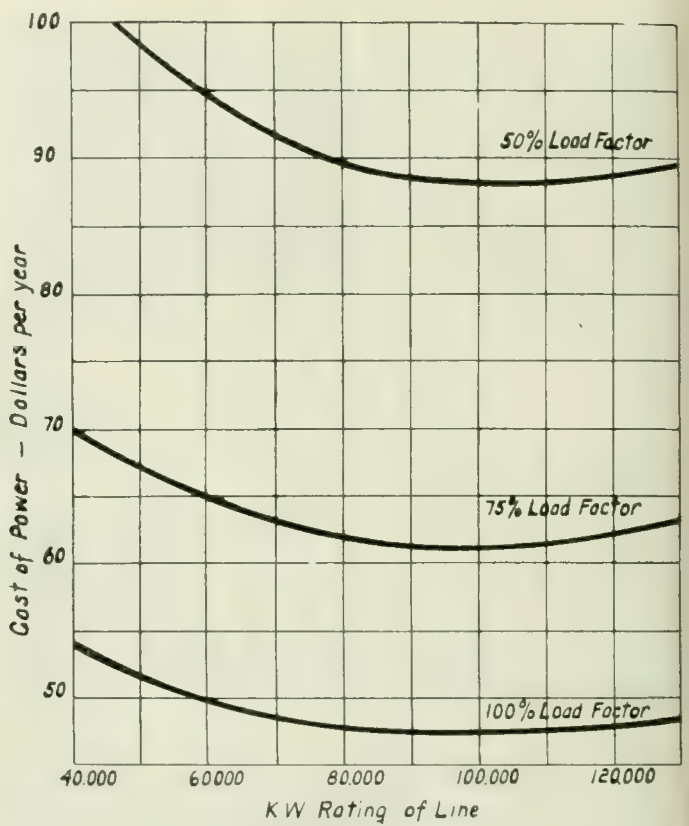

Figure 5

220,000 to 150,000 volts, and will be of the shell type construction.

There are many details that must be carefully considered in designing the lines for 220 kv., transmissions. Some of these, such as length of span, tower design, material in conductors, etc., will not be discussed in this paper. It will be confined more to the electrical features.

One of the primary considerations in selecting the conductor for 220 kv., transmission is corona formation and corona loss. This subject has been extensively treated by F. W. Peek, Jr., and others. In Figure 4, is plotted corona loss against diameter of conductors for both fair weather and storm conditions. These data are based on a flat conductor spacing of 15 feet, 1000 feet altitude, 28.7 inches barometer, pressure irregularity factor, 0.85, storm factor 0.8, temperature 50°F., and give the loss per mile for three conductors per cycle. These curves indicate that the conductor should not be less than approximately 1 inch in diameter.

It is always necessary to maintain approximately constant voltage at the receiver end of transmission lines. This is accomplished by means of synchronous condensers, generally located at the receiver end. In some cases, for very long lines, it may be found necessary to distribute the condenser capacity along the line at several points. Two hundred and twenty kilovolts does not introduce any new problems in connection with voltage control: it merely requires greater condenser capacity.

Since the smallest conductor that can be used on account of corona formation is fairly large and, when made in the usual form and of aluminum or copper, has considerable current capacity, it is interesting to determine the amount of power that can be most economically transmitted over the smallest conductor permissible, due to corona formation. The curves in Figure 4 indicate that the conductor should not be less than approximately 1 inch in diameter. Data were prepared and plotted in Figure 5 on the variable factors that enter into the cost of power transmitted 200 miles from the hydro-electric station over one circuit at 220 kv., 60-cycles. These data are based on the following:

Conductor: aluminum steel, 1.092 inch diameter, 0.115 ohms per mile.

Spacing: 15 feet flat.

Supply voltage: 220 kv.

Receiver voltage: 220 kv.

Cost of losses: 0.5c per kw. hour.

Capitalization: 15%.

Cost of station, including generators: $200 per kv.a.
Cost of synchronous condensers: $4.50 per kv.a.
Cost of transformers: $2.00 per kv.a.
Cost of transmission line without conductors but including towers, insulators and right of way: $15,000 per mile.
Cost of conductors: $4,700 per mile.
Generator losses at full load: 3.7%.
Condenser loss at rated load: 3%.
Transformer loss at full load: 1.3%
The curves are for a delivered load at 85% power factor and for 50, 75 and 100% load factors.

To determine the cost of electric transmission a large number of items have to be considered, many of which depend upon local conditions. The curves in Figure 5 can only be accepted as a more or less typical case. Another approximation that is imposed on this investigation is the assumption that both the generating and substations are large and have a number of transmission circuits between them, thus making the cost per kv.a., of generating station practically independent of the amount of power transmitted over one circuit. The curves in Figure 5 are given for 50, 75 and 100% load factors and, since the lower load factors, 50 and 75, depend upon load curves, an explanation of how the losses for these curves were obtained is in order. The losses at various loads including zero load, were computed for four normal ratings, 50,000, 70,000, 100,000 and 130,000 kw, 85% power factor, and were plotted in Figure 6. For the 50% load factor, it was assumed that the load varied between zero and normal, each fractional load being delivered for equal increments of time. The lossess for these increments of time were then summed up and divided by the number of increments: thus the average loss was obtained, which was approximately 15% higher than that corresponding to one-half load. For the 75% load factor the load was also assumed to vary from zero to normal but the increments of time increased in value as the fractional loads increased. The loads corresponding to equals increments of time were then determined, the losses summed up, and the average obtained. The average loss for 75% load factor by this method was 8 to 14% higher than that corresponding to three-quarters load.

In a long high voltage transmission line the charging kv. a., may be an important element in the choice of generating units. It may even fix the minimum size of machine that will give stable operation. Since a machine of normal design will carry only 40 to 50% of its rated capacity at 0% power factor leading, it may be necessary where moderate sized units are used to operate two machines in parallel for each line to obtain stability at light loads. For the line investigated above, if the receiving end of the line is open 30,000 kv. a., at 90% voltage will be required to charge the line and maintain a normal voltage at the receiving end. This would require an abnormally large machine of 60,000 kv. a., or two machines of 30,000 kv. a., each of normal design on one line to maintain stability. This more or less extravagance in generating capacity on a lightly loaded line can be pre-

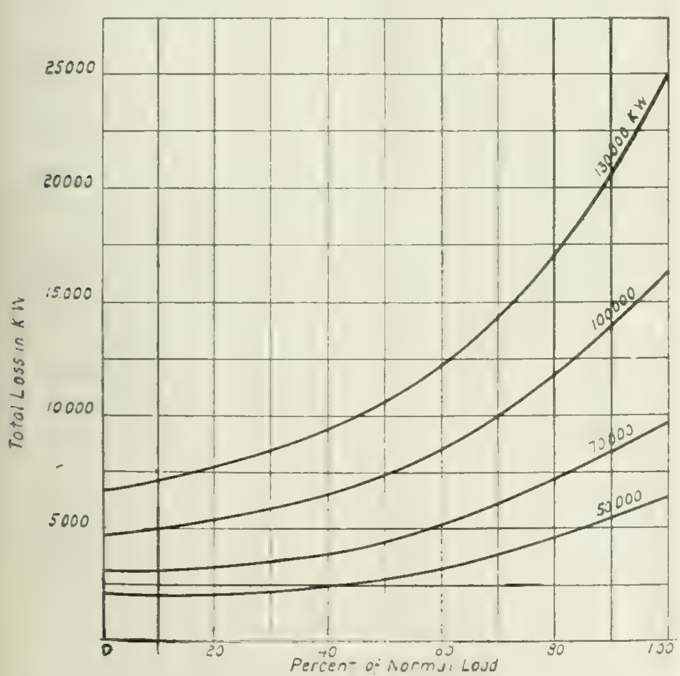

Figure 6

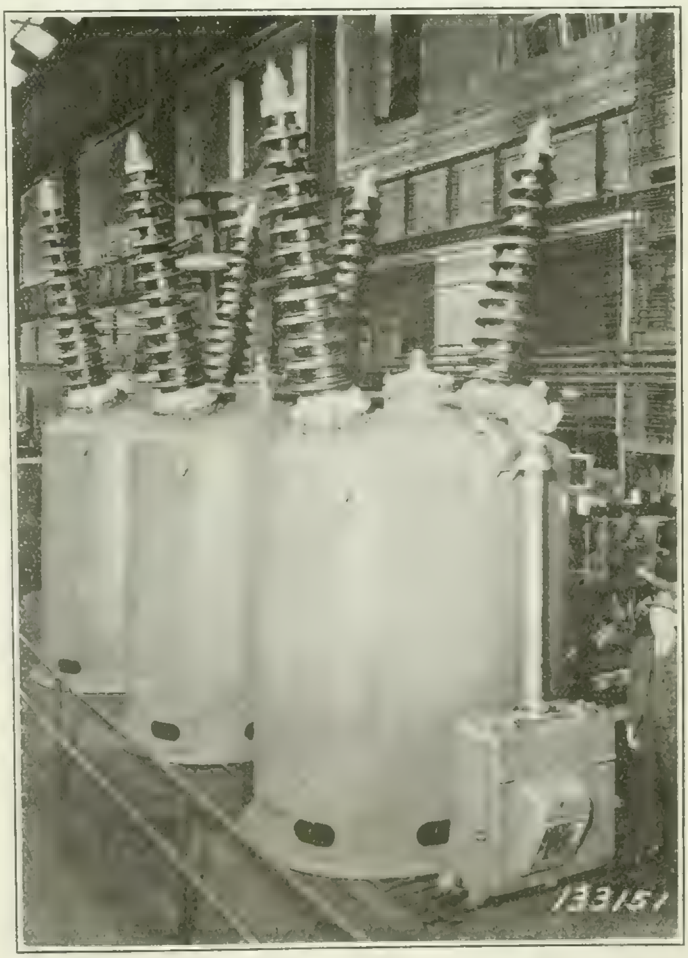

Figure 7. 220,000-Volt Circuit Breaker.

vented by using specially designed machines. A 30,000 to 35,000 kv. a., unit can be built that would handle this case and would have only a slight increase in cost over a normal design of possibly 10 or 15%. This special machine should have a wide range of excitation, while may fall even below the residual voltage of the exciter. To meet this condition a special broad range regulator should be used which can be of the combined vibrating and rheostatic motor-operated face plate types, the vibrating regulator taking care of the fine adjustments and the rheostatic regulator cutting resistance into the field circuit in such steps that the combined regulation will be continuous over the necessary range. By using a high speed motor-operated face plate this regulator fills the requirements.

In order to prevent voltage on the transmission line from rising above normal value, the generator voltage for the 200 mile line considered must be reduced to approximately 90% of normal in case the receiving end of the line becomes open. This can either be taken care of by hand or automatically. The automatic arrangement can be accomplished by a device that will lower the voltage when the charging kv. a., at no load exceeds a predetermined value.

As stated before a 220 kv., system should have a solidly grounded neutral. This will permit the usse of differential and ground current relays for the proper selection and isolation of a line in trouble without interruption of service.

A necessary and important device on a high voltage transmission system is the oil circuit breaker. The amount of energy concentrated on a 220 kv., system is bound to be large from the economics of the problem. The circuit breaker must therefore be of substantial construction and be capable of interrupting large amounts of power, possibly 750,000 to 1, 500,000 arc kv. a., for the larger systems. The Westinghouse Electric and Manufacturing Company have built six oil circuit breakers which will control the new 220 kv., lines from the Pit River development of the Pacific Gas and Electric Company. These breakers are in elliptically shaped tanks and have quick break arcing contacts. One of the breakers is shown in Figure 7. Recently the Westinghouse Electric and Manufacturing Company have received an order from the Southern California Edison Company for twenty-two oil circuit breakers which will go in cylindrical tanks and will also have quick break arcing contacts. These breakers are also for 220 kv., service and will be used for controlling their principal lines after the change over of the system from 150 kv., to 220 kv., has been made.

The chief abnormal voltage stress on a transmission system is between lines and ground. Whether these stresses on 220 kv., systems are serious or not and whether means for relieving them are advisable, such as the use of ground wires and arresters, have been given considerable discussion. Opinions on this subject differ. One aspect of the ground wire as applied to solidly grounded neutral systems so far has received little or no comments, that is, its stabilizing effect of the neutral along the line. In effect, the ground wire constitutes the fourth wire of a four-wire, three-phase system and as such should be tied to the station grounds at both ends of the line. The ground wire will then not only serve to hold each tower

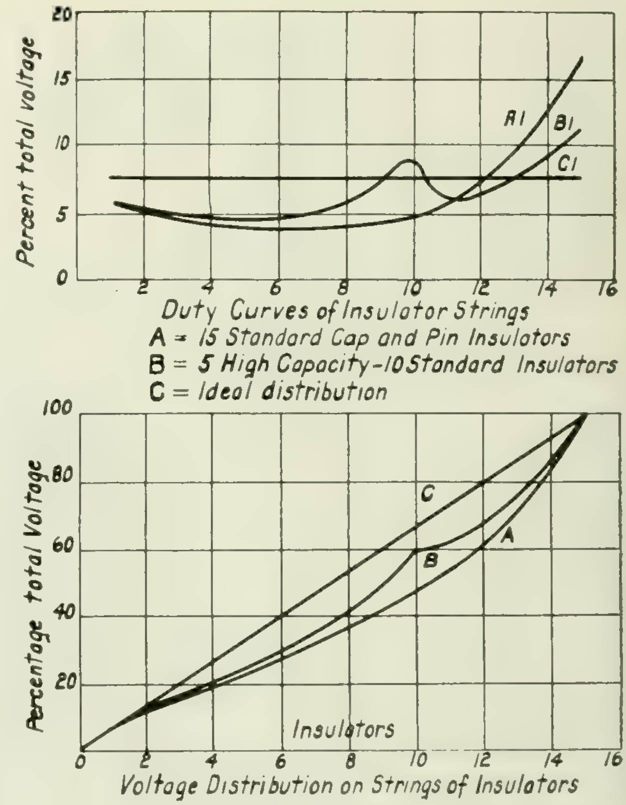

Figure 8

at ground potential, which otherwise may not be at ground potential in case of an insulator flashover due to poor ground connection of the tower, but will also give more definite relay action by reducing the ground resistance. The ground wire effectively reduces voltages caused by lightning 20 to 40%, depending upon its relative spacing to lines and ground. Such a reduction is appreciable when applied to voltages of the order of those required to flash over the insulation of 220 kv., lines and probably would bring induced voltages down to such values that the line insulators would withstand them for the short time that they exist. The overhead ground wire produces an additional load on the towers and may be a source of considerable trouble from breaks which may be out of all proportion to its benefits. It is interesting to note that for this reason ground wires were not recommended for 220 kv., in the super-power survey. Neither were lightning arresters recommended. It would seem that much of the objection to ground wires could be overcome by stringing them below the power lines without materially destroying their electrical advantages. The two 220 kv., transmission systems, now being built in California, will be provided with ground wires but no lightning arresters will be used so far as is known at present. In regard to the advisability of installing lightning arresters on 220 kv., lines only future experience will dictate. The most serious drawback at present seems to be their high cost.

Since reliability will be of great importance for the large amounts of power involved in 220 kv., systems,

the switching arrangements at both substations and power stations may be quite elaborate. An extensive use of disconnecting switches in the layout may lead to a material reduction in the number of oil circuit breakers required, especially with a double bus layout. Two general types of disconnects have been proposed for 220 kv., service. One consisting of a three pillar type where the central pillar rotates or carries a blade which engages both stationary pillars and thus gives a double break. The other consists of two stationary pillars carrying a knife switch opened by a toggle arrangement which is controlled by the rotation of a third pillar, thus giving a single break. These switches can be operated in gangs of three and permit of quite flexible arrangements in the station layout.

The high voltage equipment for 220 kv., requires considerable space both on account of its size and the large insulating distances required and for this reason should be installed out of doors.

The importance of the line insulators cannot be over emphasized, since the question of reliability and continuity of service hinges on them. Since the cost of insulators is a very small fraction of the total cost of the installation, it would appear worth while to increase the investment on line insulation, provided that greater reliability is obtained thereby. The line insulation must consist, at the present state of the art, of porcelain insulators in series. When insulators are placed in series in a string the voltage does not distribute uniformly over them. The insulator units near the line take more than their share of the voltage. In Figure 8 are given typical curves showing voltage distribution and voltage duty respectively of two strings of fifteen insulators each for dry conditions. In this figure, curve A is for fifteen standard cap and pin insulators with standard arcing horns. Curve B is for a mixed string consisting of five high internal capacity units next to the line and ten standard cap and pin units. Curve C is what would be obtained with ideal distribution of voltage. The last or fifteenth insulator for the uniform string takes 17% of the voltage: using five high capacity units next to the line reduces the voltage on the fifteenth insulator to 11-½% of full voltage. An ideal string would have 6-2/3% on the line unit. In the past a great deal of stress has been laid on good distribution over the string and little attention has been given to the fact that there are many conditions of operations on a string of insulators in which outside conditions are the largest factors in determining voltage distribution. Thus, the presence of alkali dust on the surface of the insulator does not affect the distribution to any great extend when dry, but under rain the dust becomes conducting and the form of the distribution not only changes but some units in the string may be completely bridged electrically and throw considerably higher voltage on the remaining units. Even under dry conditions the advantages due to grading of units are questionable. Although it decreases the stress on the line unit, it causes corona formation where the charges in insulators occur and at times makes the arc of the flashover cascade along the string. A more satisfactory way of relieving the end insulators of their high voltages is the use of guard rings. They not only improve the voltage distribution but help to keep arcs away from the insulator.

The Iron Ore Mines of Bell Island, Newfoundland

Historical Sketch, Description of Equipment and Details of Operation.

Sydney C. Mifflen, B. Sc., A.M.E.I.C.

Paper read before the Cape Breton Branch, The Engineering Institute of Canada, March 9th, 1922.

Bell island must of necessity be of more than ordinary interest to the Cape Breton, and especially, the Sydney, engineer because of the fact that the manufacture of its product, iron ore, is carried on at the steel plants of The Sydneys and New Glasgow. This description will deal more particularly with the operations of the Dominion Iron and Steel Company on Bell island than with those of the Nova Scotia Steel and Coal Company, because the writer, during his residence there, was employed by the former company and is consequently more familiar with their methods and equipment.

Reference to a map of Newfoundland will show Bell island to be situated more or less centrally on the south side of Conception bay, about two and one-half miles from the main-land. It is distant from St. Johns, the capital of Newfoundland, a two-hour journey by car and ferry, and from Sydney some three hundred and eighty miles by sea. As is well known, its feature of interest lies in the mining of the deposit of iron ore occurring on it and in its neighborhood.

The island is some six miles long by two and one half miles wide. On it are five small towns connected by some twenty miles of fairly good roads and having a combined population of six thousand, not including some twelve hundred transient labourers who come from various parts of the country for a longer or shorter period of work at the mines. Two-thirds of its residents are directly dependent on the mines as a means of gaining a livelihood while the remainder, engaged in business, farming, fishing, etc., are indirectly so. Its public buildings, churches, halls, schools, etc., are such that any mining community might be justly proud to have.

Physiographically, the island is an undulating plateau rising sheer out of the sea to a mean elevation of some 220 feet. Indeed, so steep are its sides, about 10° to 15° from the vertical, that before the coming of the mining companies a landing could be made at only two points; Lance cove and The Beach. An inclined tramway now operates at the latter place for the convenience of travellers and the handling of freight.

History

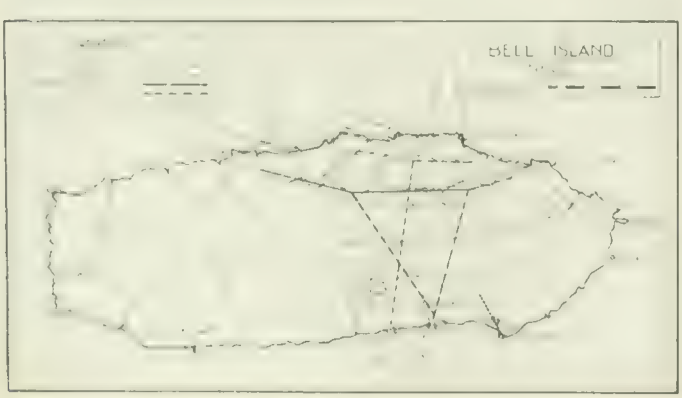
The earliest known mention of the ore fields of Bell island was made in 1842 by an English geological surveyor named Jukes. It was, however, wrongly designated by him as being bands of bright red "sandstone"; one of which, he noted, was eight feet thick.

Just who was the first to classify the deposit as iron ore is not definitely known. The fishermen of the island had been in the habit of using it for ballasting their boats and making primitive anchors by enclosing blocks of it in wooden frames. Its use as such was due to its comparatively great weight and compactibility. Tradition has it that it was from ballast being discharged at St. Johns that it first was recognized as iron ore.

In the Summer of 1893, R. E. Chambers, M.E.I.C., then mining engineer of the New Glasgow Iron Coal and Railway Company, but, today, truly, of Bell island fame, made an examination of the property and, acting on his report, the Hon. B. F. Pearson of Halifax and others secured an option on it. This option changed hands several times within the ensuing year, eventually being taken up by the New Glasgow Iron Coal and Railway Company, already mentioned. Mr. Chambers then made a second visit to the island, this time accompanied by Messrs. Graham Fraser, the principal, and Thos. Cantley, an official, of his company. After a more or less thorough examination of the deposits they, on behalf of their company, acquired the property. In 1895 this company underwent reorganization, emerging as the Nova Scotia Steel Company, (later as the Nova Scotia Steel and Coal Company), and in the same year development work was commenced on the island under the capable management of Mr. Chambers.

On Christmas Day of that year, the first cargo of ore, some 2,600 tons, was shipped from Wabana. Since that date an aggregate of over 19,000,000 tons has been mined and shipped, of which 13,000,000 tons have come to Cape Breton, the remainder being sold in European and United States markets.

Coincident with the acquisition of the property by the Nova Scotia Steel Company, the Dominion Coal Company through its president, H. M. Whitney, became keenly interested and obtained from the "Scotia" company an option on part of the property. At this period of its history the Coal Company met with some difficulties and the option was allowed to lapse. The interest felt by Mr. Whitney survived, however, with the result that in 1899 he formed the Dominion Iron and Steel Company and purchased a considerable area from Scotia.



As is well known, within the past year both the Dominion and Scotia companies have, with others, been merged to form the British Empire Steel Corporation, which now controls Bell island and the steel industry of eastern Canada.

Such is a short history of the ore deposits of Bell island and of the companies which brought it to its present stage of development; with what great results, beneficial to Newfoundland and Nova Scotia alike, it would indeed be hard to estimate.

Extent and Ownership

Five distinct seams of ore outcrop on the island. Of these, the three uppermost only are known to be of workable thickness in the area already proven. They are known as the "Upper", the "Scotia" and the "Dominion" or "Lower" beds; the locations of their outcrops being shown on the accompanying map.

The property is held in Fee Simple from the Crown, the title being vested in the constituent companies of the British Empire Steel Corporation. The land areas comprise some three and one-half square miles and the submarine areas eighty-five square miles.

Under the sale of 1899, the Dominion Iron and Steel Company became owners of the "Dominion" bed on Bell island and part of the "Upper", the Scotia company retaining the entire land area of the "Scotia" bed and the remainder of the "Upper". A submarine block adjacent to the north side of the island, extending some three miles east and west from Gull island to Ochre cove by a mile in depth, also became part of the holdings of the Dominion Iron and Steel Company. Seawards from this, the Nova Scotia Steel and Coal Company, held an area of slightly over eighty square miles; their northern boundary being a small block of one square mile owned by the Dominion Iron and Steel Company. Different from the land holdings, where each company owned individual seams, (or parts thereof), in the same area, in those which are submarine each company owns all seams within its boundaries.

As to the extent of the ore fields, and the amount of ore present, it is almost impossible to predict. Calculations based on geological and structural inferences tend to indicate that the total tonnage present will run over the billion mark. What part of this will be economically available will depend on conditions and circumstances impossible to foretell.

Geology

More or less exhaustive studies by several geologists of note have shown that the ore beds are of primary sedimentary origin, deposited on the bed of a marine sea throughout the upper one thousand feet of a series of sandstones and shales laid down in the Ordovician Period. The beds dip in a general northerly direction at from 8° to 10°.

A vertical section compiled from a diamond drill boring near the intersection of the Scotia tramway

and Dominion bed outcrop, shows the general stratigraphy of the fields. The upper bed is the highest and has a workable thickness of from five to eight feet. About fifty-five feet below it, is the Scotia bed; the intervening strata being sandstone with shale partings with pebble bands of hematite adjacent to each main bed. This bed shows a disconformity inasmuch as it is distinctly cross-bedded. Its thickness varies from seven to nine feet. Small local concentrations of galena occur which are regarded as a peculiarity, as is also the upper six inches of the bed, which, different from the prevailing "red" of the other ore, is of a distinct greyish texture, the colour being sharply defined.

Passing down the section through sandstone, with shale partings, and a heavy deposit of shale, the Dominion bed is met some two hundred and forty feet below the Scotia. The thickness of this seam runs from eight to twenty feet in general but in submarine workings a thickness of thirty-three feet has been met. Just overlying this bed are three bands of oolitic iron pyrites ranging in thickness from an inch to over a foot.

Below the Dominion bed is a series of sandstone and shale with numerous ferruginous partings—the two other seams mentioned being some three hundred feet and seven hundred feet respectively below the Dominion. Throughout the whole, fossils and fauna are numerous and rippel marks can easily be seen.

The surface of a fresh fracture of the ore presents a reddish grey colour which weathers to a reddish brown. There are two principal iron bearing minerals; oolitic hematite and chamosite. The former carries iron as a ferric oxide and the latter is an aluminous ferrous silicate. A third mineral, siderite, a ferrous carbonate, is also locally of importance as the iron bearing constituent of the ore but it is not persistent throughout the beds.

Microscopically, it is seen that the ore is composed of small spherical concretions, varying in diameter from one-tenth to one-half a millimetre. These are formed of concentric layers of hematite and chamosite around a nucleus which is occasionally a piece of shell or a grain of mineral, the interstices being filled very often by siderite in a crystalline form.

To anyone interested in a detailed study of the geology of this deposit, the writer would recommend Dr. A. O. Hayes'work entitled, "Wabana Iron Ore of Newfoundland". He wishes, also, to acknowledge his indebtedness to this work for much of the information in the foregoing.

Analysis

The Wabana ore beds are of a higher grade in iron than most other sedimentary ores of like origin. The following actual analysis can be taken as typical:—

Iron	52.35%
Silica	13.20%
Sulphur	0.04%
Phosphorous	0.85%
Alumina	4.20%
Lime	2.80%
Magnesia	0.68%
Manganese	0.43%
Moisture	1.75%

General Surface Layout

Reference to the accompanying map will show the general layout of the island. The Dominion bed outcrops for a distance of three and one half miles, from Gull island to Ochre cove. At more or less regular intervals along it are located Nos. 1, 2, 3, 4, and 5. of the Dominion mines. No. 1 is now worked out. It was entirely on land in the eastermost "wing" or "overhang" of the bed, before it became submarine. No. 2 has been the great producer and is developed to a greater extent than any of the others. It is now submarine, the total length of the main slope being about 5,400 feet. No. 3 is located more or less centrally. West of it is No. 4, which is of comparatively recent development but which is today producing a very high grade of ore. Its main deeps have not yet entered submarine areas. Located similarly to No. 1, but in the western "wing" of the seam, is No. 5. This slope has not been working of recent years and comparatively little ore has been mined therefrom. In the Scotia seam are two mines; Scotia No. 1, which is now finished, and Dominion No. 6, which was formerly Scotia No. 2.

As before mentioned, each company owned individual seams on land, but all seams in submarine areas. To tap their submarine areas, the Scotia company had first to pass through those of the Dominion company. An agreement was made between the two companies to this effect; the Scotia company undertaking to drive a new slope underneath the Dominion bed, and upon completion of this to transfer their portion of No. 2 slope on the land areas to the Dominion company. Through this arrangement Scotia could still produce while driving the new slope, (mostly through rock), and the Dominion company would gain its submarine areas in Scotia bed without cost of driving a slope.

Scotia No. 2 was therefore continued, entering the Dominion submarine areas in 1906. Work on the proposed tunnels under Dominion bed was commenced in 1913, two parallel slopes being driven through rock, and finished four years later. This is now the Scotia No. 3 slope, or as it is locally known, Scotia submarine. It was driven both ways; i.e., backwards from the submarine workings and also from the surface. The total length is 2¼ miles and the meeting was of remarkable accuracy; the divergence of centre lines being only 1¼ inches. The average section is 8 feet x 13 feet 6 inches. For a certain distance the dip of the slope was increased to 30° so as to cut the Dominion bed from which Scotia is now mining.

Running roughly parallel to the Dominion outcrop is a tramway by which the ore is collected from the mines to two yards; known locally as the east and west "bottoms". From these points, converging main line tramways run to the Dominion pier, thus forming a triangle. A similar layout of tramways was operated by the Scotia company; a collecting track parallelling their outcrop but only one main line running from a central yard to their pier. All tramway is double tracked, two foot gauge and is operated by endless haulage cable.

At various points near the mines were located machine electric and car repair shops, forges, smaller steam plants and compressors. The Scotia main power plant is situated

at their pier. The east power plant of the Dominion company is at the eastern corner of the triangle of track. Their central station; the new plant to which reference will be made later; is at their pier. The piers of both companies are located on the south side of the island.

Methods of Mining

In the early days of mining on Bell island, the outcrops of the various seams were stripped of the overlying soil and the ore then shot and loaded into cars by hand or steam shovel. Very little of this surface mining is now done, although there is still in reserve some two million tons which can be taken out in this manner but, of course, the stripping will be heavier as the seam makes cover.

The method of mining today is a modified form of the room and pillar system. Slopes are driven through the seams following the direction of full dip and from these slopes levels, alternating on either side, are driven at intervals of fifty feet on land and one hundred feet in submarine workings. Following the usual practice, these levels are inclined uphill to the slopes so as to give a grade of 1 to 1½ per cent in favour of the loaded cars coming out of the levels. Crosscuts and headways, driven parallel to the main slopes divide the area into rooms and pillars. Under this system it is estimated that in land workings 55 per cent, and in submarine 60 per cent, of the ore is taken out, before any attempt is made to "draw" the pillars.

All the mines are entirely free from gas of any kind. No mechanical ventilating plant has yet been required to supply air to the Dominion mines. The static head is controlled by means of stoppings, etc., so that the natural draft through the slope and an air shaft is all that is necessary, but a point will soon be reached where the force required to overcome the rubbing friction will be greater than the static force and mechanical power will be necessary. The Scotia submarine has a ventilation plant consisting of one four-foot and two three-foot Sturtevant fans, motor driven. Fresh air is led to the working faces in ducts and allowed to return through the main slope. The mines are also remarkably free from water, the usual practice being to collect the water in sumps during the day and to pump for three or four hours during the night. The entire pumping plant including relays, of Dominion No. 2, the largest mine, has a capacity in the neighborhood of 800 g.p.m. In Scotia submarine, the pumps work continuously but even this mine does not make a great quantity of water.

The ore has a very distinct cleavage from the rock and throughout all the mines the hanging wall is of such good character that very rarely indeed is any timbering or support of any kind needed. It is always shot from the solid, and breaks up readily into small briquettes, the lines of cleavage being parallel to the plane of embedment and the principal fault systems. It has been found that one pound of dynamite displaces two or three tons of ore. All drilling is done by day. The holes are loaded immediately the men leave the mines and the shooting is usually finished before midnight.

As to the equipment of the mines, it has been thought best to describe that of one mine as being typical of the whole and for this purpose Dominion No. 2 has been chosen. The main slope is double tracked with sixty-pound rail of two-foot gauge, lighter rails being used in the levels. The drills used are air driven Sullivan hammer drills taking 1¾-inch cross bits. All cars, both surface and underground, are steel and of standard size, the box being five feet by three feet, by two feet, which will hold 1.7 ton of ore. The ore is loaded into the cars by hand or mechanical shovels. A pair of men fill from thirty to forty cars per ten hour day, though a record of sixty-two has been made. The mechanical loaders in No. 2 are two Myers Whaley motor driven shovels. These each load upwards of one hundred and fifty cars daily.

This shovel is different from the ordinary type inasmuch as the bucket or dipper is mounted on a revolving crank instead of a boom. Very little headroom, (about 4 feet 6 inches), is required. It is operated by one man, the idea involved being: The entire machine moves ahead and plunges the dipper into the ore and as it is filled, backs out. The revolving crank brings the bucket to an upright position and throws its charge into a small hopper, from which it feeds to a conveyor belt and falls from this to the waiting cars. The operator has control of each separate movement but, when the shovel is working, all take place concurrently. Power is supplied through cone friction clutches and chain drives from a 20-h.p., d.c., motor.

The cars, as they are loaded, are taken from the working places by horses or small electrically operated 30-h.p., d.c., hoists to head and tail rope level haulages by which they are assembled at the landings. They are here coupled in seven- to ten-car trips and hoisted up the main slope to the deckhead.

The main hoist is a Vulcan, 7-foot diameter drum, driven by a General Electric a.c., variable speed, slip ring type, 3-phase, 500-h.p., motor, taking 485 amps., at 550 volts, and operating up to 442 r.p.m., with full load. It is operated from a master controller through contactor panels. The hoist is fitted with both hand and air operated brakes and with gears in the ratio of 31 to 242, and gives a cable speed of 1,250 feet per minute.

At the deckhead the cable is disconnected from the loaded trip and connected to a waiting trip of "empties", which immediately start down the mine. The loaded cars are then passed singly through end-dump tipples, over a spring switch to a kick-back and thence to the empty track. From the tipple the ore may pass over a belt from which a great part of the rock is picked out or it may go directly to a No. 8 gates crusher, driven by a 90-h.p., General Electric motor. It is fed from the crusher to an inclined belt, 36 inches wide at about 35°, from where the remainder of the rock is picked out. This belt is driven by a Northern Electric d.c., motor of 35 h.p., geared to the head rollers to give it a velocity of about 80 feet per minute. The picking belt discharges the ore into a hopper large enough to take one hundred tons more or less, and from here it is loaded through chutes into the cars to be shipped to the pier directly in summer, or into a side dump seven-ton car to be hoisted to the stock pile in the Winter season. The stock hoist is a Flory, operated by a 230-h.p., Harland d.c., motor. During the shipping season a No. 60 Marion steam shovel operates at the stock pile to load the ore into cars for transportation to the pier.

On the tramways the cars are gripped singly to the haulage cable. Arriving at the pier, they pass through tipples similar to those in the deckheads and discharge, reaching the return track by a run around or through kick-backs as they may be routed. These tipples are located around the edges of a storage pocket but from two of them the ore may be led to an inclined belt placed to discharge from a height over the centre of the pocket so as to distribute the ore evenly. There is also a crusher at the pier through which may be diverted all ore from surface workings.

The storage pocket is an excavation in the rock at the top of the cliff. Its capacity is 23,000 tons, though it has been extended on the north end to give a total capacity approaching 40,000 tons. This latter half is not yet in use. Underneath this pocket is a tunnel, and at intervals, are chutes from the bins so that the ore may be loaded to a horizontal bucket conveyor running through the tunnel and over a trestle to a tower at the pier head, dumping via an open chute directly to the hold of a steamer. This conveyor travels at about 100 feet per minute and can handle over 2000 tons per hour. In fact, 7,000 ton boats have been loaded in three hours; the average time being about three hours and twenty minutes, including time required to shift hatches. On the east and west sides of the tower are derrick booms to facilitate the discharging of freight.

Access can be had to the pier only by an inclined two-car, balanced, skipway with a grade of 43 per cent and over this all incoming freight must be hoisted.

As for Scotia, they mine in practically the same manner but collect the ore at a central pocket in the mine and hoist it to the surface in single twenty-ton cars. The system is balanced, an empty car going down while the load is coming up. They hoist through a distance of slightly over two miles in four minutes and a trip in one of those cars is quite an experience. "Rakes", or passenger cars run at morning and night to take the miners to and from work. They have no tipple in the deckhead, the cars being of the bottom dump type. Three different types of mechanical loaders are used, the Myers Whaley as described above, the Thew, and the Armstrong. The operations on the surface, the system of transportation to the pier and the handling at the pier, are similar to those of the Dominion company.

Dominion Power Plants

Within the past year an up-to-date central power plant has been put in operation. Previously the eastern power plant, referred to above, was the main station and in fact the only one generating electric power. There were also several smaller boiler plants located at or near the mines as required, but today electricity has replaced steam entirely and also air to a large extent and these latter have been dismantled.

In the eastern plant there are eight class A, Stirling boilers rated at 260 h.p., each. The main generating engines were a Bellis and Morcam 16½"x23"x33", and a Robb 17"x25"x14", driving directly connected Westinghouse d.c., generators of capacity 500 kw., and 300 kw., respectively. Current was generated initially at 550 volts but there was three wire connection to give 275 volts.

The main compressor plant was also in this station. It consisted of two Walker, cross compound, two-stage, compressors, each with a capacity of 3,500 cubic feet of free air per minute. The steam cylinders are 22 inches and 42 inches; air, 23½ inches and 38½ inches; stroke 48 inches compressing to 80 lbs. per sq. in. At various locations on the island are other compressors, viz., two Norwalks, three Rands and a Nordberg with a total capacity of 8,000 cubic feet per minute. All engines in the east plant were run condensing.

Situated on top of the cliff at the pier is another power plant with three similar Stirling boilers operating a small compressor, a 130-kw., d.c., generator, the skipway hoist, and the main haulage engine. This latter is a Robb engine, tandem compound, Corliss valve, 20"x28"x36", of 250 h.p., engaging through friction clutches to grooved drums around which the cables pass.

Central Power Station

As development work in the mines increased and a greater output was called for, it was seen that an increase in power was also necessary. Further, the advisability of having one central generating station was recognized. Fuel was an expensive item due to the long sea voyage from Sydney and hoisting to the surface and distributing it over the tramways to the various boiler plants made in considerably more so. At the same time, the pier, which had served for both loading and discharging ships, was rapidly approaching a state of more or less continual congestion and it was realized that an extension to it would have to be made.

These and other considerations led to the decision to construct a turbo-electric power station at tidewater and to build around it a pier sufficiently large to store a season's supply of coal which would be discharged directly upon it. Designs were accordingly prepared by the Sydney office under the direction of G. D. Macdougall, M.E.I.C., followed by K. H. Marsh, M.E.I.C., the writer being the field engineer on erection. The type of building decided upon was concrete foundations, steel frame, roof trusses and floor beams, brick curtain walls

New Central Power Station, and New Pier nearing completion.

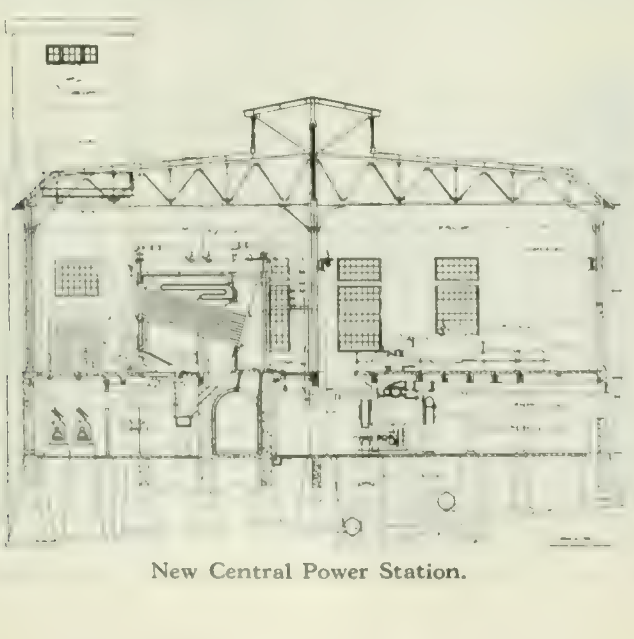
carried on basement wall of concrete, reinforced concrete floors, and wooden roof with tar and gravel waterproofing.

Soundings taken to the east of and adjacent to, the existing pier showed that a mean depth of thirty-two feet of water was available about two hundred and thirty feet from the shore line. Here a breast work was built in 1917, enclosing an area of some four hundred feet frontage by two hundred and thirty feet in depth. This was filled with rock brought from the mines and blasted from the overhanging cliffs.

The location chosen for the power plant was immediately at the cliff side, roughly on the north and south centre lines of the enclosure. The dimensions of the plant on centre lines of columns were 82 feet east and west by 101 feet 11 inches north and south. It was found that eighteen feet of water at the south-east corner was the extreme depth to be contended with in placing the foundations, and that barely twelve inches of silt and mud covered good bed rock.

A cofferdam of two 2-inch plank walls spaced twenty-four inches apart was constructed around the site, some ten feet being left as clearance between the dam and the foundations. Very little dependence against pressure could be put in the penetration of plank as it was so slight but a system of "figure 4" and rectangular bracing was employed, the latter to act as stiffeners from side to side, and front to cliff. The space between the plank walls was filled with a pug and a dump of the same made on the outside of the wall so that the top width of the dam was about eight feet sloping naturally to a varying width depending on depth of water. The pumping plant consisted of two centrifugals of 2,000 g.p.m., and 400 g.p.m., capacity, respectively, and four Camerons with a combined throw approaching 1,000 g.p.m.

All columns were supported by battered piers of average top dimensions, 2 feet 6 inches by 3 feet 6 inches. These latter were connected by arched curtain walls of mass concrete, 25 inches in thickness by usually 60 inches in depth. The whole was poured monolithically. Foundations for boilers and generators were of the same general type. All foundations were brought to elevation 10.75 above low water.



New Central Power Station.

The stack was located some forty feet to the east of the building, and connected thereto by an arched reinforced concrete breeching. At this point a considerable depth of clay with boulders was found on the bed rock. Creosoted hard pine piles were driven at two-foot centres and over these a heavy mat of concrete, some 40 feet square, was laid to take the actual stack foundation. This latter was 24 feet 6 inches square at the base, tapering to an octagonal section of 20 feet diameter at elevation 29.25. The stack is steel, self supporting. and was erected by the Maritime Bridge Company under separate contract. It is 9 feet in diameter and 187 feet in height., i.e,. about 216 above mean low water, or some 20 feet above the top of the cliff at this particular point.

The steel columns,which ranged from single 10 inch H's to built-up latticed columns of 12 inches by 30 inches outside section of H's and channels, weighing up to four tons, were all erected by means of timber A-frames and tripods. The placing of the roof trusses, girders and beams occasioned no difficulty as they were not of great weight. After the main steel work was in position, the basement wall, of 21 inches of concrete, was poured to elevation 25.75 and brickwork proceeded with. The floors, boiler flue, column casings, etc., were poured later as the interior steel and forms were erected. All steel is encased in concrete. To the west of the building, foundations were placed for an additional battery of boilers and for an L extension to the building, to provide for future installment. The total yardage of concrete in the entire structure was about 3,300.

The concreting plant consisted of a half yard Ransome, motor driven, mixer. The materials were hoisted up an incline to a platform, there proportioned and fed through a chute to the mixer. Wheelbarrows were used to distribute the concrete. A fair percentage of good clean "plums" was added after the concrete had been poured into the forms. Care was taken, by "spading", to see that these were well embedded and kept from the surfaces. Concreting and form-building went on concurrently once the latter was far enough advanced. Rough one-inch boards, and two by fours were used in form work and, where necessary, heavier stock was used for bracing.

A central wall east and west divides the building into two halves, the turbine and the boiler rooms. The general arrangement of machinery can be seen from the accompanying section.

Boiler Plant

There are two batteries of Babcock and Wilcox boilers, of 4,780 square feet of heating surface per boiler. Steam is generated at 175 lbs., gauge pressure with 150°F. of superheat.

Fuel is fed by Taylor stokers with extension grates and power operated dumping mechanism. The stokers are operated by Troy reciprocating, 5"x7" engines. Forced draft is supplied by two Buffalo fans located in the basement. These are capable of delivering 30,000. cu. ft of free air per minute at 5½ inches static pressure and are operated by direct connected single stage Terry turbines of 58 h.p.,

at 175 lbs., working pressure and 1,840 r.p.m. The Stoker engines and fans are interconnected by automatic control regulators so that their rates of operation are mutually dependent and in accord with the demand for steam.

Specifications of the boiler plant call for the following efficiencies:—Combined boiler and furnace, not less than 75%; furnace, not less than 98%; and a gas analysis shall show not less than 13½% carbon dioxide nor more than 0.1% carbon monoxide.

The boiler feed pumps are two Fairbanks Morse reciprocating, 12″x7″x12″, and are so piped that if necessary they can be used as fire pumps. Feed water is heated to 210°F. in a Cochrane V-notch recording heater of a maximum capacity of 100,000 lbs., per hour.

Generating Plant

The generating units are two direct connected turbo-generators, supplied by the General Electric Company. Dealing with one unit, the prime mover is a three-stage Curtis steam turbine, 160 lbs., steam pressure at the throttle, speed 3,600 r.p.m., exhausting to Wheeler surface condenser of 2,200 sq. ft., condensing surface, designed to maintain 1½-inch absolute vacuum. Sea water, led in ducts from the pier side to a sump, is used as cooling water and is circulated by a 10-inch centrifugal pump of 2,330 g.p.m., capacity against an 18-foot head, at a speed of about 830 r.p.m. This pump is operated, through flexible couplings and Poole turbo reducing gears, by a Curtis steam turbine, single-stage, non-condensing, taking steam at 160 lbs., pressure, speed 3,600 r.p.m., rating at 25 h.p. The condensate is delivered to the feed water heater by a 2-inch centrifugal pump direct connected to a Terry steam turbine, 130 lbs., pressure, 2,500 r.p.m., 5 h.p. A 16-inch Multiplex Patent atmospheric exhaust relief valve is installed as a protection in case of loss of vacuum. Hand operated by-passing valves are also installed so that the turbine can be run non-condensing in emergency.

The alternators are of the three-phase, 60-cycle type, designed to generate 1,250 kw., at 2,300 volts, power factor 0.8, 3,600 r.p.m. Field excitation is provided by a 13-kw., 125-volt, d.c., generator mounted on an extension of the main shaft.

Bus bars from the generators lead underneath the floor and up, through oil switches, to the main busses which are supported by, and above, the switchboard frame work. This latter, with extensions, also carries the distributing busses.

The switchboard consists of two generator and exciter panels, arranged for parallel operation of generators; one transformer panel; one station service panel; one instrument panel; and two outgoing feeder panels. Current is transmitted over the lines at 6,600 volts from three step-up transformers each of 833 kv.a., normal capacity. The lightning arresters are of the aluminum cell, electrolytic type for indoor use on the 6,600-volt circuit. The turbine room is equipped with an overhead, hand operated, travelling crane of 20 tons capacity.

The transmission lines lead from the wall bushings to an insulator arm projecting from the cliff side and thence straight up to a steel tower on the top. From here pole lines follow the tramways to the east and west substations.

Operating outside the power station, over the area provided for the stocking of coal, is a Brown Hoisting and Machinery Company locomotive crane with a grab of 54 cu. ft., capacity from a 50-foot boom. This crane feeds the coal to a hopper, whence it passes through crushing rolls and, via a bucket elevator, to a 60-ton storage bin, descending to the stokers through 12-inch chutes.

Substations

The east substation is situated near No. 2 mine. It houses two banks of transformers, a motor-generator set and the Vulcan main hoist referred to above, together with the necessary operating equipment. The voltage is stepped down through 250-kv.a., transformers to 550 volts for connection to the Vulcan and through 500-kv.a., transformers to 2,200 volts to operate the motor-generator set.

The motor-generator set consists of a synchronous motor rated at 1,100 kv.a., at 2,200 volts with a 700 h.p., output, 0.5 power factor, 900 r.p.m., and a d.c., generator of capacity of 870 amps., at 575 volts, both General Electric machines.

At No. 4 mine are two substations. One consists of a bank of transformers stepping-down to 550 volts to operate a Vulcan hoist motor similar to that at No. 2. In the second the voltage is transformed to 220 volts for crusher and belt motors and to 2,200 to connect to a motor driven Canadian Ingersoll Rand air compressor. This compressor is two-stage, the cylinders being 20¼ inches and 32 inches diameter, stroke 24 inches, and compresses 3,200 cu. ft., of free air per minute to 80 lbs. per sq. in. The motor is synchronous, rated at 477 kv.a., power factor 1.0, speed 164 r.p.m.; or the equivalent of 596 h.p., output.

The thanks of the writer are due to H. B. Gillis, superintendent mines and quarries, British Empire Steel Corporation for permission to write this paper and also for his kindness in reviewing it.

Professional Meetings 1922

Vancouver: June sixteenth and seventeenth.
Winnipeg: September fifth, sixth and seventh.

British Columbia Professional Meeting.

Further details are now available as to the programme of the B. C. Professional Meeting, which is to be held in Vancouver on Friday and Saturday June sixteenth and seventeenth and while the programme as given below is only provisional, it is expected that the final programme will differ only in additions to the present plans. Both the Victoria and Vancouver Branches are co-operating to make this first Professional Meeting on the Pacific Coast, one of particular interest and enjoyment to all those who are fortunate enough to be present.

Provisional Programme.

Friday, June 16th.

9.00 A.M. — Registration.
9.30 " — Address of Welcome.
10.00 " — Town Planning.
11.00 " — Irrigation.
12.30 P.M. — Luncheon at Hotel Vancouver.
2.30 " — Inspection Visit to Ballantyne Pier.
3.30 " — Engineering in B.C., Logging Industry.

Saturday, June 17th.

9.00 A.M. — Business Meeting.
Welfare
Policy
British Columbia Provincial Division
2.00 P.M. — Sightseeing Trip to Peace Arch.

Engineering Legislation In Ontario

The Ontario Professional Engineering Bill came before the House again on May 10th, and was discussed at some length. The majority of the members seemed to be in favour of it, but a few raised considerable objection to Clause 34. This, as presented to the House, read as follows:—

"34. Any person in the Province of Ontario who, not being registered as a member of the Association in the Province of Ontario, or licensed by the Association;

(a) Practises as a professional engineer;
(b) Usurps the function of a professional engineer
(c) Uses verbally or otherwise the title of professional engineer, or makes use of any addition to or abbreviation of such title, or of any words, name or designation that will lead to the belief that he is a professional engineer or a member of the association, or that he is a person specially qualified to practise in any branch of professional engineering;
(d) Advertises himself as a professional engineer in any way or by any means.
(e) Acts in such manner as to lead to the belief that he is authorized to fill the office of or to act as a professional engineer;

shall be liable upon summary conviction by any court of competent jurisdiction to a fine of not less than $100 nor more than $200 for the first offence, and to a fine not less than $200 nor more than $500 for any subsequent offence.

After various suggestions as to possible re-wording, the Bill was finally referred back to the Special Committee of the House which had previously considered it. This committee recently met, together with a delegation from the Advisory Conference committee and the Executive of the Toronto Branch, and after prolonged discussion it was arranged to report back the Bill with Clauses a and b deleted. It is generally thought that in the amended form it will be acceptable to the Legislature.

Professional engineers will feel disappointed that the House could not see its way clear to passing the Bill in its original form, but even as amended it will be a marked achievement. This applies not only to Ontario but to Canada as a whole, because the other Provincial Acts cannot

be of full value until the legislative chain be complete, and Ontario forms another link to that end.

Recent Honours and Degrees

The Institute extends its heartiest congratulation to the following members who have recently completed their courses at Queen's and McGill Universities and have qualified for the various degrees in Applied Science. The list of these members is long and is headed by the names of those receiving Honours followed in turn by the M.Sc., and B.Sc. With assurance that the peak of the present period of industrial depression is passed *The Institute* is prepared to render assistance to its younger members in every manner possible.

W. Greenwood, B.Sc., New Liskeard, Ont.
C. E. Malone, B.Sc., Regina, Sask.
D. R. Roughton, B.Sc., Kingston, Ont.
J. B. Saunders, B.Sc., Kingston, Ont.
J. P. Young, B.Sc., Owen Sound, Ont.

McGill University

Honour Graduates with Degree of B.Sc.

Students: Percival Elliott Biggar, B.Sc.—British Association Medal; Undergraduates' Society's First Prize and the Crosby Steam Gauge, and Valve Co's Prize for Summer Essay; Honours in Mechanical Engineering.
Harold Rudolph Bissell, B.Sc.—Honours in Mining Engineering.
Charles Lennox Brooks, B.Sc.—Honours in Chemical Engineering.
George Henry Desbarats, B.Sc.—Departmental Prize for Summer Essay; Honours in Electrical Engineering.
Harold Louis Humes, B.Sc.—British Association Medal; Milton Hersey Prize for Summer Essay; Honours in Metallurgical Engineering.
William Aubrey Messenger, B.Sc.—Prize for Summer Essay.
Harold Edgar Mott, B.Sc.—British Association Medal; Honours in Electrical Engineering.

Degree of M.Sc.

A.M.E.I.C.: Geoffrey J. Dodd, M.Sc., Montreal, Que.
Jr.E.I.C.: Albert E. MacDonald, M.Sc., Halifax, N.S.
Students: James B. Brow, M.Sc., Charlottetown, P.E.I.
Charles L. Dewar, M.Sc., Ottawa, Ont.
Donald R. Harrison, M.Sc., Tamworth, Ont.
Charles U. Vessot, M.Sc., Ottawa, Ont.

Degree of B.Sc.

Jr.E.I.C.: David Whitney MacKeen, B.Sc., (Civ.), Halifax, N.S.
Harold Oswald Day Wilkins, B.Sc., (Me.), Norwood, Ont.
Students: Arthur Weston Ahern, B.Sc., (Chem. Eng.) Quebec, Que.
Lawrence Henry Armstrong, B.Sc., (El.), Montreal, Que.
Ross W. Bastable, B.Sc., (Me.), Lachine, Que.
Sidney Bonneville, B.Sc., (El.), Ottawa, Ont.
John Ross Bradfield, B.Sc., (Civ.), Morrisburg, Ont.
Edmund Vere Brown, B.Sc., (El.), Winnipeg, Man.
Cecil Edward Carson, B.Sc., (Chem. Eng.), Dorval, Que.
George Herbert Cartwright, B.Sc., Croydon, Surrey, Eng.
George Silas Clark, B.Sc., (Me.), Lachute, Que.
Charles A. O. Cousineau, B.Sc., (Civ.), Montreal, Que.
Robert Eric A. Crawford, B.Sc., (Me.), Montreal, Que.
Ross Newton Drummond, B.Sc., (Chem. Eng.), Montreal,
William James S. Evans, B.Sc., (Me.), Montreal, Que.
John Spencer Farquharson, B.Sc., (Chem. Eng.), Montreal, Que.
George Harold Fisk, B.Sc., (Civ.), Montreal, Que.
Robert Ford, B.Sc., (Me.), Ottawa, Ont.
Roy Holmes Foss, B.Sc., (Me.), Sherbrooke, Que.
Walter Stilson Gould, B.Sc., (Me.), London, Ont.
Ralph Glencoe Grant, B. Sc., (Chem. Eng.), Montreal, Que.
Israel T. I. Gurman, B.Sc., (Chem. Eng.), Montreal, Que.
Conway Hemsley D. Henderson, B.Sc., (Met.), Montreal, Que.
Everett Eric Holmes, B.Sc., (Me.), Westmount, Que.
George Elliott Kerr, B.Sc., (El.), Fernie, B.C.
John Mayer Loebel, B.Sc., (Chem. Eng.), Montreal, Que.
Louis Gustave Lorin, B.Sc., (Civ.), Montreal, Que.
William Raymond McClelland, B.Sc., (Met. Eng.), Halifax, N.S.
Stewart Lawrence MacDonald, B.Sc., (Mi.), Hamilton, Ont.
Donald Gordon Mackenzie, B.Sc., (Chem. Eng.), Montreal, Que.
Logan Seaforth McLennan, B.Sc., (Civ.), Vancouver, B.C.
Robert John Mitchell, B.Sc., (El.), Vancouver, B.C.
James Geoffrey Notman, B.Sc., (Mech. Eng.), Montreal, Que.
John Edmund Paddon, B.Sc., (El.), Montreal, Que.
Douglas E. Perriton, B.Sc., (Me.), Westmount, Que.
Richard Valentine Porritt, B.Sc., (Mi.), Cowichan Station, B.C.
Kenneth MacPherson Ramsay, B.Sc., (Me.), Quebec, Que.
Gordon Reed, B.Sc., (Civ.), Montreal, Que.
John Gordon Robertson, B.Sc., (Me.), Montreal, Que.
James Hargrave D. Ross, B.Sc., (Chem. Eng.), Montreal, Que.
Andrew Scott Rutherford, B.Sc., (Civ.), Westmount, Que.
Maynard James Spratt, B.Sc., (Civ.), Ottawa, Ont.
Lambert David Tatley, B.Sc., (Chem. Eng.), Westmount, Que.
Edward Plunket Taylor, B.Sc., (Me.), Ottawa, Ont.
Hartland Bates Wilder, B.Sc., (Civ.), Westmount, Que.
Selwyn Hamilton Wilson, B.Sc., (Me.), Ottawa, Ont.
Walter Richard Wonham, B.Sc., (El.), Westmount, Que.
Charles Desmond Woolward, B.Sc., (Civ.), Westmount, Que.

The similar list of Graduates of the University of Toronto will appear in the July issue of *The Journal*.

Invitation to A.I.E.E., Annual Convention.

The following very cordial invitation to all members of *The Engineering Institute of Canada* to attend the Thirty-eighth Annual Convention of the American Institute of Electrical Engineers, has been received at Headquarters:

"My dear Mr. Keith:—

This Institute is to hold its Annual Convention at the Clifton Hotel, Niagara Falls, Ontario, June 26-30, 1922, and at a meeting of our Board of Directors held this day, I was authorized to extend through you a cordial invitation to the membership of *The Engineering Institute of Canada* to attend our Annual Convention and to participate in the various technical sessions and other events.

I regret that I am unable to furnish a final programme at this date, but I am enclosing herewith proofs of an announcement that we expect to issue to our membership next week, and which may contain some information that will be of interest to you.

With best regards, I am,

Very truly yours,

Signed: F. L. HUTCHINSON,
Secretary."

While the final programme is not yet available, the Tentative Technical Program lists many very interesting papers, which are divided into the following classes:—

Class A: Four papers describing the Queenston Plant and its 45,000-kv. a. generators and transformers.

Class B: Three papers relative to the Standard of Rating of Class "B" Insulation, and Conventional Allowances for Generators.

Class C: Three papers relating to the Baltimore tests of Oil Circuit Breakers.

Class D: Six papers of the Symposium on Engineering Education.

Class E: Papers on a variety of subjects; ranging from mechanical engineering to pure physics.

Class F: A group of nine papers relating to Cable Insulation.

In Class A, are two papers to be presented by members of *The Engineering Institute of Canada;*

(1) The Queenston Plant, by F. A. Gaby, M.E.I.C., chief engineer, Hydro-Electric Power Commission of Ontario.

(2) Queenston Generators, 45,000 kv.a. Description of the Canadian General Electric Company's generator, 187½ revolutions per minute, vertical, 25-cycle, 12,000-volt, three-phase, by B. L. Barns, A.M.E.I.C., engineer, Canadian General Electric Co.

The Convention committee is composed of the following members, under whose direction the elaborate plans for the presentation of technical papers and the entertainment of those attending the convention have been prepared:

Chairman,—F. R. Ewart, M.E.I.C.,

Chairman, Meetings and Papers Committee, — E. E. F. Creighton;

Chairman, Sections Committee,— A. W. Berresford; H. G. Acres, M.E.I.C.; L. E. Imlay.; W. P. Dobson, M.E.I.C.; J. Allen Johnson.

Unveiling of Memorial Statue and Tablet.

To the memory of the men of the Canadian Pacific Railway who lost their lives in the Great War, and in honour of all those who served overseas, the company has erected a memorial statue and a bronze tablet at the Windsor Street station in Montreal. His excellency Lord Byng officiated at the dedication of the two memorials on the occasion of the unveiling on April 28th. The record of the company's employees during the war is one of which they might be justly proud; 11,340 men enlisted of whom 1,115 lost their lives in action or died of wounds, and 2,105 were wounded, while the decorations won include two Victoria Crosses, six Orders of the British Empire, seventeen D.S.O., three D.S.C., fifty-four M.C., forty-seven D.C.M., and one hundred and eighty Military Medals.

Memorial to the men of the C.P.R who lost their live in the war.

The Company's list of those who were killed in action includes two of the younger engineers of *The Institute*, John Henry Rosher, Jr.E.I.C., killed in action March 20th, 1915, and Lieut. Douglas M. Ewart, M.C., Jr.E.I.C. The late Mr. Rosher was born in London, England on June 12th, 1890 and received his education in Bedford, England. On coming to Canada in 1910, he was employed by the Canadian Pacific Railway Company, Irrigation Department, for four seasons on surveys and finally, as assistant engineer on location and construction of irrigation works at Bassano, Alta., which position he held at the time he enlisted. Mr. Rosher was admitted to *The Institute* as Student in 1911 and transferred to the grade of Junior on January 19th, 1915. The late Mr. Ewart was born at Ottawa, Ont., on February 8th, 1890; received his primary and high school education in Ottawa, and graduated with the degree of B.Sc. from McGill in 1910. He was appointed to the engineering staff on the Canadian Pacific Railway Company in 1910 and worked for three years near Ottawa as leveller, transitman, and assistant resident engineer, and was appointed in 1913 resident engineer for the company at West Toronto, Ont. Mr. Ewart was admitted to *The Institute* in 1909 as Student and transferred to Junior on August 18th, 1914.

OBITUARY

Harry Dean Bush, M.E.I.C.

In the death of Harry Dean Bush, M.E.I.C., on March 15th, 1922, at his home on Main Avenue in the city of Baltimore, the engineering profession has lost another of its most eminent members and profound regret is expressed on all side by his many friends, both within the profession and in the numerous spheres of social and business activities with which he was connected. Mr. Bush was born in Springfield, Massachusetts on April 2, 1857, and was descended, on both sides, from old New England families of colonial distinction.

He received his preparatory education in the elementary and high schools of his native city. Later he attended the Worcester Polytechnic Institute, whence he was graduated with honour, ranking second in his class and receiving the degree of Bachelor of Science. His special tastes were for science and mathematics. He was always a great reader and in the course of his life collected a large library of essays, romance, poetry and the drama.

Mr. Bush was a civil engineer of high standing and a business man of no mean ability. He entered upon the career of a civil engineer in the old R. F. Hawkins Bridge Works in Springfield and became, at the end of two years, bridge engineer for the Northern Pacific Railway Company, with headquarters at Portland, Oregon, After four years at Portland he was for one year assistant engineer in the office of George S. Morrison, New York City, and for three years superintendent of the bridge shops of the Dominion Bridge Company, Limited, of Montreal, Canada. After terminating his connection with the Dominion Bridge Company, Mr. Bush spent a year of travel and study in Europe and upon his return was again associated for two years with Mr. George S. Morrison of New York city, after which he went again to Portland, Oregon, where for three years he was engineer and superintendent for the contractors who constructed the Bull Run pipe line, twenty-four miles long, for the Portland city water works system, and the Steel gates for the Cascade locks, Columbia river, the largest ever built previous to the Panama canal.

Mr. Bush next became contractor for the pipe line for the water works system of New Bedford, Massachusetts, and in 1899, after an absence of ten years, returned to the Dominion Bridge Company as engineer in charge of the erection of bridges. In this capacity he had charge of the erection of the Royal Alexandra bridge across the Ottawa river at Ottawa, Ontario, and later presented a paper to the Canadian Society of Civil Engineers on the construction of this bridge, for which he was awarded the Gzowski medal, an annual prize given the writer of the paper or article of the highest merit on some phase of engineering.

In 1903 Mr. Bush came to Baltimore and became vice-president and manager of the Baltimore Bridge Company, then recently organized. It was through his untiring energy and devotion that this company soon acquired a well-deserved reputation of the highest standard, furnishing steel bridges and building for the Baltimore and Ohio and other railroads, the notable steel arch bridge over the spillway of the Croton dam for the New York City Aqueduct Commission, and much work for export, including all of the bridges in the Guatemala Railway system, bridges in Costa Rica, sugar mills in Cuba and several important contracts for the Isthmian Canal Commission. It was largely due to his work that the Baltimore Bridge Company was acquired by the Carnegie Steel Company about 1912, and as a result of this new connection the scope of the plant was greatly enlarged under his continued management.

In the Spring of 1911 a new industry was brought to Baltimore from Newark, New Jersey. This new concern was known as the Tube Bending and Polishing Machine Company and was backed financially by Miner C. Keith of New York, the president and owner of the Baltimore Bridge Company. Mr. Bush became president of this new company as well as of the compressed Copper Company, an organization subsidiary to it. The Tube Bending and Polishing Machine Company was later reorganized into the Baltimore Tube Company, Inc.

Mr. Bush was essentially a man's man and it has been said of him that he was pre-eminently a friend of men, especially young men. Sympathetic and kindly in his relations with men, he was never so happy as when enabled to render a good turn to one of his fellows. He was admitted to *The Engineering Institute of Canada*, then The Canadian Society of Civil Engineers, as Member on April 25 1901, and was a member of the American Society of Civil Engineers, the Engineers' and Whitehall clubs of New York city and the Baltimore Athletic Club.

Mr. Bush is survived by his wife, Francis Dent Bush.

PERSONALS

Stanley A. Neilson, Jr.E.I.C., has accepted a position with Walter J. Francis and Company, in Montreal.

D. Shaw, A.M.E.I.C., assistant engineer with the Canadian National Railways, has been transferred from Drumheller to the division engineer's office at Calgary.

Paul C. Kirkpatrick, A.M.E.I.C., who was previously located at Niagara Falls, Ont., is now with Fraser Brace, Limited, at Great Falls, Man.

B. B. Tucker, S.E.I.C., has returned to his home in England and is located at Kings Nympton, Chulmleigh, North Devon, England.

J. C. Gardner, A.M.E.I.C., who is a graduate of Toronto University of the class of '04, has recently been appointed to the position of road engineer for Welland county.

James A. McNicol, M.E.I.C., formerly resident engineer for the Canadian Pacific Railway at Winnipeg, has accepted a position with the Transportation Commission of Toronto.

P. J. Duff, A.M.E.I.C., of Philadelphia, Pa., is now a partner in the firm of Alkin and Duff Engineering Company, D5 Clive Building, Calcutta; mailing address, P.O. Box 2380, Calcutta, India.

W. R. Clarke, S.E.I.C., formerly engineer with the Nova Scotia Steel and Coal Company, is now with the Dominion Iron and Steel Company, Wabana, Newfoundland

James M. Begg, A.M.E.I.C., of Brandon, Man. is now in the Old Country, and communications addressed to "Greenbank", Cumnock, Ayrshire, Scotland, will reach him.

Sidney Harding, A.M.E.I.C., S.L.S., has recently opened an office for land surveying and general civil engineering in Punnichy, Saskatchewan. Mr. Harding previously carried on a similar practice in Regina.

H. L. Bucke, M.E.I.C., of the Niagara Peninsula Branch, has been appointed general superintendent in charge of the canal and river sections of the Queenston-Chipawa Power Development at Niagara Falls.

H. P. Borden, B.Sc., M.E.I.C., formerly of the Department of Railways and Canals, has opened an office for the purpose of carrying on a general consulting practice, specializing in bridges and structures, in steel and concrete, at 709 Hope Chambers, Ottawa, Ont.

W. G. Mitchell, B.Sc., M.E.I.C., until recently special technical representative of the Canadian Export Paper Company, Ltd., Montreal, has been appointed assistant to the president of Price Brothers and Company, Ltd., with headquarters at Kenogami, Que.

P. H. Mitchell, E.E., M.E.I.C., of the consulting engineering firm of C. H. and P. H. Mitchell of Toronto, has been appointed by Premier Drury to make an inventory of the materials and suplies used on the Chipawa power development.

Gabriel Henry, A.M.E.I.C., has been appointed superintendent of the Service of Maintenance and Improvement of Roads under the Ontario Provincial Roads Department, with which department Mr. Henry was formerly chief inspector of roads.

J. Rhind, S.E.I.C., and B. C. Rochester, S.E.I.C., have just completed their third year in electrical engineering at McGill University, and have taken out an agency for the Marconi Radio-Receiving sets with headquarters at 15 St. Mark Street, Montreal.

D. T. Main, M.E.I.C. who was for some time past located at Watervliet, New York, as vice-president of Bird Archer Company of New York, is now works inspector and sales engineer in charge of the Engineering Sales Department of the National Steel Car Corporation,Limited, in Hamilton, Ontario.

R. G. Ramsay, Jr.E.I.C., formerly assistant engineer to the resident engineer of the Department of Public Highways of Ontario, at Napanee, Ontario, has been appointed to the staff of the divisional engineer, Department of Public Highways of Ontario, Toronto-Montreal Division.

Lt.-Colonel H. F. Meurling, D.S.O., M.C., Croix de Guerre, of Vancouver, B.C., who has for many years been prominently connected with irrigation and reclamation projects in the west, has recently returned from England where he has spent the last fourteen months in connection with a land settlement project being considered by the syndicate of which Lt.-Col. Meurling is head.

H. A. Terreault, A.M.E.I.C., has been appointed director of public works for the city of Montreal. Mr. Terreault came to Montreal from Sorel, Que., where he was stationed in connection with Government work, to accept the position of superintendent of the municipal aqueduct department. His work in this capacity has earned him the recent promotion to the post corresponding to chief engineer of the city.

R. L. Hearn, A.M.E.I.C., of the Niagara Peninsula Branch, personal assistant to H. G. Acres, M.E.I.C., on the Queenston-Chipawa Power Development, has accepted an offer from the Washington Water Power Company to become their hydraulic engineer. He will leave for his headquarters at Spokane, Wash., in about a months time. The congratulations of the Branch and especially of those with whom Mr. Hearn has been associated on the staff of the Hydro-Electric Power Commission, are extended to him in his success.

George Hemmerick, A.M.E.I.C., of Conestogo, Ont. has recently completed the graduate engineers' course in economics at Queen's University. Mr. Hemmerick is a graduate of Queen's, in civil engineering, 1916, and prior to graduating was engaged on underground surveys at the Hollinger Gold Mines. Since 1916, he was first employed on D.L.S. work; then as resident engineer on construction of the Canadian Cordite Works at Nobel, Ontario; and more recently as resident engineer and attorney for E. G. M. Cape and Company, contractors on building construction at Montreal and La Tuque, Quebec.

H. S. Van Scoyoc, M.E.I.C., has recently been elected president of the Montreal Publicity Association by acclamation. Mr. Van Scoyoc is a graduate, in applied science, of the University of Pennsylvania 1907. Prior to coming to Canada he was on the city engineers' staff at Altoona, Pa. In July 1912 he was appointed inspecting engineer with the Canada Cement Company, with which company he is still associated. At present Mr. Van Scoyoc is consulting engineer to the Toronto-Hamilton Highway Commission and with the Canada Cement Company, Consulting Engineer Service and Promotional Departments.

Frank P. Vaughan, M.E.I.C., of St. John, N.B., was recently the recipient of the honorary degree of M.Sc., from the University of New Brunswick. Mr. Vaughan is widely known in connection with his electrical and scientific work. He was born in Liverpool, England in 1874 and was educated at Regent College, Southport, England. Since coming to America he has been continuously engaged on electrical engineering work first in British Columbia, and, in turn, in Nova Scotia, New Brunswick, Massachusetts and New York, returning to New Brunswick in 1902, where he has since been engineer and manager for the engineering and contracting company which bears his name. Mr. Vaughan is a Member of the American Institute of Electrical Engineers; the American Association of the Advancement of Science; and the American Electro Chemical Society; and an Associate Member of the Radio Engineers.

Lt.-Colonel H. L. Trotter, A.M.E.I.C., and C. L. Cate, A.M.E.I.C., have moved into new offices in the New Birks building, Montreal. Lt.-Colonel Trotter, who is a graduate of R.M.C., 1903, and was for eleven years prior to the war on the staff of Ross Holgate (and later, Henry Holgate), of Montreal, has, since returning from overseas, been with Messrs. Morrow and Beatty, contractors, as chief engineer on the construction of the new power plant of the Abitibi Power and Paper Company, on the Abitibi river. Mr. Cate is a graduate of McGill, 1909, and was on the staff of Henry Holgate during the years 1911 and 1912, and later, on bridge and dam construction in eastern Canada. He was overseas with the Imperial Naval Service, and upon his return, acted as district engineer for the Foundation Company, carrying out extensive alterations to the Lake St. Francis dam for the Quebec Government.

Lt.-Colonel C. N. Monsarrat, M.E.I.C., consulting engineer, Montreal, and Prof. C. R. Young, M.E.I.C., consulting engineer and assistant professor of structural engineering at the University of Toronto, are the Canadian representatives appointed on the advisory board of engineers in connection with the construction of the Detroit-Windsor bridge. Lt.-Col. Monsarrat was chairman and chief engineer of the board of engineers connected with the erection of the present Quebec bridge. According to the plans the bridge will have a clear span of 1,803 feet and a minimum clearance above water level of 110 feet, and when completed, Lt.-Col. Monsarrat said, will be the largest suspension bridge in the world. C. E. Fowler, M.E.I.C., vice-president and chief engineer of the American Transit Company of Detroit, is chief engineer of the advisory board, and in addition to Lt.-Col. Monsarrat and Prof. Young, the board includes, M. Pegran, chief engineer of the Interurban Rapid Transit Company, and Prof. Wm. H. Barr, consulting engineer, New York.

Lt.-Colonel Charles G. DuCane, O.B.E., A.M.E.I.C., who is well and favourably known in Canada, particularly in British Columbia where he was head of a successful consulting engineering organization, is now associated with the firm of Sir John Wolfe Barry & Partners, London, England.

Colonel DuCane has had a very interesting and successful military career. On the outbreak of war he enlisted for war service and was appointed superintending engineer on the construction of Witley camp which afterwards became a Canadian camp. In March 1915, he went to Russia to prospect a route for the Murman railway returning in July of that year. On August 21st 1915, he obtained a commission as Captain with the Royal Engineers and four days later was in France, second in command of the 3rd Labour Battalion, Royal Engineers, and in September 1916, he was appointed water-supply officer for the 3rd Army in France, and in January of the following year he formed and commanded the 352nd (electrical and mechanical) Company, R.E. with the rank of Major. He carried on the duties of water-supply officer of the 3rd Army and officer commanding the 352nd Company, R.E., from June 1918 to March 1919. He was attached to the staff of the engineer in chief, General Headquarters, France, as inspector of R.E. machinery with rank of Lt.-Colonel. The chief duties of this position included the acting as advisory, to engineer in chief, in all matters connected with water-supply schemes, materials, and plant, and workshops, as well as acting as liaison officer between the engineer in chief and the engineering operations of the various armies.

Lt.-Colonel DuCane was three times mentioned in dispatches, was granted the distinction of O.B.E., and on being demobilized on March 20th 1919, was granted the honorary rank of Lt.-Colonel.

One of The Institutes' Western Councillors.

Harry Linwood Johnston, Member and Councillor of *The Engineering Institute of Canada* and Member of the Professional Engineers of British Columbia, was born on August 29th, 1862, in Fredericton, N.B., and received his early education at the Fredericton Grammer School and through private tuition. Mr. Johnston's first engineering work was with the Canadian Pacific Railway, when at the age of twenty he went to Western Ontario as chainman on location surveys, and with the exception of two years as district engineer of the British Columbia Public Works Department, he has constantly followed his first field of engineering endeavour, railway engineering. The following chronological account of his rise in the profession shows the persistency with which he followed that first choice.

Commencing in May 1882, with the Canadian Pacific Railway as chainman, north of Great Lakes under H. E. C. Carry, M.E.I.C., and for eighteen years, between the years 1882 and 1905, with that company on location, construction and maintenance; in 1887 resident engineer at Algoma Mills under F. F. Busteed; in 1888 resident engineer on Seattle Lake Shore and Eastern Railway, near Spokane, Washington; 1891-1893, transitman on location and resident engineer

on construction with the Great Northern Railway in Cascade Mountains, Washington; 1894-1905, assistant engineer, engineer in charge and roadmaster on Canadian Pacific Railway in British Columbia; August 1905 to 1911, location and construction engineer on Grand Trunk Pacific Railway in Manitoba, Saskatchewan, Alberta, and at Prince Rupert, British Columbia. (This included charge of first fifty-three miles, Prince Rupert east, and estimating and finishing the first 103 miles); 1911-1917, location and construction engineer, Canadian Northern Railway and as division engineer stationed at Kamloops and Savona; 1917-1919, district engineer, Public Works Department of British Columbia at Vancouver; 1919—November 1920, division engineer Canadian National Railways at Armstrong, B.C., and from the latter date to the present time acting district engineer at Victoria, B.C.

Mr. Johnston was admitted as a Member in *The Institute* on June 19th, 1917.

The Engineering Index—1921

The Engineering Index for the year 1921 has just been published by the American Society of Mechanical Engineers. This volume is prepared along the general lines employed in the two previous volumes, issued since the publication was taken over by the Society, and contains indexed summaries of articles from over six hundred periodicals, published during 1921. The monthly index which appears each month in *The Engineering Journal* is prepared by the American Society of Mechanical Engineers and all abstracts of articles listed in *The Journal* during the year 1921 are included in the volume just issued. Abstracts of articles which have appeared since the close of 1921 are published monthly in Mechanical Engineering and *The Engineering Journal.*

EMPLOYMENT BUREAU
AND
MEMBERS' EXCHANGE

To make this department more valuable it is proposed that in future advertisements of situations vacant should state salary, and give details of requirements.

Situations Wanted

Civil Engineers and Draughtman

Graduate civil engineer, Jr.E.I.C., 28, single, desires position at once. Over two years experience in paper mills on general plant maintenance work, machine repairs, new installations, building revamping in concrete and steel, re-layout of machines with piping, etc. Design and detail for new construction and survey work. Good references. Salary expected \$165 — \$180. Apply Box No. 102.

Mechanical Engineer

Mechanical engineer, A.M.E.I.C., B.Sc., Canadian, age 29, single; seven years experience on air machinery and other machine design and as plant engineer. Open for immediate engagement, as mechanical engineer with machinery manufacturing firm or in similar work, preferably in Quebec or Ontario. Salary wanted \$275.00 per month. Apply Box No. 103.

Members' Exchange

Members having copies of the August 1921 issue of *The Engineering Journal* which can be spared will oblige the Secretary by mailling to headquarters.

* * *

Queen's Alumni of Montreal, Elect. Officers

At the fourth annual meeting of the Queen's University Alumni Association of Montreal, the following members of *The Engineering Institute of Canada* were elected to the executive:—R. O. Sweezey, M.E.I.C., President, A. C. Mallock, S.E.I.C., Secretary-Treas., B. E. Norrish, A.M.E.I.C., member of the Executive. Mr. Sweezey was also appointed as a member of the Council of the University.

ELECTIONS AND TRANSFERS

At the meeting of Council held on May 22nd, 1922, the following elections and transfers were effected: —

Members

Akins, James Robert, B.Sc., (Queen's Univ.) D.L.S., A.L.S., chief of party, Topog'l. Surveys Branch, Dept. of the Interior, Ottawa, Ont.

Goodwin, Leo. Frank, Ph.D. (Heidelberg), professor chemical engr'g., Queen's University, Kingston, and conslt'g. work.

Harcourt, Frederick Young, B.A., Grad. S.P.C., district engr., Port Arthur and Fort William District, Pub. Wks. Canada.

Hill, Lionel Coke, special designer and representative, John S. Metcalf Co., Montreal.

Jones, James Dyer, general manager, Algoma Steel Co., Sault Ste. Marie, Ont.

Marshall, John H. G., B.Sc., (Queen's Univ.), patent examiner, Patent Office, Ottawa, Ont.

Meadows, William Walter, (Grad. S.P.S. Univ. of Toronto), O.L.S., district surveyor and engr., Dept. of Highways, Regina.
Morgan, A. Hedley, works mgr., and engr., E. Leonard & Sons, London, Ont.
Shanks, Thomas, B.A.Sc., (Univ. of Toronto), D.L.S., Acting Surveyor General in charge of Topog'l. Surveys Branch, Dept. of the Interior, Ottawa, Ont.
Turner, John Harrison, of Coalhurst, Alta.
Underhill, George Gardner, C.E. (Cornell Univ.), director and mgr., Fraser Brace, Ltd., Montreal, Que.
Waugh, Bruce Wallace, B.A.Sc. (Univ. of Toronto), D.L.S., Topog'l. Surveys Branch, Dept. of the Interior, Ottawa, Ont.

Associate Members

Clark, Hial Jackson, B.A.Sc., (Univ. of Toronto), asst. and supt., H. T. Routley, highway contractor and engr., Toronto, Ont.
Dale, William Percival, B.A.Sc., (Univ. of Toronto), township engr., for the township of Stamford, Welland County, Niagara Falls, Ont.
Fletcher, Hugh Murray, (Grad .S.P.S. Univ. of Toronto), of Hamilton, Ont.
Fraser, Robert James, hydrographer and officer in charge, Gulf of St. Lawrence Hydrographic Surveys, Dept. of the Naval Service, Ottawa, Ont.
Garland, Charles H. B., (Grad. R. M. C. Kingston), asst. to engr. in charge, Geo. C. Graves Constrn. Co., Ottawa, Ont.
Hamel, Fernand Omer, acting senior mech. engr., Heating and Ventilation, Dept. Public Works, Ottawa, Ont.
Hotchkiss, Cyrus Percival, B.Sc. (Univ. of Alta.), D.L.S., A.L.S., chief of party, D.L. Surveys, Dept. of the Interior, Ottawa, Ont.
Hughson, William George, B.Sc. (Queen's Univ.), surveys laboratory, Dept. of the Interior, Ottawa, Ont.
Macdonald, Colin Stone, D.L.S., chief of party, Dom. Land Surveys, Ottawa, Ont.
Moore, Thomas John McLuckie, power development engr., Ont. Hydrometric survey, in charge of work and surveys in Northern Ontario, North Bay, Ont.
Murphy, Stephen John, B.Sc. (McGill Univ.), Topog'l. Surveys Branch, Dept. of the Interior, Ottawa, Ont.
Planche, Clifford Carlyle, B.Sc. (McGill Univ.), junior hydrometric engr., Dominion Water Power Branch, Calgary, Alta.
Prittie, Lloyd Conn, B.Sc. (Queen's Univ.), asst. patent examiner, Patent and Copyright Office, Ottawa, Ont.
Ralph, John Herbert, electrical engr., Dept. of Public Works, Ottawa, Ont.
Rowley, Harry William, B.Sc., (Mich. Agric. Coll.), district water-master, under S. G. Porter, C.P.R., Dept., Natural Resources, Coaldale, Alta.
West, Arthur Elemere, chief dftsman., Canadian Bridge Co., Walkerville, Ont.

Juniors

Drybrough, John, of Toronto, Ont.
Kuhring, Paul Ludwig, Junr. engr., River St. Lawrence Ship Channel, Marine Dept., Ottawa, Ont.
Libby, Philip Nason, B.S., (Forestry — Univ. of Maine), of Montreal, Que.

Associates

Jarvis, Richard Raymond, manager, Marks & Clerk, Ottawa, Ont.
Trainer, David, building contractor, Calgary, Alta.

Transferred from the class of Associate Member to that of Member

Bucke, William A, B.A.Sc., (Univ. of Toronto), manager, apparatus sales dept., Can. Gen. Elec. Co., Toronto, Ont.
Cameron, Joseph George, B.Sc. (Queen's Univ.), county engr., under the "Highways Improvements Act" for the united counties of Stormont, Dundas & Glengarry.
Carpenter, Henry S., B.A.Sc., (Univ. of Toronto), D.L.S., S.L.S., O.L.S., deputy minister and chief engr., dept. of highways, Regina, Sask.
Connor, Arthur William, B.A., C.E. (Univ. of Toronto), consltg. and supervising struct'l. engr., Toronto, Ont.
Hogg, Thomas H., B.A.Sc., (C.E.) (Univ. of Toronto), acting hydraulic engr., H.E.P.C., of Ontario, Toronto, Ont.
Mackenzie, Allan Campbell, engr., mtce. of way, Eastern Lines, C.P.R., Montreal, Que.
MacKinnon, George Douglas, B.A.Sc., (McGill Univ.), Vice-Pres., and Managing Director, MacKinnon Steel Co., Ltd., Sherbrooke, Que.
Rankin, John, B.A.Sc., (McGill Univ.), of Ottawa, Ont.
Sutherland, William H., B.A.Sc., (Univ. of Toronto), asst. engr., Montreal Water & Power Co., Montreal, Que.
Trotter, Harold L., (Grad. R.M.C. Kingston), Trotter & Cate, civil electrical engrs., New Birks Bldg., Montreal Que.
Winterrowd, William Holland; B.S. M.E., (Purdue Univ.), chief mech. engr., C.P.R., Montreal, Que.

Transferred from the class of Junior to that of Associate Member.

Adams, William Douglas, (Grad. R.M.C. Kingston), asst. engr., Toronto Transportation Commission, Toronto, Ont.
Crouch, William Wesley, B.C.E., (Univ. of Manitoba), res. engr., Black & Veatch, consltg. engrs., Kansas City.
deValter, Roger Audoir, junior engr., district of Quebec, Dept. Public Works, Canada.
Johnston, Bruce Alexander, B.C.E. (Univ. of Manitoba), bridge engr., Good Roads Board, Manitoba, Winnipeg, Man.
Johnston, George William Frederick, B.A.Sc., (Univ. of Toronto), contracting engr., Canadian Des Moines Steel Co., Ltd., Chatham, Ont.
Schofield, Stewart, B.C.L.S., engr., architect's office, C.N.R., Winnipeg Man.

Transferred from the class of Student to that of Associate Member.

Grange, Edward Rochfort, B.A.Sc., Univ. of Toronto), Air Certificate Examiner, Air Board, Ottawa, Ont.
Stark, William Hardy, B.A.Sc. (Univ. of Toronto), instr'man., Niagara Falls Power Co., Niagara Falls, N.Y.

Transferred from the class of Student to that of Junior.

Campkin, Wilbert Lee, head switchman (asst. wire chief), Sask. Govt. Telephones, Regina, Sask.
Fultz, Stephen Lloyd, B.Sc., (C.E.), (N.S. Tech. Coll.), res. engr., and asst. supt. on constrn., Nova Scotia Power Commission, Halifax, N.S.
Malone, Charles Edmund, of Kingston, Ont.
Paterson, David Roy, asst. city engr., Galt, Ont.
Pearson, Charles, constrn. engr., on rly. constrn., La Romana, Santo Domingo.

BRANCH NEWS

Montreal Branch

J. L. Busfield, M.E.I.C., Secretary-Treasurer.

Railway Refrigerator Car

On Thursday evening, April 20th, with F. A. Combe, M.E.I.C., presiding, W. H. Winterrowd, A.M.E.I.C., chief mechanical engineer of the Canadian Pacific Railway gave an address on a "Railway Refrigerator Car". Following the address there was a discussion in which a number of members took part. It is anticipated that Mr. Winterrowd's paper will be reproduced in a future issue of *The Journal.*

Recent Developments in Concrete

On Thursday evening, April 27th, the last meeting of the season, an address was given on the above subject by Lieutenant-Colonel H. C. Boyden of the Portland Cement Association. Colonel Boyden's address was largely based on the results of the experiments which have been made since 1914 by Professor Abrams of the Lewis Institute, Chicago.

The speaker said that until recent years the progress of concrete had been left to constructors supplemented with some laboratory investigation on a small scale. As a result of lack of definite knowledge erroneous ideas had developed, and because of such ideas enormous losses have been caused. In the United States last year, a year not normal in construction, $1,000,000,000 had been spent for concrete in various forms. Owing to the fact that the fundamental laws of mixing had not been carried out, that work could have been increased in value by 25 per cent, and in his personal opinion 33 per cent, a loss in value alone of from $250,000,000 to $330,000,000. Briefly, the owners were not getting what they had paid for.

Colonel Boyden then explained the foundation of the laboratory, where tests are conducted at the rate of 75,000 a year. The head of the Institute had been given an ample endowment, not to waste, but enough to carry out experiments and investigation until he was able to find out the right answer. It was five years before the first investigations were made known. Some investigations had been going on for two years and the solution would not be arrived at for two or three years, and perhaps ten, but it would mean the right answer, and it would not be given out until ready. There was only one instruction given to Professor Abrams, and that was: Find out all about Concrete. As a result of the work already done, Colonel Boyden said that he was able to deal with known facts.

There followed a review of the mixing of concrete, a talk on the ingredients, cement, sand, stone and water, with emphasis laid upon the necessity for clean sand. It was pointed out that dirty sand would lessen the compressive strength of concrete by 25 per cent. While much discussion had taken place about the first three ingredients, the water had been practically neglected and yet water was the controlling factor in the making of good concrete. This led to a lengthy review of the water-cement ratio. The less water used for a given amount of cement the stronger the concrete. The more water used, the weaker the concrete.

Colonel Boyden dealt with the new form of specifications, criticized building codes and declared that many designers were working on the factor of safety, because they had not the courage to say to the contractors: Give us the proper concrete. Under the new knowledge it is possible to buy concrete as a finished product.

As an example of construction erected under the Abrams specifications, Colonel Boyden instanced the new building of the Canada Cement Company on Phillips Square, Montreal, a $2,000,000 structure, where the average variation was only 1 3/10 per cent from the desired result. This he quoted as an example of the manner in which the members of the association are willing to work upon their own ideas.

The lecturer went into many details of his views on practical mixing, and later gave a number of views to indicate the proper consistency. Some of it poured so freely as to be termed "soup" and that was regarded as a very poor form indeed. The hardening of concrete, was not, he said, a drying out process but a chemical action. By keeping concrete wet for twenty-one days it would double the compressive strength and wearing ability.

At the close of the lecture there was a long discussion which lasted until after midnight. O. O. Lefebvre, M.E.I.C., chairman of the Civil Section of the Branch, presided.

Papers for 1922-23 Season

There was recently held a full meeting of the Papers and Meetings committee of the Branch, under the chairmanship of H. W. Fairlie, A.M.E.I.C. The chairmen of the various Sections are now engaged in arranging a programme for next season and it is hoped that any member who may be thinking of preparing a paper, will communicate with a member of the Papers and Meetings committee as given on the folder of Montreal Branch officers, recently mailed to all members.

Border Cities Branch

J. Clark Keith, A.M.E.I.C., Secretary-Treasurer.

The April monthly meeting of the Border Cities Branch was held in the Cadillac Cafe on the 21st., having been postponed for one week due to Good Friday. At the request of the chairman who was unavoidably absent, W. H. Baltzell, M.E.I.C., occupied the chair. Regret was expressed at the absence of M. E. Brian, A.M.E.I.C., due to illness. At the time the notices were posted Mr. Brian was to have been the speaker for the evening and the branch had looked forward with much interest to his "Experiences as City Engineer". The following members were present: Messrs. Baltzell, Bowman, Considine, Fletcher, Flett, Johnston, Keith, McIntyre, McMordie, Nelles, Newman, Porter, Smith, Thorne. The minutes of the previous meeting were read and approved.

The opinion was asked of the meeting if it was their desire to proceed with the election of a vice-chairman. After this was affiirmed, W. H. Baltzell, M.E.I.C., was elected, on the first ballot, as vice-chairman for the balance of the ensuing year.

J. J. Newman, M.E.I.C., read a communication from Willis Chipman on the progress being made with legislation in Ontario. The secretary announced that Colonel Boyden of the Portland Cement Association has been secured as the speaker of the May meeting to be held on the 19th. It was suggested that an invitation be sent to the secretary and all members of the local branch of the Institute of Architects. It was also decided that in view of the wide spread interest in concrete that an open meeting be held, that dinner be dispensed with and that suitable quarters be obtained for the meeting.

The Papers committee provided a most interesting and profitable evenings entertainment by securing four speakers to address the branch briefly on any subject they desired. The papers were varied and the discussions were entered into by everyone present.

A. J. Bowman, A.M.E.I.C., chose as his subject "Roads". The Essex Border peninsula is deficient in stone and the roads here are therefore of gravel or concrete, the gravel being obtained from the rivers and transported by rail or boat. If by boat, it is handled in three stages; screening and loading — to the skip — the mixer — then finishing. Flat screens prove more efficient than rotary or cylindrical. This item of cost may run from five to forty cents a yard depending on the capital outlay.

On large jobs, industrial rail provides cheapest haul, while trucking comes next if haul is from one to five miles. Teams can compete with trucks on a two-mile haul if roads are sandy or if light bridges are an obstacle. On short hauls of one-half mile or less it should be direct from loading bin to hopper, to mixer so as to eliminate a wastage of 5 to 10 per cent in deposition. The annual overhaul cost of plant is from 10 to 15 per cent of the capital outlay. The various methods of finishing roads were presented in detail. Discussion centered on the cracking of concrete roads. The speaker thought it could be attributed largely to poor rolling plus improper drainage. J. J. Newman, M.E.I.C., believed that as long as a road bed is uniform, rolling is secondary. If there are fills on the side, then rolling is important.

E. F. Considine, M.E.I.C., dealt with "Inconsistencies in specifications on the same kind of work in different jobs", more particularly in relation to timber crib breakwaters. He quoted from specifications on three Public Works Department contracts at Port Arthur, Toronto and Fort William. In one case all stone between 333 lbs. and 1,000 lbs. was rejected, in another the rejection limits were 150 lbs. and 450 lbs. while on the third, all stone between 150 lbs. and 4,000 lbs. could not be used. As any large breakwater job was necessarily a quarry proposition it was obvious that with the above variation in specifications that there would be a large percentage of quarried rock wanted. The quarrying cost would run from 30 cents to 50 cents a ton and one of two parties had to pay for it; the contractor or the owner.

Alex May gave the meeting the choice of two subjects, "Radio — Telephone" or "Engineering in India," and it was evident that the former is a popular pastime with members of the Branch as they were unanimous in its selection. There are two uses of the wireless telephone that present advantages from the standpoint of the transmission system operator. The first is the "wired wireless" (really current carrier in which a high frequency current is used), and the second is the radio telephone which has developed from the radio telegraph. A rough estimate at the present time shows that there are 25,000 amateur transmitting stations in the United States and more than 600,000 receiving stations.

Present radio laws were established before the time when the radio telephone came into the field on a basis that would permit of more than experimental work. The broadcasting of musical programmes was thought to interfere with other radio traffic and a conference was recently held in Washington to draft regulations and legislation. Interference by amateurs and certain atmospheric conditions present two problems to the commercial operator. The dangers due to improperly grounded amateur sets was dwelt upon at length and this one phase of the question entered largely into interesting discussion.

J. S. Nelles, A.M.E.I.C., chose a subject which in view of the interest of this district in the present Minister of Railways was very appropriate. He dealt with the Hudson Bay railway which forms part of the system of Government railway lines. The total length when constructed from The Pas to Port Nelson will be 424 miles of which 214 miles are now in operation, steel having been removed from 118 miles for war purposes. Grading has been completed throughout. The rail and boat haul from central Saskatchewan to Liverpool via Port Nelson is shorter by 900 miles than via Montreal to say nothing of the saving in rail haul. The country is not generally suited for agriculture but is rich in minerals, fish and fur bearing animals. The difficulties of construction were touched upon with particular reference to frost which is permanent a short depth below ground surface.

Peterborough Branch

D. L. McLaren, A.M.E.I.C., Secretary.

"Recent Developments in Concrete"

On April 24th the Peterboro Branch were given an opportunity to hear a very interesting lecture on "Recent Developments in Concrete", given by Colonel H. C. Boyden of the engineering staff of the Portland Cement Association. For the past year the speaker has been giving similar addresses before various engineering and public organizations, both in the United States and Canada.

Colonel Boyden sketched briefly the history of the cement industry, and spoke regarding the method of mixing and pouring concrete as recommended by the Portland Cement Association, in that the concrete structures are designed for a certain stress in the concrete, and the concrete is made with the proper proportions of cement, sand, stone and water, to give this required strength. He also stated that the engineers for the Hydro Electric Power Commission had adopted this practice in the construction of the Queenston - Chippawa canal with most satisfactory results.

"Scientific Industrial Research"

On April 27th a very interesting and instructive address was given by Colonel F. M. Gaudet, C.M.G., M.E.I.C., technical executive officer of the Research Council of Canada. The speaker outlined the need of a laboratory for scientific and industrial research, and he gave the following examples, to show that such research pays:—

1. American industries are spending $20,000,000 each year for scientific research. They know that it pays. The United States Federal and State Government appropriated $57,000,000 for research in 1919.
2. The General Electric Company investigated the properties of tungsten, and by the use of a few hundred pounds for electric lamps, a saving of $250,000,000 annually is made in the United States alone.
3. E. I. DuPont de Nemours and Company of Wilmington, Delaware, manufacturers of explosives and chemicals, estimate that their research laboratory has yielded a profit of $82,401,000 from 1912 to 1918, inclusive. This represents an annual rate of 1,370 per cent on their investment for research.
4. The Gayley invention of the dry air blast in the manufacture of iron, saves $30,000,000 a year.
5. The American Telephone and Telegraph Company has appropriated $25,000 a year for five years, to be used by the American National Research Council.
6. The Mellon Institute was established by the Mellon brothers, bankers of Pittsburgh, (one of whom is now head of the Treasury Department at Washington), shrewd business men, who know that it pays to provide manufacturers with a scientific laboratory. They have recently donated an additional sum of $1,500,000 to their original gift of several millions to the Institute which bears their name.
7. As a result of discoveries made at the Mellon Institute, the American Bread Company has been able to save $1,500,000 a year in one of its departments.

8. John D. Rockefeller, looking about for the best way to make his great fortune serve humanity, set apart $200,000,000 for scientific research.

9. Highly organized research in the development of agricultural machinery has, in the United States, reduced the labour cost of seven crops by $681,000.000 as compared with the methods of only fifty years ago.

10. The work of Coolidge and Langmuir, in developing the nitrogen tungsten lamp now extensively used, has reduced the consumption of the electric current to one-seventh of the former quantity.

11. Michael Faraday discovered the principle of the dynamo electric machine in the last century, and, without this knowledge, the whole art of electrical engineering could not exist. The value of electri power generated in Canada is $60,000,000 of which one-third is exported

12. The telephone was invented by Dr. Alexander Graham Bell, a Canadian scientist, and Canada has nearly one million telephones representing a capitalization of $100,000,000. The telephone company spend annually for research, the results of which are all about us, a sum greater than the total income of many universities, and the enormous amount saved by the use of the telephone is incalculable.

13. The Frasch process of refining crude sulphur-bearing Canadian and Ohio oils has increased their value sevenfold.

14. Aluminum was discovered by a German chemist, and originally cost $90 a pound. It is now manufactuted at Niagara and Shawinigan Falls, and the scientific work done by Hall and Heroult has reduced the cost from $90 to 22 cents a pound.

Annual Meeting

The Annual Meeting was held on the 11th inst. Reports were received from the chairman, secretary, treasurer, and convenors of the various committees and the officers for the ensuing year were elected.

The General Secretary of *The Institute*, Fraser S. Keith, M.E.I.C., was present and spoke to the Branch on Institute affairs.

Victoria Branch

H. M. Bigwood, A.M.E.I.C., Secretary.

The chief activity of the Branch during April has been concerned with the new Esquimalt dry dock under construction by P. Lyall and Son Ltd., for the Dominion Government. At the regular meeting held on Wednesday, April 26th, J. P. Forde, M.E.I.C., district engineer of the Public Works Department of Canada explained in detail, with the aid of plans and photographs, the nature of the work and the progress made up to the time work was suspended at the end of March.

A visit to the site of the work took place on Saturday, April 29th. about forty members attending, among whom was J. G. Sullivan, M.E.I.C., president of *The Institute.* The description of the work given a few days previously by Mr. Forde was of great assistance to those visiting the work, enabling them to follow the course of construction without effort.

The contractors staff and the government engineers were untiring in their efforts to show and explain all details, their attention being much appreciated.

From the new work the party proceeded to the existing dry dock, a very small affair of 450 feet in length as compared with 1,125 feet for the new dock when completed. Much interest was shown in the pumping machinery with which this basin is equipped and which was built by James Watts, Birmingham, England, in 1876 and has been in continuous operation since about 1886.

At one o'clock the whole party met at lunch and the chairman of the Branch, P. Philip, M.E.I.C., took the opportunity to extend a hearty welcome from the Victoria Branch to the President of *The Institute.* Mr. Sullivan acknowledged the remarks in a short speech which while it was delivered in a few minutes left food for thought to occupy the minds of his hearers for a much longer time.

The branch has changed its headquarters from Belmont House to 25 Brown Building, Victoria. The executive were guided by two considerations in deciding on the change, economy and a desire to be more centrally located, both objects have been achieved.

During May a visit will be made to the Bamberton plant of the British Columbia Cement Company, and an address on concrete will be given by Professor Duff A. Abrams, M.E.I.C. director of the Structural Materials Research Laboratory, Lewis Institute, Chicago.

Cape Breton Branch

Kenneth G. Cameron, A.M.E.I.C., Secretary-Treasurer.

On Tuesday April 25th, a special meeting of the Branch was called to meet Walter J. Francis, M.E.I.C., vice-president of *The Institute,* who was in the City for one day only. Previous to leaving on the evening train, he addressed some thirty members on general Institute affairs. He mentioned in particular that *The Institute* in its present condition really resolved itself into an aggregation of Branches, with whom the chief activities rested, the policy being guided by Headquarters and Council.

One of the chief difficulties faced is that of distance, making the conduct of business and management at Headquarters both onerous and lengthy. Mr. Francis spoke of the work of Council and its methods of procedure, and also of the work covered during the recent meeting of the committee on Policy. In order to achieve success he emphasized the absolute necessity of co-operation.

Mr. Francis' address was much appreciated and, while it was regretted that his time was so limited, the sincere thanks of the Branch were extended to him for having made time to meet us.

Annual Meeting

The annual meeting of the Branch was held on May 9th; very poor weather conditions causing a small attendance. The secretary read the annual report which follows:—

Mr. Chairman and Gentlemen:—

The last annual report submitted May 26th 1921, covered only the five months since the Branch was started. This report, therefore, is the first to cover a full year's operations.

Membership

When the Branch was started there were seventeen members of all grades in the district. At the time of the last annual meeting the roll stood at fifteen, with nineteen applications pending. Today there are eight applications pending with forty-one members in good standing, made up as follows: nine Members, twenty-four Associate Members, six Juniors, one Student, and one Associate.

Meeting

During the past Winter session six regular meetings have been held as follows:

Nov. 9th.	General Business.
Dec. 9th.	Paper by W. S. Wilson, A.M.E.I.C.
Jan. 6th.	Paper by R. M. McKinnon, A.M.E.I.C.
Feb. 9th.	Paper by Geo. D. Macdougall, M.E.I.C.
Mar. 9th.	Paper by S. C. Mifflen, A.M.E.I.C.
Apr. 4th.	Paper by I. W. Buckley, A.M.E.I.C.

In addition two special meetings have been held; a dinner and social on March 23rd, and a meeting addressed by Mr. Francis, vice-president of *The Institute*, on April 25th; making eight meetings in all.

Ten meetings of the Executive committee have been held during the year. In addition to routine business, the principal work covered was consideration and classification of applications, business arising from the Branch Secretarial Conference, particularly extensive revisions of bylaws, and consideration of the request of the Minister of Public Works for co-operation in regard to the Provincial Act covering boiler manufacture and inspection.

Financial Statement

Although the finances of the Branch can hardly be said to be in a flourishing condition, it has still been possible to complete the year with a favourable balance. Considering the size of the Branch, we have undertaken more than is usual with other Branches of the same size in the matter of the rental for rooms, and, while this has necessitated making a local contribution, it is still to the credit of the Branch that, in spite of hard times, the members have responded sufficiently well to enable us to keep clear of debt so far. In order to maintain this position, and to accumulate a small surplus sufficient to meet emergencies, members are asked to co-operate to the best of their ability in this matter.

The balance in hand at the last annual meeting was	$40.08
Total receipts for the year have amounted to	174.01
Total expenditures for the year amount to	207.73
Leaving a balance in hand on May 8th 1922, of	6.36

Details of the financial statement were appended. On the motion of D. S. Morrison, A.M.E.I.C., seconded by C. S. Creighton, Jr.E.I.C., the report was received and adopted.

The chairman, C. M. Odell, M.E.I.C., then read the report of the scrutineers, and declared the following officers elected,—

Chairman, C. M. Odell, M.E.I.C.
Secy-Treas. K. G. Cameron, A.M.E.I.C.
Exec. Com. (one vacancy, 1922-24) A. W. MacMaster.

It was moved by S. C. Mifflen, A.M.E.I.C., seconded by A. W. MacMaster, A.M.E.I.C., and carried, that for the future the secretary be exempted from paying local dues.

The chairman then asked that all members who had any ideas which would contribute to the success of the Branch would bring the same forward; adding that while the executive was doing its best in the members' interest, they would nevertheless appreciate any constructive criticism.

Speaking of the coming meetings of the Mining Society of Nova Scotia in Sydney, Mr. Odell then, as vice-president of that Society, issued an invitation to all members of the Branch to be present at the meetings.

At the conclusion of the official business, the chairman gave a short address on the subject of Transportation.

On the following Thursday, a meeting of the Executive committee was held, when K. H. Marsh, M.E.I.C., was appointed vice-chairman of the Branch. Mr. Marsh is chief engineer of the Dominion Steel Corporation and during the past year has acted as chairman of the Papers and Meetings committee, and the Branch is much indebted to him for his energetic work in that connection which has contributed so largely to the successful season just past.

At the same meeting the following Papers and Meetings committee was appointed for the ensuing year,—

H. Longley, M.E.I.C., K. H. Marsh, M.E.I.C., T. J. Brown, M.E.I.C., C. C. Curtis, M.E.I.C., and S. C. Mifflen, A.M.E.I.C.

Niagara Peninsula Branch

Rex. P. Johnson, A.M.E.I.C., Secretary-Treasurer.

The annual meeting this year was the occasion of a dance held at the Prince of Wales hall in St. Catharines on May 5th. A special car was run from Niagara Falls and this, along with several motors, conveyed about twenty couples to the festive gathering. About sixty couple participated in a very enjoyable evening and the members are much indebted to the excellent work of the committee in charge of the arrangements. The decorations were novel and typical, consisting of a camp fire setting and a skilful arrangement of transits, levels, rods, pickets, chains, etc. The orchestra platform was artistically decorated with palms and flowers. The dance committee consisted of F. S. Lazier, M.E.I.C., chairman; R. W. Downie, S.E.I.C., Secretary and W. H. Sullivan, M.E.I.C.

The necessary business was conducted by the chairman during the intermission. This consisted of the presentation of the annual report and financial statement, which the chairman advised would be published in *The Journal*, and the report of the scrutineers on the ballot for new officers and Executive committee. A vote of thanks was passed to the officers and Executive committee for its services to the Branch during the past year; to Mr. Grant for the use of a lantern on many occasions and to Mr. Butler for arranging for its transportation and operation, and to the Annual Meeting committee who so successfully arranged the evenings entertainment.

The new officers and executive committee are as follows:—Chairman, F. S. Lazier, M.E.I.C.; Vice Chairman, S. R. Frost, A.M.E.I.C.; Secretary-Treasurer, R. P. Johnson, A.M.E.I.C.; Executive Committee, F. W. Clark, (elected for a two year term), A. Milne, (elected for a two year term), R. W. Downie, S.E.I.C., (elected for a one year term) F. E. Sterns, A.M.E.I.C., (who is a member of the executive for his second term); Ex-Officio members, N. R. Gibson, M.E.I.C., Past Chairman, A. C. D. Blanchard, M.E.I.C., Councillor, H. G. Acres, M.E.I.C., Vice-President, Lt.-Col. R. W. Leonard, M.E.I.C., Past President.

Annual Report—April 1922

To the members of ihe Niagara Peninsula Branch;—

The following report is a supplement to the annual report presented to Council at the last annual meeting of *The Institute* and completes the record of the Branch activities to the end of the Branch year.

During the year the Branch has held five general meetings, two trips of inspection and four meetings of the Executive committee. A policy of holding general dinner meetings once a month during the winter has been followed. These meetings have been held alternately in St. Catharines and Niagara Falls, with an average attendance of seventy-eight for the Niagara Falls meetings and fifty-five for the St. Catharines meetings, and an average for all meetings of sixty.

The Branch has again lent its efforts towards securing legislation. All the local members of the legislature have been interviewed by various members of the Branch and close touch has been maintained with the Advisory Conference committee throughout the period that this matter has been active.

The total membership has remained constant during the year with a total of one hundred and thirty-three. The detailed classification is as follows:—

	1921	1922
Members	19	19
Associate Members	74	75
Juniors	20	22
Students	17	14
Associates	2	1
Affiliates	1	2
	133	133

A financial statement is attached hereto.

Respectfully submitted,

N. R. Gibson, *Chairman*
Rex Johnson, *Sec.-Treas.*

Financial Statement

May 6, 1921 to April 15, 1922

Receipts

Bank Balance May 6, 1921	$229.47
Rebates on members fees from Headquarters Jan. 1st, 1921, to Dec. 31, 1921	184.01
Rebates from the Journal for Branch News, Jan. 1st, 1921, to Dec. 31, 1921	40.58
Affiliates Fees	10.00
Commission on Advertising for Journal	28.50
Receipts from Members for Annual Meeting 1921	151.00
Outstanding cheque	2.25

We, the undersigned auditors, have audited the books and accounts of the Niagara Peninsula Branch of the Engineering Institute of Canada, and the vouchers thereof, and find the same correct.

S. W. Johnston
Norman Malloch
Auditors

The final regular meeting of the season was held in the Engineers' Club at Thorold on Wednesday evening May 18th, with N. R. Gibson, M.E.I.C., in the chair.

The speaker of the evening, Lt.-Col. H. C. Boyden of the Portland Cement Association of Chicago gave a very interesting instructive illustrated address on "Recent Developments in Concrete." As Lt.-Col. Boyden has addressed several of our branches it is unnecessary here to go into any details of his lecture, but the underlying text of his remarks will well bear repetition and should be kept in mind by all engineers interested in concrete, that is, that we can now buy concrete, not as a formula, but as a finished product. An interesting discussion followed the lecture in which S. R. Frost, A.M.E.I.C., R. W. Downie, S.E.I.C., N. R. Gibson, M.E.I.C., J. A. Grant, M.E.I.C., F. C. Jewett, A.M.E.I.C., R. P. Johnson, A.M.E.I.C., T. V. McCarthy, A.M.E.I.C., and others took part. E. M. Procter, A.M.E.I.C., of Toronto instilled considerable vigour into the debate with a defense of the old pit-run gravel concrete, but the sympathy of the meeting appeared to be with the more scientific methods.

Halifax Branch

O. S. Cox, A.M.E.I.C., Secretary-Treasurer.

The monthly meeting for April was held at the "Green Lantern" at which the chairman of the Branch presided.

After the supper, the usual concomitant of these monthly gatherings, H. B. Pickings, A.M.E.I.C., gave an interesting and instructive paper on "Some Problems in Surveying", with special reference to the difficulties and embarrassments with which the surveyor is confronted in attempting to reach the necessary degree of accuracy and finally in the delimitation of "lots, pieces and parcels" of real estate and to reconcile errors and discrepancies between ancient and often crudely prepared plans, deeds and descriptions, and present conditions and boundaries of properties. It was difficult and often impossible to find or identify the ancient marks and monuments delimiting a piece of property and therefore correspondingly so not only to adjudicate equitably between a seller and a purchaser, but to satisfy the legal requirements in the often complicated process of transferring property from one owner to another.

In the discussion which followed the chairman expressed the opinion that a vast amount of trouble would have been saved, if in the descriptions of properties by metes and bounds the true or astronomical meridian had many years ago been made compulsory in all surveys, plans, deeds and descriptions of properties, instead of the generally used magnetic bearings which vary from year to year and by local attraction from place to place. One or two members spoke of the frequent and often incorrect use of the term "more or less" in deeds and descriptions. The author of the paper, was opposed to the use of the phrase "except in the rare case where it was unavoidable". Several other members spoke upon other features of the subject which, while not strictly engineering surveying, was one with which engineers often came in touch.

A special meeting of the Branch will be held on the 10th of May, when the members are looking forward to hearing a most interesting paper on "Recent Developments in Concrete" by Lieut. Col. H. C. Boyden, Chief Engineer of the Portland Cement Association of Chicago.

The annual meeting of the Branch for th eelection of officers and other important professional and routine business will be held sometime during the month of May.

Moncton Branch

M. J. Murphy, A.M.E.I.C., Secretary-Treasurer.

The regular monthly meeting of Moncton Branch was held in the Council Chamber of the city hall, Moncton, on Tuesday, May 9th., J. D. McBeath, M.E.I.C., chairman presided.

Lt.-Col. H. C. Boyden of the engineering staff of the Portland Cement Association gave a very interesting address on the various phases of the art of making concrete. The address was illustrated by lantern slides. The meeting was open to the public.

Col. Boyden's remarks were listened to by a very large and interested audience, who added much to the meeting by the varied questions asked, which the speaker seemed only too well pleased to have the opportunity of answering. Mr. McBeath spoke very highly of the benefit he personally received by listening to Col. Boyden's address, and tendered him a very hearty vote of thanks from the members of the Moncton Branch.

The annual meeting of Moncton Branch was held in the Mayor's office, city hall, Moncton, on Thursday evening, May 11th. The chairman, J. D. McBeath, M.E.I.C. presided.

Second Annual Report of the Executive Committee of Moncton Branch of the Engineering Institute of Canada for the period between May, 1921 and May, 1922

The first annual meeting of Moncton Branch was held in the city hall, Moncton, on May 5th 1921. At this meeting the result of the ballot for officers for ensuing year was announced, and reports were read.

The secretary of Moncton Branch attended the Secretaries meeting held in Montreal last January and at this meeting each secretary present gave an outline of the activities of his particular Branch, and Moncton Branch certainly compares most favourably with the other Branches of *The Institute*, both in attendance and interest shown by the members.

The attendance at our meetings during the past year has been very good, particularly at our supper meetings which have proved most popular. The Executive committee met eight times and transacted a considerable amount of business. There were four meetings of the Branch in 1921 and nine in 1922. Papers were read, addresses given, important business transacted and moving pictures displayed at the meetings, as follows:—

October 6th, 1921, Motion pictures showing the construction and flight of Aeroplanes. These films were loaned by the Air Board of Canada.

November 3rd, 1921. At a supper meeting, F. H. Williams, M.Sc., A.M.E.I.C., delivered an address on "Electric Welding and its application in Railway Repair Shops", illustrated with lantern slides.

November 23rd, 1921. Dr. Henderson of the New Brunswick Gas and Oil Fields, Ltd., delivered an address on "Petroleum and Gas Production".

December 1st, 1921. At a supper meeting, K. H. Smith, M.E.I.C. delivered an address on "Hydro-Electric Power Development."

January 5th, 1922. At a supper meeting J. Edington, M.E.I.C., delivered an address on "History of Moncton Water-supply", and Mr. Holgate, chief engineer of McKinnon Bridge Company gave an interesting outline on the "Steel Construction of the Sunny Brae Rink".

January 19th, 1922, E. G. Evans, M.E.I.C., delivered an address on the "Toredo Navalis" ("The Ship Worm").

February 2nd, 1922. At a supper meeting, H. B. Pickings, A.M.E.I.C., delivered an address on "Town Planning."

February 15th, 1922. R. G. Gage, M.E.I.C., delivered an address on "Railway Signalling and Interlocking". This meeting was held in the Science building, Mount Allison University, Sackville.

March 2nd, 1922. At a supper meeting, C. O. Foss, M.E.I.C., delivered an addredd on "Hydro-Power Development in New Brunswick".

March 16th, 1922. J. D. McBeath, M.E.I.C., chairman of Moncton Branch, delivered an address on "Municipal Engineering". This meeting was held in the Science building, Mount Allison University, Sackville.

April 6th, 1922. At a supper meeting, F. B. Tapley, M.E.I.C., delivered an address on "Railway Maintenance".

April 20th, 1922. J. P. Wood delivered an address on "Richibucto Harbour Developments".

May 9th, 1922. Lieut.-Col. H. C. Boyden, B.S., of the engineering staff of the Portland Cement Association delivered an address on "Concrete".

At our annual meeting the membership was 44, which has increased to 66, an increase of 50 per cent, our membership is as follows:—

Members	9
Associate Members	27
Juniors	8
Students	19
Affiliates	3
	66

The sincere thanks of the members of Moncton Branch are due Major Wm. McKee and the various ladies and gentlemen who so kindly provided entertainment at our supper meetings.

We still continue our policy of giving as much publicity as possible to the Branch, in order to stimulate public interest in our activities.

The financial statement which will be submitted by the secretary, shows a surplus of $14.26, but as there are three months rebates now due from Headquarters for Branch news and members dues, our surplus will be greatly increased when this cheque is forwarded to us.

J. D. McBEATH, *Chairman*
M. J. MURPHY, *Sec.-Treasurer.*

Retiring President's Address

Gentlemen:

As this is the last meeting at which it will be my pleasure to act as your chairman, a short review of our activities during the year 1921-22, with a few impressions and suggestions, will probably not be misplaced.

The Branch started the year with a total membership of 44 which has since increased to 66, a gain of 50 per cent.

We might be pardoned in saying that we are proud of this showing, especially when several of the other branches have not shown a very large percentage of increase.

Vancouver Branch

P. H. Buchan, A.M.E.I.C., Secretary-Treasurer.

British Columbia Professional Meeting.

Rapid progress is being made on the final arrangements for the British Columbia Professional Meeting, which is to be held in Vancouver on June 16th and 17th. The Canadian Pacific Railway has very kindly placed a suitable meeting room in the hotel Vancouver at our disposal and the Committee is confident that with the unsurpassed facilities afforded by this beautiful hostelry, the reception and entertainment of our visiting members should be a pleasure to them as well as ourselves.

A word of explanation as to the change in the name of our meeting will not be amiss. Previously, we have been referring to the "Western Professional Meeting": but on the advice of Mr. Keith, we believe that "British Columbia Professional Meeting" is a better name, for by its adoption we will avoid possible confusion with the approaching professional meeting to be held at Winnipeg. In this connection, we also feel that same apology is due our Prairie brethren for our seeming neglect to more fully consult them in making our plans. Our difficulty has been the time at our disposal, due to our having seized the opportunity afforded by the holding of the Canadian Good Roads Congress at Victoria during the previous portion of the same week in June. The adjustment of dates could not be accomplished without a certain amount of negotiation, which crowded our own arrangements to such an extent that we found it necessary to "take the bull by the horns", so to speak, and complete the programme locally. We thoroughly appreciate the assurances we have received, that we have the support and good-will of our Western members; and although we have been compelled, through force of circumstances, to precipitate matters, we wish them to believe that their welcome will be none the less hearty when we meet them at hotel Vancouver on June 16th.

In regard to papers, the committee has tried to present subjects which will be both instructive and entertaining. A paper on "Town Planning" is being prepared in Montreal by James Ewing, M.E.I.C., which is expected to be of special interest to residents of British Columbia. As it is the intentions of the committee to invite representatives of a number of our public bodies to hear this paper, we are hoping that further interest will be afforded by a well-conducted discussion. A second paper on "Irrigation in British Columbia" is being written by Ernest A. Cleveland, M.E.I.C., consulting engineer to Department of Lands, Victoria, B.C., which, it is believed, will be of particular interest to our members from the interior of British Columbia and the Prairie Provinces. The third paper on "Engineering in the British Columbia Logging Industry" which is being prepared by T. W. Fairhurst, A.M.E.I.C., Vancouver, centres on one of our principal industries; and with its accompanying lantern-slide illustrations, it is expected to be of unique interest to all, as the handling of our heavy timber on steep mountain slopes in the immense quantities now demanded by our mills, is an ever-varying problem.

A luncheon will be held in the hotel Vancouver at mid-day on Friday, followed by a trip to the new Ballantyne pier on Burrard Inlet which is a large reinforced concrete structure in course of construction, embodying the latest ideas in port facilities for an ocean terminal.

Saturday morning is being reserved for business and the discussion of welfare, Policy and the proposed revival of the British Columbia Provincial Division, attention to which has been drawn in recent issues of *The Journal*. Short addresses are being arranged for on these questions, and it is hoped that much good will result from a thorough discussion of these matters.

The business of the professional meeting will terminate at noon, Saturday June 17th. The afternoon will be devoted to sightseeing, arrangements for which are now being made, and which we trust will materially add to the enjoyment of our visitors.

Calgary Branch

J. A. Spreckley, A.M.E.I.C., Secretary.

Floyd K. Beach, A.M.E.I.C., Branch News Editor.

Much attention has been given by *The Institute* and its members in the past to engineering problems involved in the design and construction of irrigation works. The economic use of irrigation water after works are complete has often been considered rather in the realm of agriculture than engineering. W. H. Snelson, A.M.E.I.C., in addressing the Calgary Branch on April 28th, brought out very clearly the fact that many agricultural problems under irrigation belong to the engineer, and his study of them using his specialized training, is doing much to make the constructional engineering that preceded him and in economic success.

In his address, Mr. Snelson first dealt with the history of irrigation work in the Western Provinces, which work has been carried on since the year 1913. Special reference was made to the work at the Strathmore station, where duties-of-water investigations were carried on by the Dominion Reclamation Service in co-operation with the Natural Resources Department of the Canadian Pacific Railway, similar investigations being later carried on at Ronalane, where a tract of land, comprising some twenty-three acres was secured for the purpose. This station was later abandoned for a more desirable one near Vauxhall. A number of irrigation investigations were described by Mr. Snelson, the purpose of which, in each case, was to secure reliable data relative to:

First,—The amount of water required to produce the maximum yield of specific crops, when grown under different conditions of soil fertility.

Second,—The proper depth of water to apply per irrigation for the different crops.

Third,—The relationship between the irrigation head and the distance apart of the distributing ditches.

Fourth,—The seasonal water requirements of crops or the time of irrigation.

Mr. Snelson also dealt with the subjects of fertility, food elements cultural methods and rotations, and in speaking of the water requirements a number of charts were used to demonstrate his points. Charts were also used to demonstrate the facts and figures on growing irrigated oats.

As evidence of the practical benefit irrigators are receiving from the results of the investigations, Mr. Snelson cited one or two cases as illustrations, one of which was: A farmer complained to that although he had made a large serviceable ditches and had received a good head of water, he had harvested a poor crop and experienced considerable trouble in irrigating. Upon examination of his field, it was found that his field laterals were from 200 to 500 feet apart. Investigations have shown that for the ordinary irrigating head say two and three second feet, field laterals in ordinary loam soil should not be farther apart than 100 feet, especially in new fields, and the farmer was advised wherein he had erred.

Owing to the popular nature of the address, the meeting was open to the public. That the subject was generally felt to be of live interest was evidenced by the large turnout of Board of Trade members other than engineers. Considerable discussion followed the address, and the discussion was entered into at length by a number of men outside the profession.

Alberta Engineering Legislation

The act of the Alberta Legislature to regulate the engineering profession and to incorporate the association of professional engineers, assented to April 10, 1920, did not contain the clause which at the time seemed to the sponsors of the bill to be very essential. It did not provide that persons wishing to practise must be registered. In fact at the time it seemed that the only thing gained was the patent of a name, for the only thing really gained was the limitation as to who had the right to call himself a "Registered Professional Engineer".

However, since the passage of the original Bill, another came up to regulate the manner in which irrigation districts may form themselves into corporations and governing the procedure that such corporations must follow. In this act was specified that only a "Registered Professional Engineer" may be employed by such districts in a professional capacity. Again in an act passed at the last session of the legislature the highways act contained parallel provisions.

The question of definition of the word *engineer* has long vexed the profession. It was one of the things, undoubtedly, that prevented the original act from passing, with a clause in it regulating practise. It now appears that every step taken so far has led in the right direction and each step has been logical. The prestige of the engineer has been enhanced in the province; machinery is in operation for legal recognition of the profession, and the association formed pursuant to the act is strong in numbers, contains the best of those who call themselves engineers, and is on a good financial footing.

Ottawa Branch

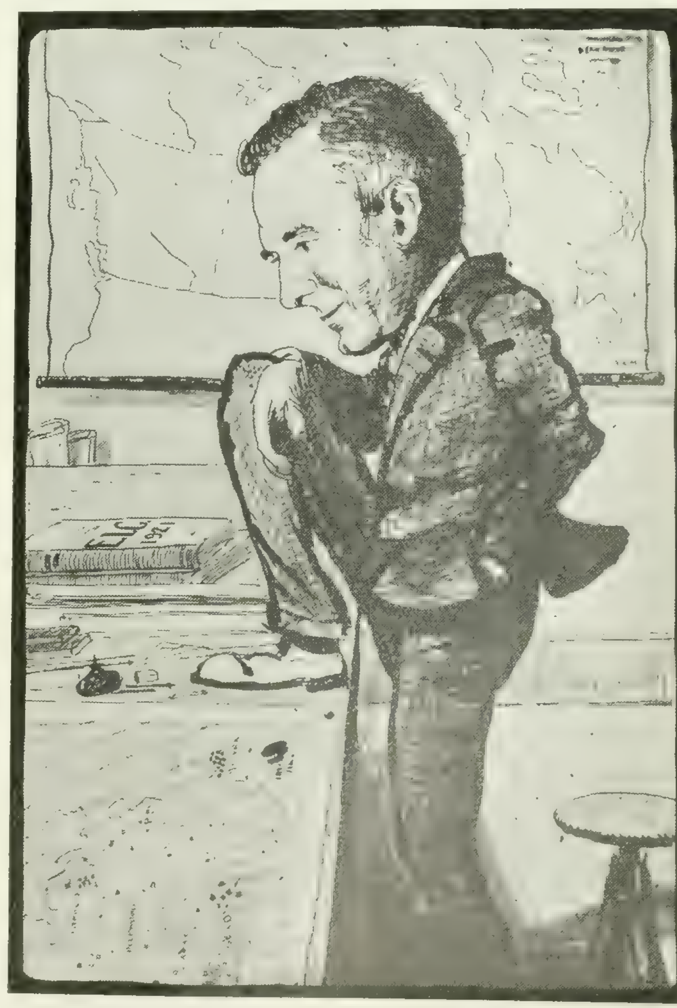
F. C. C. Lynch, A.E.I.C., Secretary-Treasurer.

World's Largest Single Power Development

The Ottawa Branch was told the story of the construction of the Chippawa power development on the evening of April 20th. The meeting was held in Victoria Museum, and the speaker was H. G. Acres, M.E.I.C., chief hydraulic engineer of the Ontario Hydro-Electric Power Commission and vice-presiden tof *The Engineering Institute of Canada.*

K. M. Cameron, M.E.I.C. chairman of the Ottawa branch, presided and introduced the lecturer as an old friend of twenty years standing. Mr. Acres had been intimately connected with the development of the work of the hydro-Electric Commission since its inception, and had played a large part in the investigation and subsequent development of the many water power developments of the Commission. The lecture was fully illustrated by lantern slides which admirably revealed the enormous task of the engineers, so successfully accomplished and without a single fatality, despite the use of some of the largest plant in the world. With a present capacity of 450,000 horse power, the plant was described as the world's largest. Although 5,600,000 pounds of dynamite, or six tons a day, were used in excavation of the canal channel, no accident happened.

The lecturer stated that three of the largest electrically operated shovels in the world were used for the work of excavating, and one of them was shown on the moving pictures dumping dirt at such a height that the lecturer said it would be equivalent to the shovel being on rails on Sparks street and lifting ten tons of dirt every 45 seconds to the top of the Hope building. The best record for one day's work was 8,600 yards of excavation. A dredger cutter which had been cutting at the rate of 6,000 cubic yards a day had its capacity increased to 10,000 yards a day by the simple device of welding a few teeth on to some of the blades. A cut 85 feet deep, at Lundy's Lane corner was another of the impressive features of the work illustrated by the pictures.



A "Bram-Wave" for the Annual Report.

Cement work of great magnitude was shown, and the lecturer said that fifteen cars of cement in twenty hours were put in last fall. The moving pictures revealed a car

load of sand and another car load of rock being dumped at the same time into hoppers for the making of concrete lining. Two huge penstock intakes were completed, and on testing showed not a single sign of leakage. The huge power house, 185 feet high, was indicated and its proportions brought home to the imagination by the statement that it would obliterate a view of the American falls at Niagara if placed in front. Over 4,830,000 yards of earth and over 2,750,000 yards of rock had to be excavated. Concrete lining at the rate of 2,500 yards a day was laid at an average of two feet thick, and on completion of the work it was found the concrete lining was a month ahead of schedule time. The aggregate weight of plant used was 5,000 tons, which was pulled out of the canal in five days. It included ten concrete plants and five shovels, which alone weighed 4,000 tons.

Mr. Acres, when showing one picture, said that it represented him standing at the foot of a column of water 450 feet weighing five million pounds and travelling at the rate of ten feet a second. Yet it could be brought to rest almost instantaneously. From Chippawa to Queenstown represented a drop of 315 feet.

At the close of the lecture, excellent moving pictures, produced by the Ontario Government Publicity Bureau, gave further illustrations of the magnitude of the task from many standpoints.

Annual Meeting of Canadian Geodetic Society

The fifth annual meeting of the Canadian Geodetic Society was held in Ottawa on the 18th of April, the president Mr. F. A. McDiarmid presiding. Officers elected for the ensuing year were; President, J. L. Rannie; Vice-president, A. M. Grant; Secretary-treasurer, H. G. Rhoades; members of council, J. B. Cannon, J. W. Menzies and F. P. Steers.

The retiring president complimented the society on the high standard maintained in the lectures and discussions during the year, and expressed the thanks of the society to Mr. F. H. Kitto, of the Natural Resources Intelligence Branch, and to Mr. W. C. Way, of the Surveys Laboratory who had delivered lectures during the season.

Edmonton Branch

R. H. Douglas, A.M.E.I.C., Secretary-Treasurer.

The regular monthly meeting of the Branch was held Wednesday April 19th, in the Edmonton Board of Trade Rooms. R. J. Gibb, M.E.I.C., of the city engineers department spoke on "Some Local Items of Municipal Engineering", introducing economies. He dealt briefly on the great difference to-day under which engineering is carried on as compared with ten years ago, and how it was only to be expected that these different conditions should show in the magnitude of public works, and to a lesser extent in quality. He illustrated the point by reference to the local trunk sewer system designed and constructed between 1910-1914, and the construction of the temporary walks in the city to-day, defending both as being justified under the conditions obtaining. He then spoke on the economic design of sewer systems for outlying districts dwelling particularly on the possibilities of the location of intercepters where a choice of location is possible. He also mentioned the tendency towards the construction of the separate sewer system, as against the combined system, due to the high construction costs, and high rates of interest. Mr. Gibb said that whereas such economy can be defended under present financial stress, we should aim to get back to normal working conditions as soon as possible. Mr. Gibb closed his paper by citing a few figures showing how little the city of Edmonton is spending today on maintenance work and operation as compared with the sums spent in the good old times, and hoped that this fact will be taken into consideration when people find condition not just in accordance with their idea of the fitness of things.

J. D. Robertson, A.M.E.I.C., Deputy Minister of Public Works of the Alberta Government gave a very interesting paper on "Road Building in Alberta", dealing with the various problems to be overcome in this province. He pointed out that in the settled portion of Alberta (not including the cities, towns, villages, and hamlets,) there are 166,000 miles of road allowance, 92,000 sections of land and 10,600 resident rate payers. The main highway system constructed and maintained by the Provincial Government covers 3,000 miles of road. The secondary system, or what might be termed main market roads, will total 7,000 miles. Having given the meeting the above facts Mr. Robertson proceeded to develop his subject, and in doing so gave much valuable and enlightening information.

In connection with the British Columbia Professional meeting to be held in Vancouver in June it was decided at the meeting to circularize the various Departmental heads in the Edmonton district pointing out to them the desirability and advantages in having their department as well represented as possible at this meeting.

Arising out of a paper by Clyde Sutherland, A.M.E.I.C., on "Local Concrete Materials," the Branch has appointed a committee of five to further examine our various concret materials, with the idea of arriving at the best combinations obtainable from them; the results and data arrived at to be made available for the Branch. The personnel of the committee appointed was, Clyde Sutherland, A.M.E.I.C., of the city engineer's office, (chairman); R. S. L. Wilson, A.M.E.I.C., of the University of Alberta; T. W. White, A.M.E.I.C., of the Canadian National Railways; S. R. Lamb, A.M.E.I.C., of the E. D. and B.C. Railways and D. W. Ritchie, A.M.E.I.C., of the Highways Branch, Alberta Government.

Quebec Branch

Hector. Cimon, A.M.E.I.C., Secretary-Treasurer.

Problems of the highways formed the central theme of an interesting address delivered on Wednesday evening, April 26th, in the Recorder's Court Room, City Hall, by Alex. Fraser, A.M.E.I.C., of the Provincial Highways Department. This lecture was followed by a remarkable speech on "The Practical Side of Scientific Concrete", by Colonel H. C. Boyden, of the Portland Cement Association, Chicago.

Quebec Highways.

Mr. Fraser dealt interestingly with the practical issues of the problem involved from a two-fold standpoint: (1), The standpoint of the financier and of economics; (2), that of the work itself.

The problem of economics was difficult enough: "I can give no better illustration of this fact," Mr. Fraser said, "than pointing out to the varied systems and laws governing highways throughout the United States and Canada. The differentiations of the laws arose doubtless in the first place from the differentiations in the systems employed, all of which arose very likely from the difference in point of view upon similar problems."

Despite these different points of view, however, and the different systems and laws resulting it was evident, said the speaker, that there was a very marked tendency in one direction. This was on the principle that each one should pay his share toward the expense of making and maintaining highways in proportion of the advantages received. There were the advantages which accrued to the individual and those to the community. The roads formed as a matter of fact a powerful influence upon the entire structure of economic progress of the province. It was evident that the improvements to the greatest highways gave the greatest benefits to the public, therefore the assistance rendered by the government toward the construction of the larger highways must necessarily be greater than upon the smaller ones. The contributions of the individual citizens would naturally be divided between expenses for the local and those for the greater highways. The provincial government would built the large highways and the responsibility for the smaller and local highways would fall upon the municipalities.

Hence one noted the need of classification of routing and of highways. This was in order to appropriate with justice the money required in this connection.

Mr. Fraser described briefly the highways system of Quebec. He finally exposed the chief factors involved in the technical work governing construction and concluded that the highways of Quebec were among the best of their kind to be found anywhere on the continent.

The speaker was warmly applauded by the audience.

Concrete.

Colonel H. C. Boyden, of the enginering staff of the Portland Cement Association, of Chicago, made a most noteworthy speech on "The Practical Sides of Scientific Concrete." Colonel Boyden was not unknown to the members of this branch, for all remembered the practical notes on recent developments in concrete, contributed by him last year. He took opportunity of the lecture of Mr. Fraser to make an historical survey of the highways in the United States. He then reviewed the principal parts of his last year's conference on concrete and he insisted specially on the importance of the water-ratio in the proportioning of ingredients and its influence on the strength of concrete. He also mentioned that in a near future, in construction projects, specifications for concrete will require concrete of a determined strength after a given time. Many questions were brought up to the speaker which have been answered very clearly to the entire satisfaction of all.

A. R. Decary, M.E.I.C., president of the Branch expressed the sentiment of all those present in warmly thanking Colonel Boyden and Mr. Fraser.

Water-powers.

At a luncheon at the Chateau Frontenac, on Monday, May 8th, a most valuable and entertaining paper was read by A. B. Normandin, A.M.E.I.C., who is connected with the Hydraulic Service of the Province of Quebec. Mr. Normandin dwelt upon the usage of water for domestic purposes, navigation and irrigation and incidently upon the value of irrigation in the Provinces of British Columbia and Alberta, in fertilization of the soil for agriculture. He touched upon the immense value of the innumerable Canadian cascades and water resources which give energy for the generation of electricity to satisfy all demands. He discussed at some length the progress made in the employment of the hydraulic resources in the Province of Quebec.

The speaker quoted some statistics giving the available amount of horse-power in Canada and in every province together with their respective amount of horsepower developed. He pointed out that the capital invested in Canada for the utilization of water-powers amounted to $500,000,000. which produced energy equal to 2,762,800 h.p. and a saving of expense in the outlay for steam coal equal to 20,500,000 tons. He also referred to the great benefits derived by industry and commerce from the utilization of water-power for energy and to the water legislation in the province of Quebec.

At the conclusion of the conference the president, Mr. Decary, in the name of the members, thanked Mr. Normandin and congratulated him on his paper.

Saskatchewan Branch

D. A. R. McCannell, A.M.E.I.C., Secretary-Treasurer.

The annual meeting of the Branch was held Tuesday afternoon March 7th, in the Council Chamber, City Hall, Regina.

The following officers were elected: Chairman, J. R. C. Macredie, M.E.I.C., Moose Jaw (Accl); Vice-Chairman, C. W. Dill, M.E.I.C., Regina; Secretary-Treasurer, D. A. R. McCannell, A.M.E.I.C., Regina, (Accl.); Executive Committee, (two years), R.N. Blackburn, M.E.I.C., Regina, Lieut-Col. A. C. Garner, M.E.I.C., Regina, A. P. Linton, A.M.E.I.C., Regina; Nominating Committee: H. R. Mackenzie, A.M.E.I.C., Regina, Convenor, W. A. Begg, A.M.E.I.C., Regina, P. C. Perry, A.M.E.I.C., Regina, Prof. A. R. Greig, M.E.I.C., Saskatoon, Prof. C. J. McKenzie, M.E.I.C., Saskatoon.

There was an interesting discussion in regard to ways and means to make the Branch of more value to non-resident members. It was decided to have at least three papers read before the Saskatoon members before the end of the calendar year and to hold the annual Summer meeting in Moose Jaw early in July. The possibility of furnishing outside member copies of papers upon application to the Branch secretary was also favourably considered.

The Executive committee at their first meeting appointed the following Standing committees: Welfare Committee, J. G. McVean, A.M.E.I.C., Convenor;

Legislation Committee, L. A. Thornton, M.E.I.C., Convenor; Papers and Library Committee, Lieut.-Col. A. C. Garner, M.E.I.C., Convenor; Quarters Committee, D. W. Houston, A.M.E.I.C., Convenor.

The Welfare committe replaces the Salary committee and is entrusted with all matters concerning the promotion of the welfare of the profession as ethics, education, status, protection of engineer's interests and consideration of activities in which the engineer should take an active part. The Papers and Library committee was enlarged and it was recommended that it be divided into three sub-committees, namely; Papers and Library, Publication and Publicity, Recreation and Entertainment. This has been done, and the three sub-convenors being respectively, Lieut-Col. A. E. Garner, M.E.I.C., D. W. Houston, A.M.E.I.C., and H. N. McPherson, A.M.E.I.C. The last named sub-committee has been active as subsequent regular meetings to provide entertainment features during the dinner and previous to the commencement of regular business.

The annual meeting was followed by the annual dinner at the Kitchener hotel from 6.15 p.m. to 8.00 p.m. and a theatre party at the Capitol theatre at 8.00 p.m Ovt-of-town members and ladies were invited as guests of the Regina members. Seventy-five members and friend attended.

On Thursday, March 23rd, a special meeting was held in the Saskatchewan Co-operative Creamery building where six short papers were read and discussed. This proved a very popular meeting. The speakers and subjects were as follows:—

C. H. Biddell, A.M.E.I.C.—"Some Notes on the Location and Construction of Roads by Municipalities".

W. E. Longworthy, Jr., M.E.I.C.—"Notes on the Design and Construction of a Humas Tank."

D. H. Lunam,—"Keeping Accounts."

H. N. Macpherson, A.M.E.I.C.—"Estimating for Construction Work."

T. McGuinness, A.M.E.I.C.—"Notes on Electrolysis Mitigation."

J. H. Puntin, A.M.E.I.C.—"Some Notes on Reinforced Concrete for Building Construction."

On Tuesday, April 18th the regular monthly meeting of the Branch was held at the Kitchener hotel preceded by a dinner at 6.30 p.m.

Lieut-Col. Garner, read a paper on "Saskatchewan and its Natural Resources." The subject matter of his paper was based on two trips made by him into the northern part of the province covering especially the district between Lac La Ronge and the eastern boundary. He pointed out that the proper development of this district would depend on the engineer as transportation and the utilization of the water-powers would be problems to contend with if the various mineral deposits were to be economically worked.

On Thursday May 4th the regular monthly meeting of the Branch was held at the Kitchener hotel preceded by dinner at 6.30 p.m. The Hon. Sam. Latta, Minister of Education and formerly Minister of Highways for the province was our guest and addressed the Branch on road-making and the Government's efforts to build up system of highways throughout the province. The Hon. J. G. Gardiner, present Minister of Highways and H. S. Carpenter, A.M.E.I.C., Deputy Minister of Highways, also spoke on the same subject.

All meetings this past year have been well attended and the discussions following the papers have been very keen showing a healthy interest in the subjects presented.

St. John Branch

Harry F. Bennett, A.M.E.I.C., Secretary-Treasurer.

The St. John Branch closed a very successful year on May 8th, when their annual meeting was held in the Clifton House, at the conclusion of a banquet in the dining hall. Before the business of the meeting was transacted, the chairman, Frank P. Vaughan, M.E.I.C., welcomed the members and their guests to the meeting and regretted that Mayor H. R. McLellan and others had found it impossible to attend.

In replying to the toast to the city of St. John, W. F. Burditt, president of the Board of Trade, expressed his pleasure at being present and dwelt further on the efforts which had been made to rectify the outstanding errors in the lay out of St. John. He had always looked to the engineers for assistance in Town Planning and hoped that they would always be willing to further any scheme for the betterment of the city. C. C. Kirby, M.E.I.C., responding to the toast to the Engineering Profession, urged co-operation and greater efforts to advance the interests of the profession and its members.

The special feature of the evening was an address by Lt.-Col. H. C. Boyden of the Portland Cement Association. He presented very instructive data on the later experiments in the manufacture of concrete and dwelt at length on the benefits accruing from following the system proposed by the Association. At the conclusion of the address numerous questions were asked and a general discussion took place relating to the various problems met in the making of concrete.

The general business of the meeting was then taken up. The membership committee reported considerable change in the membership during the year with a net result of a loss of four members. The employment committee reported a considerable number of applications for work and a portion of these had been assigned to temporary jobs. There were still several engineers unemployed.

The report of the Executive committee showed there had been seven regular meetings, two special meetings and seven visits to works of interest in and about the city during the past year. The finances of the Branch were in good condition with a net surplus of $107.22.

W. J. Johnston, A.M.E.I.C., and J. McM. Lamb, Jr.E.I.C., were appointed scrutineers and reported the election of the following officers:—Chairman, A. G. Tapley A.M.E.I.C.; Secretary-Treasurer, H. F. Bennett, A.M.E.I.C.; Executive Committee, F. G. Goodspeed, M.E.I.C., N. F. Nutter, A.M.E.I.C., G. H. Waring, A.M.E.I.C., (*ex-officio*) F.P. Vaughan, M.E.I.C., C.C. Kirby, M.E.I.C.

The following changes in the By-laws were approved:—

(1) To provide for a vice-chairman, elected annually.

(2) To provide for the filling of vacancies during the year in the Executive committee, by appointment by the Executive committee for the unexpired portion of the Branch year.

(3) To provide for the appointment of a Papers and Meetings committee and the detail of their duties.

Before leaving the chair, Mr. Vaughan thanked the members for their support during the year. He hoped that they would continue to work together and assist the executive in any way possible. He wished the incoming officers every success. Mr. Tapley then took the chair and thanked the members for the honour they bestowed upon him in his election to the chair of the Branch. Mr. Kirby then moved a vote of thanks to the retiring chairman for the very able manner in which he had performed his duties during his term of office, this was seconded by Mr. Bennett who said it had been a pleasure to act as secretary under the guidance of Mr. Vaughan.

The retiring chairman, Mr. Vaughan has since been honoured by the University of New Brunswick at its Encoenial exercises at Fredericton on May 17th, when he was given the degree of M.Sc. (honoris causa) in recognition of his services to the profession and to the university. Mr. Vaughan's many associates and friends extend their hearty congratulations.

The incoming chairman, Mr. Tapley, has been connected with the Dominion Public Works Department since 1909 and is at present assistant engineer in the St. John Harbour office. He was elected a student member of the Canadian Society of Civil Engineers in 1904 and an Associate Member in 1909. He has always taken an active interest in affairs pertaining to the profession.

Hamilton Branch

Opening of Burlington Canal Bascule Bridge.

The Strauss Trunnion Bascule bridge over Burlington channel was officially opened 12th May 1922.

The bridge is 160-foot span — 22-foot roadway — two 9-foot sidewalks — carries one radial railway track and is electrically operated with gasoline engine auxiliary.

Power for operation is obtained from an adjoining railway substation of the Dominion Power and Transmission Company a submarine cable being employed for crossing the channel.

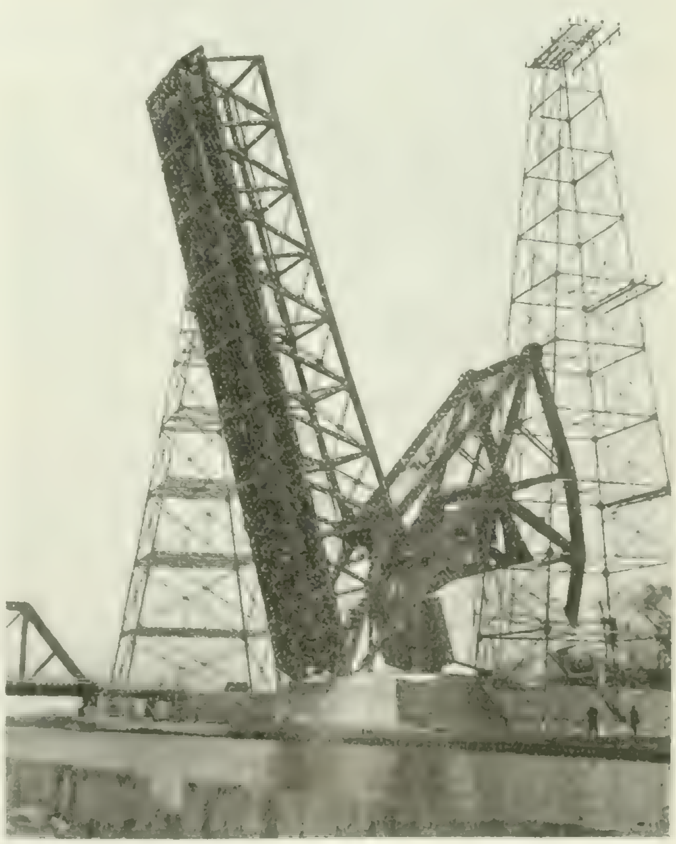
The main motors are, two 48-hp. 550-volt d.c., and are equipped with magnetic brakes: an emergency magnetic brake is also installed. The bridge when closed, is locked and the lock mechanism is operated by a 5-hp. 550-volt d.c. motor. The four roadway gates are also motor operated, ¼-h.p. motors being employed for this purpose.

The control equipment is of the semi-magnetic type and all control circuits are interlocked by means of limit witches and small magnetic contactors to prevent wrong operation; for example: it is impossible to unlock the bridge until the gates are lowered. All control equipment is concentrated on a small control desk at the window from which the operator has a view of road and channel. A mechanical indicator on the wall and illuminated signals on the desk enable the operator to see at a glance the exact position of the bridge at any moment.

A "dead man" foot switch is installed so that should the operator faint, all power would be automatically cut off and all brakes applied.

W. C. Brough, the general assistant engineer of the Department of Public Works, performed the opening ceremony by breaking a bottle, said to contain liquor, over the main trunnion. The cheering died down suddenly when the ancient odour failed to materialize.

The following were present: Dept. of Public Works — Lt.-Col. H. J. Lambe, M.E.I.C. superintending engineer. J. M. Wilson, M.E.I.C., district engineer. Designer — J. B. Strauss, M.E.I.C., Chicago. Harbour Commission — Capt. George Guy. Hydro Electric Power Commission of Ontario — T. U. Fairlie A.M.E.I.C. Hamilton Bridge Works (contractors for the superstructure) — Sir. Jno. S. Hendrie, W. B. Champ, R. K. Palmer, M.E.I.C., and staff. Contractor for the sub-structure — F. W. Paulin, A.M.E.I.C. Dominion Power and Transmission Company — Geo. Waller, superintendent Canadian Westinghouse — (electrical equipment) — George F. Foot.



Burlington Canal Bascule Bridge

The bridge successfully met every test devised by the Department's engineers and by Mr. Strauss who has designed some two hundred structures of this type. The bridge is shown in the accompanying photograph.

Joint Meesing with Ontario Association of Architects

The Branch had a joint meeting with the Hamilton Chapter of the Ontario Association of Architects, at a dinner in the Arcade, at 6.15 p.m. on Tuesday May 16th, 1922. Addresses were given by Mr. Fryer, chairman of the Architects and Mr. Darling for the engineers.

The desirability of co-operation between architects, engineers and contractors was emphasized and a joint meeting with the contractors was advocated. The meeting was enlivened by the singing of choruses and some very good solos were also rendered. About thirty sat down to dinner.

Town Planning Notes and Comments

Horace L. Seymour, A.M.E.I.C.

NOTE. — *In order to make this column of wide interest to members of The Institute, personals and items of town planning interest will be appreciated. Address: Horace L. Seymour, A.M.E.I.C., 40 Jarvis Street, Toronto.*

Third Annual Meeting of the Town Planning Institute of Canada.

"Town Planning may be defined as the scientific and orderly disposition of land and buildings in use and development with a view to obviating congestion and securing economic and social efficiency, health and well-being in urban and rural communities."

Such is the definition of Town Planning that appears in the bylaws of the Town Planning Institute of Canada as proposed in the Charter of Incorporation. Founded in 1919, with an active membership now of nearly 150, the need for incorporation is felt. A draft Charter of Incorporation has been prepared; it has just been approved at the third annual meeting of The Institute it will be submitted to all the members of the Town Planning Institute and will probably be made legal by letters patent, as no opposition to the incorporation is anticipated.

The programme of the third annual meeting was as follows:—

Friday May 12th. Afternoon session, council meeting, registration, and annual business meeting. Evening session, annual dinner, president's address, brief addresses by Mayor Plant of Ottawa; Hon. Rodolphe Lemieux, Speaker of the House of Commons; Senator George W. Fowler, Hon. Member, T.P.I. of C.; announcement of election of officers; and address by J. P. Hynes, A.M.E.I.C., chairman of the Ontario Town Planning and Housing Association, on "Where the Responsibility for Town Planning Belongs"

Saturday May 13th, Morning session, the following papers; Zoning, by Thomas Adams, past president T.P.I. of C.; The Suburban Problem, by W. E. Hobbs, A.M.E.I.C., director of Town Planning, Province of Manitoba; Town Planning Progress in Toronto, by T. D. Le May, city surveyor of Toronto. At the close of the meeting a round table luncheon was served.

The following corporate members of *The Engineering Institute of Canada* were present at one or more of the sessions:-- C. N. Shanly, J. Clark Keith, D. H. Nelles, Noulan Cauchon, H. L. Seymour, Jas. Ewing, N. B. MacRostie, N. J. Ogilvie, H. F. J. Lambart, R. C. Purser, W. H. Norrish, A. A. Dion and Jas. White.

The main item of interest at the business meeting was the discussion of the proposed Charter of Incorporation to which reference has already been made. The absence of Dr. Deville, the president, was keenly felt but he had been called away in the interest of science to Europe. Vice-president Noulan Cauchon, A.M.E.I.C., ably filled his place and gave a splendid review of the work of the Town Planning Institute, and of town planning progress in Canada. Mr. Cauchon has been of great service to the city of Ottawa during the past year as chairman of the Town Planning Commission.

A paper that aroused a great deal of interest and discussion was that entitled "Zoning" by Thomas Adams, past-president of the Town Planning Institute of Canada. Mr. Adams took the actual case of Welland, which is now engaged in the work of town planning. His talk was well illustrated with study maps. The principles of city planning were brought out in a practical way and the relation of zoning to city planning was emphasized. In conformity with the most approved practice in zoning, there has been advocated for Welland "use," "height", and "area", districts all with the same limits. Where such practice is possible it avoids confusion and makes it possible for these zones to be shown all on one map.

Mr. Adams also demonstrated the advisability of making fire limits coincide with use, height and area limits, proving it to be the only rational way for the determination of fire limits. The ability to enforce zoning bylaws under existing legislation was a matter of some discussion. It was felt that it would be a great advantage if some city, such as Welland, would bring the matter before the proper authorities as a test case. The discussion brought out the fact that according to Quebec legislation, cities can be and have been successfully zoned; Westmount and St. Lambert being given as examples.

Town planning education, as usual, was the subject of some discussion. The fact was brought out that severa universities in the States are preparing to grant towr planning degrees for post-graduate courses of two or three years. Some information received with loud applause was to the effect that J. P. Helme, a graduate of the Faculty of Applied Science, University of Toronto, anc a Student Member in the Town Planning Institute o Canada had been granted a scholarship enabling him to travel in Europe and observe town planning feature and points of interest. This scholarship was granted by the Ontario Department of Education through the effort of some of last year's Council of the Town Plannin Institute. A vote of thanks was tendered by the meetin to the Honourable R. H. Grant, Minister of Education

The following officers were elected for 1922: President J. P. Hynes, A.M.E.I.C., Toronto. Mr. Hynes is a prominent architect and president of the Ontario Town Planning and Housing Association. Vice-presidents, Jas Ewing, M.E.I.C., Montreal; W. A. Begg, A.M.E.I.C. Regina; Noulan Cauchon, A.M.E.I.C., Ottawa. Honorar secretary, Major D. H. Nelles, M.E.I.C., Ottawa. Hon orary librarian, W. D. Cromarty, Ottawa. Councillors H. L. Seymour, A.M.E.I.C., Toronto; H. B. Dunningtor Grubb, Toronto; Prof. Percy E. Nobbs, Montreal; W. F Burditt, St. John, N.B.; F. G. Todd, Montreal; Lieu Col. E. T. B. Gilmore, Ottawa; A. A. Dion, M.E.I.C Ottawa; Prof. A. A. Stoughton, Winnipeg; L. C. Charles worth, M.E.I.C., Edmonton; Prof. F. E. Buck, Vancouve

Report of Committee on Policy

Result of the deliberations of the Institute's Committee on Policy at Montreal, April 11th and 12th, as prepared by Chairman J. B. Challies, M.E.I.C., and Secretary A. B. Lambe, A.M.E.I.C. Received by Council May 22nd, and herewith published for the information of the entire membership.

Since the report of the committee on Society Affairs made five years ago, *The Institute* has witnessed a reorganization and rejuvenation far beyond the fondest hopes of the most optimistic of the committee's signatories. Membership and income have grown remarkably, credit balances have replaced annual deficits; and *The Journal*, the frequency and enthusiasm of meetings, annual, general professional and branch, new and virile Branches, increased esprit de corps, remarkable development of class consciousness, all combine to indicate that the committee on Society Affairs builded well and truly.

The increase within recent years in the prestige of the engineering profession is specially due and in generous measure to the service and the sacrifice so conspicuously rendered during the Great War by our members. The Honor Roll in the Main Hall at Headquarters bears eloquent and permanent tribute to one of the main reasons for our present fortunate position in the eyes of the public.

Such progress has resulted in a general desire for a stock-taking looking to a declaration of policy under which the efforts of *The Institute* can be guided in the future. The committee on Policy, therefore, is a natural and inevitable concomitant of the committee on Society Affairs. That committee had to do primarily with reorganization and only incidentally with policy. This committee is concerned more particularly with matters of policy and only incidentally with organization. It is in effect expected to advise Council respecting the appropriateness or otherwise of the objectives of *The Institute*, concerning its policy, and as to any resultant readjustment or reorganization.

The urge for the committee came primarily from the officers of the Ontario Provincial Division, who in their annual report for 1919, suggested the formation of a special committee on Development, to consider and report respecting the technical activities of *The Institute*; its internal relations and local associations; its relations with other national societies and related organizations; its relation to public affairs.

Subsequently the Council of *The Institute*, after a conference with the councillors and certain Branch and Division officers from Ontario, on April 27th, 1920, appointed the following committee on Policy with power to add to its numbers having regard to geographical location,—

J. B. Challies, Ottawa, (Chairman); Gen. C. H. Mitchell, Toronto; K. H. Smith, Halifax; J. G. Sullivan, Winnipeg; A. R. Decary, Quebec; F. H. Peters, Calgary; W. J. Francis, Montreal; A. E. Foreman, Vancouver.

The committee was authorized and instructed to prepare for the consideration of council a statement of the objects and policies of *The Institute*.

A progress report was made to Council in January, 1921, by the Chairman, after consultation by letter with the members of the committee, and was adopted by the annual meeting of *The Institute* held in Toronto on February 3rd, 1921. It appears in the Proceedings of that meeting.

In order to make the committee more representative geographically, Council in March 1921, reconstituted it as follows:—

J. B. Challies, Ottawa, (Chairman); Wills Maclachlan, Toronto; K. H. Smith, Halifax; Gen. C. H. Mitchell, Toronto; C. C. Kirby, St. John; R. O. Wynne-Roberts, Toronto; A. R. Decary, Quebec; J. G. Sullivan, Winnipeg; A. B. Normandin, Quebec; A. J. McPherson, Regina; W. J. Francis, Montreal; K. B. Thornton, Montreal; J. A. Duchastel, Montreal; F. H. Peters, Calgary; A. B. Lambe, Ottawa, (Secretary); A. E. Foreman, Vancouver; W. P. Wilgar, Kingston; W. G. Swan, Vancouver.

At the 1922 annual meeting of *The Institute* in Montreal, the Chairman made a brief, verbal progress report, when he explained the difficulty of composing by correspondence, the conflicting views of the members upon contentious matters under consideration. The annual meeting accepted the verbal report upon the understanding that a plenary meeting of the committee would be called shortly. This plenary meeting was held at Headquarters on April 11th and 12th, with sixteen of the eighteen members in attendance, Four sessions and two informal luncheon conferences afforded opportunities for thorough discussion. It is worthy of record that there was practical unanimity on all important decisions.

To facilitate the committee's work the following material has been prepared by its officers and is of record at Headquarters.—

(a) In May, 1921, a compendium of all available data pertinent to the committee's work and comprising about 150 pages of matter, including, for instance, copies of recent reports from similar committees of other engineering societies;

(b) Precedent to the plenary meeting, an agenda with full explanatory notes, comprising 30 pages of matter, and incorporating some original membership diagrams and summary statements respecting Council attendance and travelling expenses incident thereto;

(c) Complete proceedings of the plenary meeting, comprising 34 pages of closely typed matter, incorporating the formal resolutions and in general the discussions upon which they were based.

The following report of the committee on Policy was prepared from the above, but more particularly from items (b) and (c). It is submitted in its present form in order that the reasons for the committee's deliberations may be understood by, and it is hoped found acceptable to the

members of *The Institute* throughout the Dominion. At any rate the very full presentation herein of the committee's deliberations can form the basis of and facilitate such constructive action as is necessary to make *The Engineering Institute of Canada* a national body of professional engineers, properly constituted to serve the Dominion and the profession to the satisfaction of all classes of engineers in every part of Canada. "Reforms are effective in proportion to their timeliness." The unanimity of the committee is evidence of the timeliness of its conclusions. It is hoped that the general membership will substantially support these conclusions and furnish the requisite support to enable Council to have them implemented without delay.

In brief, the committee on Policy favours,—

(a) **A broadening of The Institute's stated objectives;**

(b) **More effective co-operation with sister bodies in Canada and the United States;**

(c) **A gradual verification of the status of The Institute as the one national, all-embracing, professional organization;**

(d) **Such internal economy changes as will strengthen the Branches and enable them to articulate more directly with the governing body, Council;**

(e) **The making of Council more continuously representative of those centres of Institute activity which do not, on account of distance from Headquarters, function directly;**

(f) **Mileage to Councillors upon a reasonable basis and within the available income of The Institute;**

(g) **More generous and general distribution of the high office of Vice-President, with concurrent extension of its usefulness;**

(h) **Recognition by The Institute of the basic importance of the engineering educational facilities of the Dominion to the future of both the country and the profession;**

(i) **Appropriate action to link up The Institute and its facilities with the students in Engineering in all Canadian institutions of learning;**

(j) **Suitable action to secure adequate academic recognition for the engineering profession comparable to that extended to the sister professions of law and medicine by the governing and degree-conferring bodies of our Canadian universities;**

(k) **An analysis of The Institute's Code of Ethics so that it may be more of a positive influence for a broader and a better professional consciousness;**

(l) **Positive action towards securing just and adequate remuneration for engineers, especially the younger members of the profession.**

Objectives of The Institute.

As a fundamental prerequisite to proper progress is a clear-cut, generally acceptable, comprehensive declaration of the basic purposes of *The Institute*, much time was spent in considering whether the "Objects" of *The Institute* as worded were apt or appropriate, having in mind the recent broadening of *The Institute's* membership, its remarkable increase in late years, and the urgent needs of its various geographical spheres of influence.

The following principal additions were proposed,—

To educate the public to the value of the engineer;

To encourage the study, development and conservation of the natural resources of the Dominion;

To encourage the establishment and maintenance of appropriate educational facilities, academic and otherwise, for the training of engineers.

After a very careful analysis of the above and the present Objectives of *The Institute*, as incorporated in Section 1 of its By-laws, it was unanimously agreed that the Objectives should be broadened and extended. It is accordingly recommended that the Objectives of *The Institute* be formulated as follows,—

(a) To develop and maintain high standards in the engineering profession.

(b) To facilitate the acquirement and the interchange of professional knowledge among its members.

(c) To promote the professional, the social and the economic welfare of its members, as may be deemed necessary for the maintenance of the honor and dignity of the profession.

(d) To enhance the usefulness of the profession to the public, to make known its value, and to indicate means whereby it may be of service.

(e) To encourage the establishment and the maintenance of appropriate educational facilities for the training of engineers.

(f) To promote intercourse between engineers and members of allied professions, and to co-operate with other societies in broadening the usefulness of the profession.

(g) To encourage original research, and the study, development, and conservation of the resources of the Dominion.

Exhibit D, attached, details the aims and objects of *The Institute* and of some of the other leading engineering societies of Great Britain and the United States.

Relationship of Institute to other Cognate Bodies in Canada and in the United States.

The committee is of the view that as in other countries, so in Canada, multiplicity of engineering organizations will not make for efficiency or effective results in efforts to advance the prestige and to promote the usefulness of the engineering profession. The experience of the kindred societies of Great Britain, the United States and of Australia in endeavours to secure conjoint and co-operative action by or on behalf of the engineering profession, indicates that one national, all-embracing, flexible, engineering organization, able to function for all

branches of the profession, whether in national, regional or local affairs, is the ultimate ideal to be achieved.

Leaders of the profession in the United States have been attempting to evolve such an organization by the federation of all the existing professional bodies. Because of traditional differences in policy, of cherished independence and conservatism, of strong sectional consciousness, of regional environment, and because of other limitations inherent in long established bodies, the federation idea in the United States has not proven the panacea for which its sponsors hoped.

So far as Canada is concerned, the same complex conditions do not exist, at any rate only to a very limited extent and regionally. There is but one established national, all-embracing, professional engineering society. There are other cognate societies of importance and promise, and some with both splendid traditions and unique accomplishments to their credit, but none are comparable with *The Institute* in breadth of professional scope, diversity and strength of membership, widespread geographical distribution, or as to flexible organization facilities. Some are organized primarily to advance an industry, as mining, chemistry, or forestry, and embrace a membership a very large proportion of which is neither professional nor engineering. Such bodies have a field of usefulness which should not conflict with the legitimate sphere of *The Engineering Institute of Canada.* On the contrary, the stronger and more progressive such bodies become and the better they function for their own purposes the greater will be the need for *The Institute.*

Still other organizations are of a regional nature, restricted to a particular branch of the profession and consequently limited both in membership and field of operation. These latter include the sections of two of the American Founder Societies which parallel, in most phases of their effort, the activities of the local Branches of *The Institute.*

Propinquity to the United States and its professional engineering practice makes it advantageous for many Canadian engineers to affiliate with one or more of the Founder Societies. A few Canadian engineers also find it advisable to join engineering Institutes of Great Britain and France. The reasons, however, which prompt affiliation with such outside bodies arise largely because of a desire for familiarity with special engineering endeavour abroad and for continuous contact with its best modern practice. Such causes are not incompatible with the privileges and responsibilities of membership in *The Institute.* Indeed affiliation with outside professional bodies should be complementary to and in no sense in conflict with or in substitution for membership in *The Institute.* While the desire for affiliation with outside engineering societies might with propriety be fostered among those Canadian engineers who require such connection, it should, in general, follow rather than precede membership in their national body. If the individual member of *The Institute,* as he progresses in his career, desires additional specialized advantages, he might well seek affiliation with a foreign professional body, but such affiliation should not be at the expense of his support to the national body.

The great bulk of the engineering profession in Canada, — civil, electrical, mechanical, mining, chemical, etc.,— actively supports and strengthens the efforts of the national body for advancing the prestige of the profession and for promoting its usefulness to the public. It should be the aim of *The Institute* not only to welcome into its ranks every worthy professional engineer in the Dominion, but to so mold *The Institute's* objectives, organization and activities that professional engineers of every class will desire membership therein.

The Enginering Institute, as the only national organization of a purely professional engineering nature in Canada, must inevitably occupy a position of leadership in all matters affecting the weal of the engineering profession in the Dominion. Great responsibility is therefore placed upon *The Institute.* It must be ready, willing and competent to function properly. If *The Institute* is functioning properly, it is not apparent why the establishment in the Dominion of further branches or sections of outside societies is advisable or necessary. At the same time, when such branches are established, the most cordial co-operation should be extended by *The Institute* whenever and wherever possible.

Leadership, not domination, is the logical role of *The Institute.* All activities to achieve the objectives of *The Institute,* whether directed by Council, Provincial Divisions, or Branches, should be premised upon a broad, generous and positive policy of co-operation with cognate societies. This is particularly advisable where opportunities are offered for collaboration with other engineering societies, or with Canadian sections of the American Founder Societies. Especially should frank, free and friendly co-operation be sought and maintained with the Canadian Institute of Mining and Metallurgy, a body with a long and honourable record on the pages of professional and industrial history in Canada.

Apart from a brief, general positive declaration of policy consistent with the above, and as an earnest of the fraternal good-will and sincere desire of *The Engineering Institute of Canada* for the general advantage of the engineering profession, the committee recommends that Council should take such steps both within *The Institute* and in relation to other engineering bodies in Canada and the United States, as will produce (a) a better understanding and more generous appreciation of each other's objectives and relative spheres of activity, and (b) friendly co-operation or united action in professional endeavour.

It was further unanimously recommended that Council prosecute through the committee on International Relationship or otherwise a policy of as intimate, friendly relationship and fraternal co-operation with the Founder Societies and others similarly constituted in the United States as conditions will permit.

Organization within The Institute.

So far as organization is concerned, the committee was of the opinion that the transition from the period of the Canadian Society of Civil Engineers provoked constitutional changes of an epochal nature. They have been largely devolutionary; the pendulum has swung from Council domination of all business and consequently of policy, to the present regime of "home rule" or self-determination of Branches and Provincial Divisions.

Council's time is now taken up almost exclusively with matters of general concern. There is now ample provision through Branches and Provincial Divisions for local freedom of action and initiative. Further devolution is not considered necessary or advisable. Too much devolution may mean ultimate disintegration. There is, however, need for betterment and changes in certain internal economy matters.

The committee therefore favoured the attachment of every member to a Branch, except that members non-resident in Canada should be automatically attached to Headquarters unless they elect to become Branch members and designate the Branch they desire to join, which right of election and designation should be conferred upon them. It was of course understood that such changes would not involve increases in fees to the present non-resident class of membership.

Membership Nomenclature.

The committee gave extended consideration to proposals for the simplification of membership grades and recommends,—

(a) That the name of the grade "Associate" be changed to "Affiliate" with the same qualifications as at present;

(b) That the names, qualifications and age limits of the other grades be left as they are;

(c) That both the entrance fee and the annual fees of the Associates of *The Institute* (Affiliates) be $10 instead of the present fees of $15 entrance and $13 annual.

(d) That the By-laws of *The Institute* be amended so as to provide that Juniors be given the right to vote in branch elections and to hold any Branch office with the exception of that of Chairman and Vice-Chairman, but that no change be made in the By-laws with regard to Associates.

Council—its Number and Representation.

The opinion was expressed that Council, as at present constituted, was too large; that representation by a definite working unit such as a Branch, instead of through the present inchoate, more or less arbitrary electoral districts, would make it a more effective body.

The committee is of the opinion that Council is too large a body and if reduced its efficiency would be increased and its expenses reduced. That Council is unduly large is very strikingly shown by a schedule, exhibit A, detailing the governing bodies and members of some fourteen engineering societies of Great Britain, Canada and the United States. An average of six of the more prominent shows that they have but one councillor for every 336 members and an average total Council of 27. *The Institute,* however, has a Councillor for every 81 of its membership and a total Council of 41. It would appear that *The Institute's* governing body might well be reconstituted and its membership reduced.

The matter of electoral districts was given consideration and the committee feels that the unit of representation should be the Branch. It is recognized that in certain cases this would be a fairly small unit. Especially would it be small in the case of some of the newer Branches. If every Branch were given representation the number of Councillors would not be reduced to any appreciable extent, and indeed the creation of new Branches would tend to continually enlarge the Council. Nevertheless it is the unanimous opinion of the committee that the Branch is, with suitable limitations as to smaller and newer Branches, the proper electoral unit.

The committee would stress the importance of according Branches a direct representation upon Council because it affords that more intimate connection between the governing body of *The Institute* and its main factors so necessary for progress. Furthermore, such action would be consistent with the tendency in recent years to afford Branches an ever-increasing measure of home rule, and consequently a greater voice in determining the policy and in guiding the activities of *The Institute.*

The committee recommends that Council take the necessary steps to ensure that all Branches be represented on Council.

Vice-Presidential Representation

The Constitution quite properly requires that there shall always be a Headquarters' Vice-President. At best this means that three of the four Vice-Presidents may be non-residents of Montreal. In practice, however, it quite often occurs, and it is so at the present time, that the Vice-Presidents are equally divided between Headquarters and outisde. Obviously this is not an equitable arrangement for the non-resident members,—two Vice-Presidents for a Headquarters corporate membership of 900 and two for a non-Headquarters corporate membership of 2,500.

If the Vice-Presidents were chosen as now, for a two-year term, but from residents of the major zones of *The Institute,* as for instance, the Maritime Provinces, the Province of Quebec, the Province of Ontario and the western provinces, there would be a more equal and acceptable apportionment of this high office. Such an arrangement would make for better geographical representation upon Council. They might be given the special duty, under the direction of the President and with the co-operation of the General Secretary, of visiting each Branch at least once a year. It should not be a difficult matter for a Vice-President of a zone to see that every Branch in his zone is visited at least once a year. Further exchange visits among Vice-Presidents for different zones would make for broader concepts of Institute objectives and policy, as well as a better understanding of its activities. The committee recommends that the number of Vice-Presidents be increased and that they be elected by their repective zones. Exhibit B, attached, shows in diagrammatic form a suggested re-arrangement of Vice-Presidential distribution that it is hoped will be acceptable to the membership.

Meetings of Council at Different Centres of Institute Activity

The present practice of holding practically all the meetings of Council at Headquarters is not conducive to a thorough understanding of certain local and sectional conditions which must inevitably have an important and in certain cases, dominant bearing upon the affairs of *The Institute,* as well as on the prestige of the whole profession

There is no constitutional impediment to Council holding meetings concurrent with general professional meetings. It might also be advantageous if Council held at the most suitable time once a year, what might be called "zone meetings." For instance, it should be possible for the President or a Vice-President, with the General Secretary, to convene a meeting in the Maritime Provinces of all Councillors within that zone; a similar meeting might be held in Ontario and in western Canada. Such zone meetings need not be plenary conferences of all members of Council, but the attendance of those members within geographical zones where they are held should be stressed and their expenses paid.

To prevent important decisions of general import to the profession and to *The Institute* being taken under what might be considered undue local influence and without proper general prospective, actions involving decisions at such zone meetings might be subject to subsequent ratification either by letter ballot, of all members, or at a regular Headquarters meeting.

A schedule, exhibit C, showing the attendance upon Council meetings for the past two years indicates the infrequency of adequate representation for a large majority of outside districts.

The committee, however, makes no specific pronouncement on the matter of Council meetings away from Headquarters, understanding that Council has the power to accommodate its place of meeting to the needs of *The Institute.* Furthermore, Council has upon occasion met at outside points, for instance, Toronto and Saskatchewan, and will doubtless be glad to do so again.

Mileage to Councillors

If Council is to be representative of the whole Dominion and able to function more effectively for all parts and classes of *The Institute* membership, something must be done to ensure a better attendance of outside members. Unless the attendance of far away councillors can be brought about, the growth and development of *The Institute's* activities outside of Montreal and the districts contiguous thereto (Ottawa and Quebec) must proceed without the advantage of Council's supervision.

Further, rivalry within recent years between Headquarters and outside membership of the governing bodies of certain of the Founder Societies of the United States has produced a situation which might, under conceivable circumstances, be paralleled within *The Institute*, unless the presence of more outside members of Council can be assured. Such assurance can be partially, if not absolutely, secured by *The Institute* agreeing to pay, within reasonable limitations, the expenses of its Councillors. One thing certain, the adoption of such a policy would disarm any criticism of the alleged control of Council by Headquarters and near-by members, even though, in the future, but a few additional outside members should find it possible to attend Council meetings.

To pay the travelling expenses of all members to every meeting would of course be the best possible arrangement, but this would involve an outlay obviously far beyond *The Institute's* powers. It should be possible however to pay the expenses of each Councillor to one meeting per year, which would involve an annual outlay of about $3,000.

The committee is unanimously of the opinion that contributions towards councillors' expenses, in whole or in part, is undoubtedly the next matter to which *The Institute* should devote any funds not otherwise appropriated. The committee recommends that for the present arrangements be made to pay the expenses of councillors to one Council meeting per year, and suggests that this be a plenary meeting.

Engineering Education and Student Activities.

Probably one of the most far-reaching and portentous matters considered by the committee was the fundamentally important question of the relationship of *The Institute* to the education of engineers to meet the needs of the Dominion, and how best *The Institute* could participate in student activities.

To-day the future engineer is an engineering student. Underlying the whole engineering structure lies the training of that student. What preparation should he have, what knowledge, what training, what vision, what purpose? How can he be taught, developed and inspired?

Two matters have been quite lost sight of by *The Institute* to date,—

(a) the fundamentally important question of appropriate educational facilities for those desiring to enter the engineering profession; and

(b) the relationship of the under-graduate student body to *The Institute.*

The individual engineer can expect only such public and private recognition and advancement as his training, education, fitness and personality may warrant. It behooves *The Institute*, therefore, to encourage the establishment and to assist in the maintenance of educational courses covering in addition to sound training in the sciences and fundamentals of diversified engineering, training in the human arts and sciences, including for example, political science, economics, history and general letters. Indeed the engineering profession cannot afford to be any less thoroughly qualified by education or otherwise than are the sister professions of law and medicine. Both of these professions have now collegiate courses ranging from six to seven years. It is not suggested that existing engineering courses should be extended. It might, however, be pointed out that every year sees the percentage of university trained engineers in practice increasing. If the bulk of our membership is to be of this class in the future, *The Institute* must forsake its attitude of laissez faire towards professional educational facilities, and assume some responsibility in shaping these courses to meet the changing needs of the times.

The generous recognition by the universities of McGill, Queen's and Toronto, in including engineers in their list of recipients of honorary degrees is both an evidence of the growing appreciation of the profession and an indication of the close relationship between higher education and the engineer.

For other faculties and professions there is a well-defined course leading to doctorate degrees. Why should there not be an appropriate degree in engineering compar-

ble to the LL.D., the Ph.D., the D.Sc., and the D. Ped. Would not the establishment of a degree "D.Eng." (Doctor of Engineering) to be conferred both *honoris causa* and *pro merito*, be a fitting academic recognition of the status of the engineering profession? Action necessary to have our universities establish such a degree might be considered and recommended by an Institute committee.

The diversity in university degrees in Applied Science and Engineering is a matter worthy of study by *The Institute*, also whether it would not be more appropriate if engineering rather than science were stressed in the nomenclature of these degrees.

Closely allied to the consideration of appropriate curricula for engineering education, is the question of the relationship of *The Institute* to its Student class. During recent years a remarkable interest has been engendered among the under-graduate bodies of our larger universities in *The Institute*. For instance, there are now about 200 Student members at the University of Toronto; 300 at McGill University, and 70 at Queen's University. This situation presents a problem to *The Institute* which demands its best consideration. As it involves basic issues of far-reaching importance, it should receive the continuous attention of a competent and specially chosen committee.

The future of the profession depends very largely upon the Student membership of *The Institute*. Engineering students cannot be too soon brought into intimate contact with the objects, the policy and the activities of *The Institute*. The American Founder Societies have achieved splendid results in furthering the interest of their Student members. *The Engineering Institute* can well profit by such experience. The committee therefore unanimously recommends the appointment of a special committee of Council to consider the matter of engineering education and student activities.

Code of Ethics.

The Code of Ethics of *The Institute* represents the policy or purpose which should actuate its individual members in their professional relationship to the public and toward one another. Inhibitions expressed therein are unfortunately violated and occasionally Council is called upon to act, or at any rate to make appropriate rulings in cases where violations are brought to its official attention. Rarely, however, is information respecting such cases made available to the general membership. The committee recommends that Council appoint a special committee to examine the Code of Ethics of *The Institute*, to compare it with those of other societies, and to recommend any changes it may think desirable, further, that such committee be authorized and instructed to confer with the various Branches in the course of its deliberations.

Financing of Provincial Divisions.

As no provision is made in the present Constitution for financing Provincial Divisions, the committee's opinion on the question was requested by Council.

The committee's conclusion is that the Provincial Division is an advantageous part of *The Institute's* organization, but as the activities thereof and the benefits therefrom must of necessity be confined very largely to a provincial territory, a share of *The Institute* funds as a whole should not as a regular and an accepted practice be assigned thereto.

The committee therefore could not see its way clear to recommend any change in the present procedure, viz., that Provincial Divisions obtain requisite funds either by assessing the members in their jurisdictions or through contributions from the Branches concerned.

Relationship of the Headquarters (Montreal) Branch to The Institute.

As there have been misunderstandings concerning the relationship of the Headquarters Branch to *The Institute*, especially among the far-away members, the committee devoted some time to the consideration of this question. It was represented to the Committee that the idea has been current at times that the Montreal Branch enjoys certain privileges not available to the rest of *The Institute*, and for which its members make no adequate return. After careful consideration the committee takes pleasure in reporting that this impression is not warranted and that as a matter of fact the debit balance is actually against *The Institute*, in that the Montreal members are not only devoting much time and thought to *The Institute* and its work but are in addition paying large extra fees. For instance, a statement laid before the committee showed that during the year 1921 *The Institute* received about $1,050.00 net from the Montreal membership over and above what it would have received from the same members if they had been paying the same fees as ordinary branch residents. If this be considered as a return for the use made of the Headquarters building by the Montreal Branch, it is obviously a large rental for any Branch to pay for its meeting rooms. In addition, there must always be remembered the work done year after year for *The Institute* by the Montreal Councillors.

The committee desires to record its appreciation of the fact that there are no undue advantages accruing to the Montreal Branch, financially or otherwise, by reason of its location at Headquarters.

Proposals for a Plenary Meeting Annually of Branch Secretaries.

This very important question was, by special reference from Council, considered by the committee. It was discussed at length, but on the whole the sense of the members of the committee was against such meetings. This decision was reached to a large degree because of the feeling that if there were matters requiring discussion by a body other than Council that the proper organization to handle them would be a special committee consisting either of representatives appointed specially by the Branches or else of the Branch Chairmen.

Another factor that influenced the committee was the universal feeling that the payment of councillors' expenses, in part or in whole, was the next matter to which any spare funds of *The Institute* should be devoted. Further, it was thought that if Council carried out the recommendation already made to arrange for Branch representation on Council that that would give Branches

somewhat greater facilities than at present for any needed inter-discussion of their respective problems.

It was generally admitted that secretaries' meetings would help towards the standardization of such matters as the keeping of Branch records, the handling of Branch correspondence, the procedure at meetings, etc., etc., but it was thought that as far as such standardization was advisable that it could be handled to advantage through the general office, either by correspondence or through the annual visits now being made by the General Secretary to each Branch. At the same time the meeting did not lose sight of the invaluable work being done for *The Institute* by Branch secretaries, and much appreciation for their activities was expressed. It was generally agreed that Branches should be urged to facilitate the attendance of their respective secretaries at every annual meeting.

In view of the decision of the committee to recommend that all Branches should be represented on Council, and also that the expenses of Councillors should be paid to one meeting per year, the committee is of the opinion that the idea of yearly plenary meetings of secretaries should not be endorsed. The committee, however, strongly recommends that attention of Branches be specifically called to the importance of the attendance of their secretaries at annual meetings.

Remuneration and Classification

This important question which has been occupying the attention of organized engineering bodies on this continent during recent years, has, the committee understands, been effectively dealt with as far as *The Institute* is concerned, by a special committee appointed by Council in March 1920.

The Policy committee is strongly of the view that this committee's report should be referred to every Branch Executive committee for study and report; that upon the receipt of their replies the special committee be requested to consider same and again report to Council; that then and before anything is made public, Council take appropriate steps to secure from sister engineering bodies in Canada their opinions of the committee's report and recommendations. After such bodies have been conferred with, but not before the committee's report should be published in *The Journal* for the general information of its members.

The committee on Policy is strongly in favour of *The Institute* doing everything possible to secure the promulgation, the adoption and the enforcement of adequate salary schedules.

Branch Resolutions upon Public Questions.

The committee has considered, by correspondence, the question referred to it as to the most desirable procedure with regard to resolutions passed by different Branches on matters of more than local interests, and after careful consideration of the various phases of the matter begs to say that, while quite recognizing the *right* of Branches to formulate and announce their individual opinions, and expressing the hope that Branches will continue to take into consideration the public engineering and allied questions that are current in their respective territories, the committee nevertheless is of the opinion that it is undesirable for Branch resolutions on matters of other than purely local interest to be made public before such resolutions be passed on to Council for its consideration, and Council's recommendation as to their public formulation be obtained.

This recommendation is based very largely on the fact that, notwithstanding that every care be taken to ensure that Branch opinions be published as such and not as Institute decisions, it is impossible to make the general public appreciate the distinction, and consequently it is but a very short time before each such opinion is quoted as and considered to be the opinion of *The Institute* as a whole. But in many instances the opinions of different Branches may be diametrically opposite to each other, with consequent endless chances for contradiction and confusion. From this it follows that it is obviously anything but good procedure that such opinions be publicly announced before submission to the collective consideration of the membership as represented by Council.

Further, the committee would also recommend that whether or no its above suggestion be approved of as to communicating with Council before the publication of Branch resolutions, that, in the case of resolutions intended for transmission to any government or governmental bureau, the practice be established of forwarding these always and only through Council.

In conclusion, the Policy committee desires to record its appreciation of the very great value of *The Journal* to *The Institute.* The committee would also record its appreciation for the advice and assistance rendered throughout its work by the General Secretary.

On behalf of the committee,

J. B. Challies,
Chairman.
A. B. Lambe,
Secretary.

EXHIBIT "D"

The Aims of the Leading Engineering Societies as Defined in their Constitutions or Bylaws.

1. **The Engineering Institute of Canada.**

The objects of this Institute shall be (a) to facilitate the acquirement and interchange of professional knowledge among its members, (b) to promote their professional interests, (c) to encourage original research, (d) to develop and maintain high standards in the engineering profession, and (e) to enhance the usefulness of the profession to the public.

2. **American Society of Civil Engineers.**

Its object shall be the advancement of engineering knowledge and practice and the maintenance of a high professional standard among its members.

3. **American Institute of Electrical Engineers.**

Its objects shall be the advancement of the theory and practice of Electrical Engineering and of the allied Arts and Sciences and the maintenance of a high professional standing among its members. Among the means to this end shall be the holding of meetings for the reading and discussion of professional papers and the publication of such papers, discussions and communications as may seem expedient.

4. **American Society of Mechanical Engineers.**

To promote the arts and sciences connected with engineering and mechanical construction.

5. **American Society of Mechanical Engineers, as Proposed in New Constitution.**

The objects of this Society are to promote the arts and sciences connected with engineering and mechanical construction, to promote intercourse among engineers and between them and allied technologists, and to co-operate with other societies in broadening the civic usefulness and advancing the standing of the engineering profession.

6. **American Institute of Mining and Metallurgical Engineers.**

That the American Institute of Mining Engineers is an unincorporated association organized and existing with the object of promoting the arts and sciences connected with the economic production of the useful minerals and metals and the welfare of those employed in these industries by means of meetings for social intercourse and the reading and discussion of professional papers, and to circulate by means of publications among its members and associates the information thus obtained.

7. **American Association of Engineers.**

The objects of the Association shall be to raise the standards of ethics of the engineering profession and to promote the economic and social welfare of engineers, especially by;

Affording means for the interchange of information beneficial to members of the engineering profession, maintaining a service clearing house for the benefit of members, influencing proposed legislation affecting the engineering profession and taking action necessary or advisable to safeguard the profession's welfare, promulgating the Association's ideas through proper publicity, and fostering a brotherly spirit among members.

8. **Western Society of Engineers.**

The object of this Society shall be the advancement of the science of engineering, and the best interests of the profession.

9. **Engineering Society of Western Penn.** No information.

10. **The Institution of Civil Engineers.**

Was first established, and has since been incorporated by Royal Charter, for the General Advancement of Mechanical Science, and more particularly for promoting the acquisition of that species of knowledge which constitutes the profession of a Civil Engineer; being the art of directing the great source of power in Nature for the use and convenience of man, as the means of production and of traffic in States both for external and internal trades, as applied in the construction of roads, bridges, aqueducts, canals, river navigation and docks, for internal intercourse and exchange; and in the construction of ports, harbours, molés, breakwaters and light-houses, and in the art of navigation by artificial power for the purposes of commerce; and in the construction and adaptation of machinery; and in the drainage of cities and towns.

11. **The Institution of Electrical Engineers.**

To promote the general advancement of Electrical and Telegraphic Science and its applications, and to facilitate the exchange of information and ideas on these subjects by means of meetings, exhibitions, publications, the establishment of libraries, the giving of financial assistance to inventors and experimenters, the provision of buildings for carrying on business of the Institution, and finally any lawful deed conducive to the attainment of its objects.

12. **Institution of Mechanical Engineers. (England).**

(a) To promote the science and practice of Mechanical Engineering and all branches of mechanical construction, and to give an impulse to inventions likely to be useful to the Members of the Institution and to the community at large.

(b) To enable Mechanical Engineers to meet and to correspond, and to facilitate the interchange of ideas respecting improvements in the various branches of mechanical science, and the publication and communication of information on such subjects.

(c) To acquire and dispose of property for the purpose aforesaid.

(d) To do all other things incidental or conducive to the attainment of the above objects or any of them.

13. **Institute of Chemistry.** No information.

14. **Institution of Engineers and Shipbuilders in Scotland.**

(2) To facilitate the exchange of information and ideas amongst its Members, to place on record the results of experience elicited in discussion, and to promote the advancement of science and practice in Engineering and Shipbuilding.

(3) The doing of all such other lawful things as are incidental or conducive to the attainment of the above objects.

CORRESPONDENCE

A Professional Card of 1846

Editor, *Journal:*—

Dear Sir:—

The following is a copy of an advertisement which I discovered in a Toronto newspaper (Examiner) of December 30th 1846. At that date railway construction had not commenced in Canada. It was the era of macadamized and toll roads. Companies were promoted and organized for the construction of roads, and many engineers and surveyors were employed. Railways were then in operation in Great Britain and companies were being promoted in Canada.

J. Ellis — Civil Engineer

"Horizontal, Inclined, and Undulating Lines of Railways surveyed, Macadamized and Plank Roads, Canals, Docks, Harbours; every description of Drainage, Tunnels and Bridges of Brick and Stone, Iron and Wood, both Pendant and Insistent, with Correct Specifications.

"Sections or Model Maps, and estimates showing the true cost of construction, founded upon Rules and principles strictly Mathematical, obtained through sixteen years experience and active practice, both as Engineer and Contractor.

"N.B.— J. E. will give detailed estimates if required to persons employing him, showing and proving that his calculations are founded upon true Principles, with Plans, Sections, or Model Maps, showing the true cubic measurements of Cuttings, Embankments, Grading and Side Drains, so simplified that almost any person may keep a correct check as the work proceeds upon the quantity of work done."

Peter street, Toronto.
Dec. 29-1846

If you consider the professional card of Mr. J. Ellis of sufficient interest, you might publish it in *The Journal.*

Sincerely yours,

WILLIS CHIPMAN, M.E.I.C.

Engineering in Southern Provinces, Nigeria

Eastern Railway Constr'n.
Enugu, Southern Provinces, Nigeria.
March 8th, 1922

Editor, *Journal:*—

Dear Sir:—

Reading Mr. G. B. Hull's letter in *The Journal* for December, reminded me of your unanswered letter. Curiously enough we are faced with closing down here for very similar reasons and some Europeans who proceeded on leave last month have had their contracts cancelled, ours will be also, we expect, as our leave comes due.

The work here, and especially the working conditions. has been very interesting, it was intended to continue the existing line (Port Harcourt—Enugu) northwards across the Benue river, linking up with the Lagos-Kano line at Kaduna. Enugu is the station for the Udi coalfields; supposed to be one of the largest known. It is soft coal and that near the surface is not of first quality though I understand the quality is expected to improve. The transport of this coal cheaply to Northern Nigeria and especially the mining areas of the Bauchi plateau is one of its objects and it is anticipated that these mines would be able to operate smelters on the property and reduce their present cost of production. It seems quite evident that construction work, for the present, will not proceed beyond the Benue and possibly stop before the Benue is reached.

Earthworks, bridges and culverts, and tracklaying are done under separate staffs. There are two points which seem of special interest to me, one in construction methods and one in administrative policy:—(a) Instead of abutments and wing walls the bridges on this work have "land spans", usually of 20 feet. I understand it is considered cheaper and the concrete work less complicated, (the latter is a great consideration where all labour, skilled and otherwise, is native and the best is very inferior workmanship). The slopes of the banks are "pitched" to above high water level. (b) Construction is carried out quite independently of the existing railway department, or "open lines", and I understand the chief construction engineer is appointed by and responsible to the governor of the Colony.

The working capacity of the native between Enugu and Northern Nigeria is small; I would judge the total average per man for the 40 miles from Enugu does not reach one yard per man per day, certainly not more than one. I have known of one or two causes where a gang, (25), has moved 75 yards in one day under the most favourable circumstances. It is all head work; shovels are used solely for filling headpans and one can see natives filling headpans to transfer earth a distance of 15 feet.

There is a scarcity of sand and stone and, at times, water. The water courses have not been extensively examined and, unless actually seen in flood, it is almost impossible to estimate its volume with accuracy. The rise and fall is so sudden that little, if any,.trace of H.W. mark is left afterwards and one might well see the same water course a number of times during the rainy season and yet not see it within 10 feet of its maximum flood level. I have seen a practically dry channel in the morning and the same afternoon seen a river 60 feet wide and from 5 to 10 feet deep in the centre.

It is not considered economical to carry more than four chains — all extra excavation from cuttings is wasted on the side and the banks made up from borrow pits. Banks are constructed from the bottom upwards in lifts of three feet.

I trust this will be of interest to you. It is only intended to convey a rough idea of the work.

Sincerely yours,

BERNARD H. HUGHES, JR. E.I.C.

Assistant Engineer

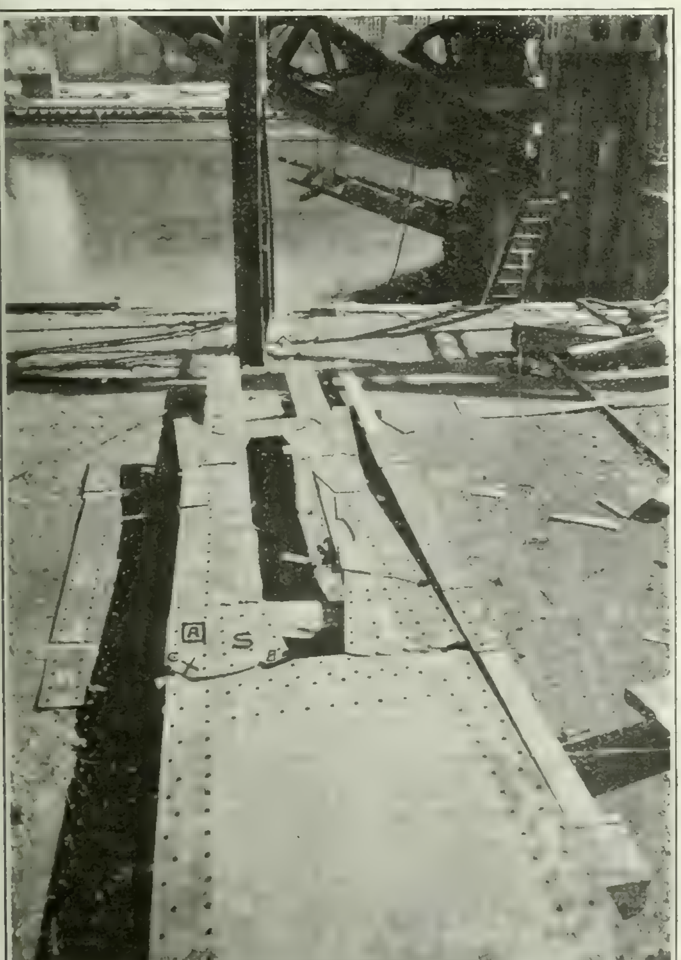
Investigation of Failure of Top Chord Covering Plate of Boom of Dredge "Industry"

Editor, *Journal*:— Ottawa, April 5th, 1922

Dear Sir:—

An interesting investigation has been carried out by the Laboratory for Testing Materials, Department of Public Works, Ottawa, with regard to the failure of the top chord covering plate at bottom end of the boom of the dredge "Industry", (No. 109), operating in the Georgian Bay district. This dredge was built and commissioned in 1906 and was in service until 1920 when the boom was dismantled and reconstructed because of the failure of this covering plate and other reinforcing members at the bottom end of the boom.

This three-eighth inch plate was used as a top reinforcement at the bottom end of the boom, it was fifteen feet eight inches in length and five feet three inches in width. It was riveted to the main longitudinal members of the boom and was reinforced around the aperture by reinforcing strips, these strips on the outer edges supported the pillow blocks for a seven and one half-foot idler which worked in the aperture. This idler supported the bucket cable and its peripheral speed would be about seventy-five feet per minute.



The chord covering Plate at bottom end of Boom, showing Fracture.

For investigation purposes the piece of plate marked "S-X" in the accompanying photograph, was sent to Ottawa. The edge along one fracture was considerably worn, while that of the other fracture was quite intact. The chemical analysis made in the laboratory from the borings taken from the plate at "A" (see photograph) was as follows:

Carbon	0.23%
Sulphur	0.09%
Phosphorous	0.053%
Manganese	0.41%
Chromium	0.13%

The tensile strength of the steel was obtained from two pieces cut from the inside of the plate. The results of this test as performed were as follows:

First Test	No. 1	No. 2
Yield point	61,319 lbs. per sq. in.	30,436 lbs per sq. in.
Ultimate strength	61,319 " "	51,906 " "
Strength at breaking point	45,693 " "	44,935 " "
Elongation, per cent	14.06	12.50

After Test	No. 1	No. 2
Reduction in area at point of fracture	51.44%	55.64%
Reduction in area at centre of sample	10.95%	5.10%
Reduction in area at end furthest from break	0.88%	25.10%

The results of the first test were unusual in that the yield point and ultimate strength were the same. No explanation can be given for this peculiarity.

As this laboratory is not equipped for making microscopic examination of metals, the Department of Mines consented to do this work and reported as follows:

"Specimens for microscopic examination were cut from the piece of the fractured plate sent to this office, at the points marked A. B. and C. Samples for analysis were taken from the place marked A by the Department of Public Works, and from the place marked C by the Mines Branch laboratories.

Chemical Analysis:—

Carbon	0.23%
Manganese	0.42%
Phosphorous	0.053%
Sulphur	0.067%

Microscopic examination:—

Three samples were taken for examination; sample A from inside of plate about three inches from the edge and samples B and C from the edge of the plate close to fracture.

Sample A shows the normal structure of a low carbon steel. The various constituents, pearlite and ferrite are well defined and evenly distributed.

Sample B has the same fracture as A but is faulty in that it contains small inclusions of non-ferrous material. There is also evidence of slip lines or fatigue, probably due to the vibration of the plate in use.

The structure of sample C is similar to B.

Fracture

Sample A shows a fine fibrous fracture. Sample B is coarse and crystalline, evidently due to fatigue as shown by microscopic examination. Samples A and B are quite different, in that A is tough while B is brittle.

There does not appear to be any microscopic reasons for seriously condemning this plate. The chemical analysis does show faulty material as the sulphur and phosphorous are too high for a first-class structural steel plate.

No microphotographs were taken as there was nothing striking or unusual observed in the polished sections examined".

In conclusion, it may be said that the purpose of this department, in investigating this failure, was to find out whether it was due to faulty design or from the fatigue of the material. From the foregoing report it is shown that the failure may be attributed to fatigue and chemical composition of steel. It may not be amiss to point out that fatigue of the metal must have been brought about at the points where the fractures developed by faulty design. It is very obvious that the design employed caused vibrations to be concentrated at certain nodal points which afterwards became lines of fracture.

Yours very truly,

E. VIENS, A.M.E.I.C.

Superintendent, Testing Laboratory,
Department of Public Works.

The Pavement of Sherbrooke Street, Montreal

Editor, *Journal:*—

Dear Sir:—

May I ask space in our *Journal* to call to the attention of our Municipal and Provincial Highway Engineering members throughout Canada, who may have an opportunity to visit Montreal in the near future, the present condition of the coarse mixture asphaltic concrete pavement wearing surface on Sherbrooke street, Montreal, east of McGill College avenue to Champlain street, and west to Atwater avenue. This pavement is also laid on some of the side streets between Sherbrooke street and Burnside Place, Metcalfe and Victoria streets for instance.

The purpose of this letter is to request my fellow members who are interested in street and road paving to inspect this pavement now, before it is extensively repaired or relaid, because later I wish to discuss with them professionally certain matters in connection with it, namely:

1. What is the real value of a five year guarantee on street paving; and should such guarantees be abandoned as comparatively useless and productive of a false impression of security?

It seems to me that Sherbrooke street proves such a guarantee of but little value and that the practice of depending upon such security should be abandoned.

2. Are lawyers who are not engineers, when appointed judges, able to render intelligent decisions upon engineering controversies?

It seems to me that the present condition of Sherbrooke street conclusively proves the contrary. Certainly no engineer specializing in paving matters, acting in a judicial capacity, would have been misled into forcing the city of Montreal to accept and make the final retained payment on Sherbrooke street.

There is something wrong somewhere when a city is compelled to accept and pay for an asphaltic concrete pavement wearing surface, the formula for the mixture of which was under the technical control of the contractor, despite the fact that every driver of an automobile in Montreal knows what its record has been and that it has been a failure as a pavement wearing surface from the first; and I wish my fellow engineers to see for themselves now so that later discussion may be better conducted.

Yours very truly,

CHARLES A. MULLEN, M.E.I.C., M.A.S.C.E.,

Consulting Paving Engineer and
Director of Paving Department—
Milton Hersey Company Limited

Canada's Forest Experiment Stations

The field work on the Dominion Forestry Branch forest experiment stations is being vigorously pushed this season. There are two permanent stations, one on the Petawawa Military Reserve in the white pine region of Ontario, the other at Lake Edward in the pulp lands of Quebec, on the Laurentide Company's holdings. The main object of the work is to discover the proper means of securing a continuous crop of timber on cut-over lands, and of putting lands at present unproductive on a productive basis. The two experiment stations form the nucleus of the Dominion forest research organization. This organization embraces work on the Dominion forest reserves in the West and similar work in various parts of the East; the latter in co-operation with lumbermen and pulp companies, who, in common with provincial foresters and many others, are lending their enthusiastic assistance to the work.

Trade Publications

Built to endure. Koehring Company of Milwaukee, Wisconsin, have recently issued a very attractive and beautifully illustrated booklet containing "Comparative examples of notable ancient and modern construction, embodying the element of permanency," prepared by Philip Koehring.

The subject matter is arranged so as to compare works of the past ages with the more modern engineering achievements and in connection with each description interesting historical and technical data are given. Some of the ancient works described are "The Acropoles at Athens; The Colosseum at Rome; The Roman Viaduct at Nimes; The Bridge of the Seine; The Appian Way; while those of our own day include, "The Bush Terminals; The Stadium of the New York Yankees; The Tunkhannock Viaduct; Hell's Gate Bridge; The Lincoln Highway, and The Elephant Butte Dam".

In the "Foreword" of the booklet is expressed the thought which must surely occur in the consideration of such a comparison of works, "Modern science and industry have added new discoveries to these age old secrets, producing synthetic stone more enduring and permanent and a more pliant and ready servant of the architect and builder. The men who have made possible these achievements in concrete are entitled to the honour credit and glory of enlarging, preserving and perpetuating, the wonderful civilization which we are now enjoying".

Preliminary Notice

of Applications for Admission and for Transfer

19th May, 1922

The By-laws now provide that the Council of the Institute shal approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in June, 1922.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option, Railway, Municipal Hydraulic, Mechanical, Mining or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects, Geography, History (that of Canada in particular), Arithmetic, Geometry, Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits scientific acquirements or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BABCOCK—HAROLD AUSTIN, of 40 Orchard View Blvd., Toronto, Ont. Born at Oshawa, Ont., July 8th, 1894; Educ., B.A.Sc. Univ of Toronto, 1917; 1914, surveying, Gibson & Gibson; 1916, inspr. of paving, Dept. of Works, Toronto; 1917, Dominion Bridge Co.; 1918-20, design of hydraulic structures, H.E.P.C. of Ont., Toronto; 1920 to date, with James, Proctor & Redfern, Toronto, Ont.

FOR TRANSFER FROM CLASS OF JUNIOR TO HIGHER GRADE

BEAUDOIN—HORACE, of Hawkesbury, Ont. Born at Montreal, Que., Oct. 4th 1892; Educ., 1909-11, Ecole Polytechnique, Montreal; 1910 (summer) rodman on transmission line constrn., Shawinigan Water Power Co.; 1911 (summer) and from Nov. to June '12, transitman on surveys, Boucher & Demers, Montreal; 1912-13, instr'man and dftsman. on municipal improvements for City of Maisonneuve; 1913-14, chf. of party on land surveys with F. C. Laberge, Montreal; 1914 (Apr.-Aug.) asst. to city engr. in chg., surveys for City of Maisonneuve; 1914-16 on active service overseas and in Canada; 1916-17, chf. of party on topogr. survey for power development on St. Francis River, Que., under M. D. Barclay, Montreal; 1917-18, asst. engr. to E. Drinkwater, Town Engr., Montreal,; 1918 to date chg. of design and supervision of constrn. of water wks., sewers, highway bridges etc., with V. E. A. Belanger, consltg. engr., Hawkesbury, Ont.

References: V. E. A. Belanger, F. C. Laberge, M. D. Barclay, C. B. Bate, A. G. L. McNaughton, J. E. Bertrand.

FOR TRANSFER FROM CLASS OF STUDENT TO HIGHER GRADE

AFFLECK—JOHN KNOX of 2, Spadina Rd., Toronto, Ont. Born at Perth, Ont., June 3rd, 1894; Educ., B.A.Sc., Univ. of Tor., 1921. 1913 surveying, Green Bros. Burden and Co., B.C.; layout work Canadian Explosives, Nobel, Ont.; 1915 (May to Sept.)Internat. Nickel Co., Copper Cliff, Ont.; Dec. 1916-Feb. 1919, works chemist Ministry of Munitions of War Dept. of Explosives Supply, Gretna, Scotland; Mar.-Oct. 1919work on reverberatory furnace and in Laboratory; 1920 (May-Oct.) works chem. Standard Chemical Co., Montreal. At present works chem. Imper. Varnish and Color Co., Toronto, in dry color dept.

References: P. Gillespie, C. R. Young, H. E. T. Haultain, J. R. Cockburn, G. Affleck.

BISHOP—TRENHOLME ALLEN GILL, of 9 Summerhill Ave., Montreal, Que. Born at Montreal, January 1st 1897; Educ., B.Sc. (E.E.) McGill Univ. 1921; 1916 (summer) shell shop etc., Steel Co. of Canada; 1917-19 Lieut. R.F.C. and R.A.F.; 1920 (summer) elec. mtce. dept., Northern Electric Co.; 1921 to date engr. engr'g. dept., Montreal Public Service Corpn., Montreal.

References: K. B. Thornton, W. H. Breithaupt, L. A. Herdt, F. B. Brown, L. H. Marrotte, C. M. McKergow, C. V. Christie.

BOWMAN—NELSON, of 31 Mill St. Montreal. Born at Ayr. Ont. Dec. 29th, 1894; Educ., B.A.Sc. (civil) Univ. of Toronto, 1921; 1918 (June-Nov.) Canadian Aeroplanes, Toronto; 1918-19 (Nov.-July) Dominion Tire Factory, Kitchener, Ont.; 1919 (July-Oct.) and 1920 (April-July) Ames Holden Tire Factory, Kitchener; 1920 (July-Nov.) had complete charge of design and erection of 3 storey warehouse of concrete beam and girder type and 1921 (April to the present) complete charge of design and erection of a concrete grain elevator and workhouse with Dominion Linseed Oil Co., Baden, Ont.

References: P. Gillespie, C. R. Young, W. J. Smither, S. G. Talman, W. D. Walcott.

DICK—VICTOR WILLIAM, of 50 Bristol Str., Hamilton, Ont. Born at Winnipeg, Man., June 12th, 1897; Educ., B.Sc. (E.E.) Univ. of Manitoba, 1921; 1920 (summer) dftsman., Winnipeg City Hydro; 1921-22 (June-April) test course, Canadian Westinghouse Co., Hamilton; at present correspondent, detail division, Correspondence dept., Canadian Westinghouse Co., Sales dept.

References: E. P. Fetherstonhaugh, J. N. Finlayson, E. V. Caton, W. F. McLaren, J. W. Dorsey, D. L. McLean.

McLENNAN—LOGAN SEAFORTH, of 2560, 1st Ave., W., Vancouver, B.C. Born at Vancouver, Jan. 7th, 1900; Educ., B.Sc., McGill Univ., 1922; two summers employed with pulp and paper at Powell River, B.C.

Some Legal Aspects of Engineering Contracts

A Memorandum of the Law relating to Contracts for Engineering Works.

Alfred Bicknell.

Paper read before the Toronto Branch, The Engineering Institute of Canada, April 6th, 1922.

Lawyers

Lawyers, the most trusted and distrusted; the men who make contracts and unmake them; who give advice and sell counsel; who make money out of trouble and make trouble out of money; who create estates and distribute them, legally; who live by loaning money, and often subsist on borrowed capital; who hear and conceal marriage secrets, and drag out faded letters in bitter divorces; who please and persuade when they are lucky, but often go out of court branded and dispraised by the side defeated, and with one side always the loser, — what wonder that the slurs of character fall to the common lot of the lawyer!

Without the smiles of the merchant's customer, he meets the frowns of business men in trouble. No time is to be lost, no delay for fees. He must win a victory or bear the blame forever. Unlike the builder, who knows that be it ever so perfect, the elaborate house he has finished can never suit the proprietor; unlike the machinist, he controls not his own enginery; carrying the double burden of care for self and client, invited to win what others have failed in; urged to mend the broken pieces of an ill-made contract; bound to account for unreasonable confessions, blunders, and letters; asked to replevin goods already secreted, to attach the effects of a malicious merchant, to unearth fraudulent elections, to reclaim vast estates from costly tax titles, to keep one for years in plenty by restored possession and broken wills, often on doubtful evidence by a lawyer's art and eloquence, — what a happy condition!

Fated from the start by uncertainty, where clients exact no less than absolute victory, they long to call reasonable what they know is only probable. By logic and argument on the theory of their client, with the facts only partially stated, and that part deeply shaded, they are often surprised by the other side and called to explain away their defeat in the end by a tirade on the

perjury of witnesses and the depravity of human nature. The happy lawyers! The men who live so easily, flourish so long on the bounty of a grateful people, make the laws and settle the titles, defend the weak and protect the wealthy, enjoy the rich fruit of the world's praises and abuses, mingled and commingled in such rare harmony that none can define where censure ends and approval commences, — who would not be a lawyer!

Law

What is known as "Law", is a set or rather sets of rules and regulations intended to govern the proper conduct and carrying on of the affairs of life. These rules and regulations are the product of ages and some are founded upon the Law of Moses; certain principles are laid down in what is known as the "Common Law" and others are set forth in Legislative Enactments, called "Statutes". The latter may merely declare what is or has been the Law or may make entirely new regulations for the conduct or carrying on of certain transactions.

Legislative bodies in these times seem to feel that the people may consider they are not diligent unless the Legislature enacts each session a large number of new Statutes, whereas it should be a cardinal principle of every Legislature to make as few changes as possible in the existing state of affairs and every amendment made should be of such importance that it would not involve too much expense to reprint the Act as amended, instead of inserting a few amending words here and there throughout the Act. If such were done business men would not have such a laborious task to ascertain what is the existing Statute Law on a particular subject. Legislatures throughout the country and, in fact throughout the whole world, should endeavour to have uniform codes of laws. As matters exist at the present time what is Statute Law in one Province of a Dominion, may be entirely different in another Province, notwithstanding it is only a few yards across the border line. A commencement has been made along this line, but it reminds us of a story of Artemus Ward, where he refers to a railway having been built across the continent, "— it is seven miles in length but it breaks the monotony of the journey".

There are very few codifications of the laws; such as the Bills of Exchange Act, the Criminal Code, Sales of Goods Act, and the Partnership Act. It would be a very difficult matter to codify the law relating to building and engineering works and it seems to be difficult to work out a satisfactory form of contract for these purposes, although the matter is now and has been under way for some few years, but this will be referred to a little later.

Contracts for Building and Engineering Works

The peculiarity of contracts for building and engineering works arises:

(a) From the building owner not knowing accurately what he wants and the consequence and necessity of employing a person of skill to prescribe for him by means of plans and specifications that which he cannot prescribe for himself;

(b) From the building owner not knowing, when the work is prescribed, whether it is what he really wants because of his inability to understand plans and drawings and the technical meaning of specifications. This ignorance of technicalities is a fertile cause of variations and extras after the contract is signed;

(c) From the building owner not knowing, when the work is done, whether the work prescribed in the plans and specifications has been performed satisfactorily or the proper workmanship and materials employed;

(d) From the builder or contractor, for the purposes of his tender, being in the habit of relying entirely upon the plans and specifications of the architect or engineer of the employer, without examining them particularly for himself;

(e) From the plans and specifications frequently omitting sufficient detailed description or from the plans being sometimes impracticable;

(f) From their immense detail and the many and varied risks and contingencies to which the performance of building contracts is subject;

(g) From the great expense attendant upon obtaining estimates for the work;

(h) From the fact that the architect or engineer employed by the building owner is often, by the terms of building and engineering contracts, placed in the peculiar position of valuer between the parties and impartial decider of all questions arising out of the complications of building operations, while at the same time for some purposes he is agent of the building owner.

Perhaps the most peculiar feature of building and engineering contracts is that no acceptance or approval of work can be implied from the employer being in possession of the property on which the work is done. If the builder does not do that which he contracts to do he cannot recover, although the work done be as good as, or better than, that specified; nor can the builder, although he has not been paid, take away that which he has built on the property of the owner, for as soon as the materials are attached to the soil they become part of the realty and even if pulled down they still remain the property of the employer.

In addition to these peculiarities, engineering and building contracts are often composed of conditions of various kinds which seem to have been handed down for years, put together by the engineer or architect in various combinations and producing various legal results of more beneficial interest to the lawyer than to the parties concerned. Even where the precaution is taken of having the contract settled by a lawyer, he is frequently only asked to settle the contract and not the conditions of the contract, which are the all important parts, and even when both the contract and conditions are settled by a lawyer they are only too often then attached to specifications prepared by the architect, containing other conditions which are not consistent with the contract and conditions so settled.

It will therefore be seen that it is very important for architects, engineers and building contractors to endeavour to settle on some satisfactory form or forms of building contracts; one being a straight lump-sum contract and another a cost-plus-percentage contract.

Essential Features of a Contract

A few points in connection with the making of contracts generally will be taken up first. The writer has found, from experience, that the want of a correct knowledge on this matter is the cause of a very great deal of the litigation that finds its way into the courts of the country and from time to time it has been found necessary to endeavour to expound the more important features of a contract.

The object of law is "order", and the result of order is that men are enabled to look ahead with some sort of security as to the future. Although human action cannot be reduced to the uniformities of nature, men have yet endeavoured to reproduce by law something approaching to this uniformity. As the law relating to property had its origin in the attempt to ensure that what a man has lawfully acquired he shall retain, so the law of contract is intended to insure that what a man has been led to expect shall come to pass; that what has been promised to him shall be performed.

Agreement is the expression by two or more persons of a common intention to affect their legal relations. An essential feature of a contract is a *promise* by one party to another, or by two parties to one another, to do or forbear from doing certain specified acts. By a promise is meant an accepted offer as opposed to an offer of a promise. An offer must be distinguished from a statement of intention; for an offer imports a willingness to be bound to the party to whom it is made.

Thus, if A says to X, "I mean to sell one of my sheep if I can get $25.00 for it", this is a mere statement which does not admit of being turned into an agreement; but if A says to X, "I will sell you whichever of my sheep you like to take for $25.00," we have an offer. An offer becomes a promise by acceptance; until acceptance it may be withdrawn; after acceptance its character is changed. If A says to X, "I will sell you my sheep for $25.00," and X says, "I will buy it for that sum," there is a promise by A to sell, and a promise by X to buy, and a contract between the two. To make that sort of agreement which results in contract, there must be, (1) an offer, (2) an acceptance of that offer, resulting in a promise, and (3) the Law must attach a binding force to the promise so as to invest it with the character of a legal obligation.

Every expression of a common intention arrived at by two or more parties is ultimately reducible to question and answer. If X says to A, "Will you give me $5,000. for my house?" and A replies, "I will," a contract is made; but if A says, "I will if you will put a new verandah on the front," there is no acceptance until X agrees to A's terms. The acceptance must be of the terms offered or the matter remains open and no contract is made.

A offered to sell a farm to X for $5,000. X said he would give $4,500. A refused and X then said he would give $5,000., but A declined to adhere to his original offer and no contract resulted, the Court saying the counter offer of $4,500. was a refusal of the first offer.

X telegraphed to A, "Will you sell us Bumper Hall Pen? Telegraph lowest cash price, answer paid". A replied by wire, "Lowest price for Bumper Hall Pen, £900". X telegraphed, "We agree to buy Bumper Hall Pen. for £900 asked by you". The Court said no contract was made, that A in stating the lowest price which he would take was not accepting an offer but supplying information, that the third of the telegrams set out above was an offer by X — not the less so because he called it an acceptance — and that this offer had never been accepted by A.

A offered $1,450. for a property belonging to X. In accepting the offer X enclosed with the letter of acceptance a contract for signature by A. This document contained various terms as to payment of deposit, date of completion and requirements of title, which had never been suggested in the offer. There was no contract; the Court said it would be equally unfair to hold A to the terms of acceptance and X to those of the offer.

Where an offer to sell property was accepted, "Subject to the terms of a contract being arranged," between the solicitors of the parties, no contract was made. The acceptance was not, in fact, more than an expression of willingness to treat. An offer need not be made to an ascertained person, but no contract can arise until it has been accepted by an ascertained person. The proposition is best understood by an illustration: The offer, by way of advertisement, of a reward for the rendering of certain services, addressed to the public at large, becomes a contract to pay the reward so soon as one individual accepts the offer by rendering the services, but not before.

B wrote D, "Please give us your lowest quotation for 3,000 yards of canvas to the enclosed sample". D replied, "We enclose sample nearest we have to yours, lowest price 1—5/8 d. per yard. B then wrote D, "Get made for us 3,000 yards as per your quotation". Held: D's letter was not an offer to sell but merely a quotation of terms on which B might offer an order and there was no contract made by the correspondence; *Bayers vs Duke — (1905) 2 Ir. R. 617.*

A mere advertisement announcing that it is intended to hold an auction sale, constitutes no contract between the advertiser and the highest bidder that the goods shall be sold to him, nor between the advertiser and any intending purchaser that the goods shall be put up for sale at all; *Harris vs Nickerson — L.R. 8 Q.B. 286.*

In a late case in the Supreme Court of Canada decided on June 27th 1921, between the Halifax Graving Dock Company and His Majesty, the King, the same question came up and, in fact, the question is arising so frequently that I consider it is one of the most important things for a business man, especially architects, engineers and contractors, to understand, as they are dealing with all sorts and conditions of men in practically every walk in life.

The facts of the Halifax Graving Dock case are as follows. — The Halifax graving dock and plant were wrecked by the explosion in Halifax in 1917 and in January 1918, the Government of Canada passed an Order-in-Council providing that the contract for repairing and re-constructing it should be entrusted to the Halifax Graving Dock Company, on condition, among others, that the latter should contribute $111,000, the amount of the insurance it carried, and the Government pay the

balance. A letter was sent to the company enclosing a copy of the Order-in-Council and stating that, "an agreement is being prepared and will be submitted to you shortly for your signature," but no agreement was ever executed. Two days later the company wrote the following letter:

> "We beg to acknowledge receipts of yours of the 17th instant enclosing a copy of Order-in-Council with reference to the construction of the Halifax dry dock, which is satisfactory, but in order that all will be quite clear our understanding is that we are to assign our insurance policies to the Government and that the temporary buildings now being constructed are to be replaced by permanent buildings of the same kind as the original."

The company did some work on the dock, but the Minister was not satisfied with its progress and the Government took it over, practically completed it and finally expropriated the property. In proceedings by the company to recover the amount expended on the work, the Court held that the above letter did not contain *an unqualified acceptance of the terms set out in the Order-in-Council;* that there never was a *concensus ad idem* between the parties; Mr. Justice Iddington stating with reference to the letter: "I am unable to hold that the letter was a clear and unconditional acceptance of the offer made by the Order-in-Council. It was clearly a substitution of the assignment of some policies of insurance for an absolute contribution of $111,000 in cash and that cannot be amended by anything passing afterwards going beyond the limitations set forth in the Order-in-Council. The writer of the letter throughout the later correspondence and the litigation which has ensued seemed determined to have his own way and to be taken as absolute interpreter of the language used, and the law bearing thereon. I cannot agree with him and hence conclude that there never was, as the company claims, any binding contract."

Another incident is that there was to have been drawn up a formal contract which, if drawn, never was executed. All that was necessary for the company to have written was: "We beg to acknowledge receipt of yours of the 17th instant enclosing copy of Order-in-Council with reference to the re-construction of the Halifax dry dock, the terms of which we accept." By reason of endeavouring to vary the terms,—and which neither the Deputy Minister of Public Works nor the Minister had power to do without a new Order-in-Council, — the company failed to make a valid contract.

H. and Company wrote The Pulp Company, "We have on hand 1,200 cords of spruce and balsam pulp, which we are willing to sell to you at $12.00 per cord f.o.b. shipping point, shipments to commence immediately and to continue at least .... shipments per month." The letter of acceptance started off something like this: "We are in receipt of your letter of .... and would be glad to have you ship us the pulpwood which you offer, but it must be understood that the wood will be cut in four-foot lengths and will be free from knots and dosey centres and will be good sound spruce and balsam pulp, not more than ten per cent of balsam." No further correspondence ensued on the question of contract, but the shipper commenced to ship and shipped several car loads and then stopped, claiming that the acceptance came so late that a good deal of the wood was sold to other parties and they had no further wood left. An action was brought in connection with the contract and you will see, if you test the matter out, that it rests on two points:

1. A straight offer;

2. An apparent acceptance of the offer, but the acceptance was so qualified that it did not make a contract and without a further acceptance by the seller, of the terms set forth by the purchaser, no contract was made.

All that the purchaser had to do to make a valid contract was to acknowledge receipt of the seller's letter and use four words, "We accept your offer".

If an alleged acceptance is not in fact a straight unqualified acceptance of the terms of the offer or purports to add any new term to the bargain it is merely a counter offer and no contract arises; *Navon Union vs McLoughlin — 4 Ir. R. 451 (1855); Gray vs Smith (1889) 43 Ch.D. 208.*

M offered to purchase an estate from H on the terms of an advertisement and he wrote purporting to accept the offer, but added new terms about a deposit and a date for completion. The letter was not replied to and the Court held there was no contract between the parties; *Honeyman vs Marryatt (1857) 6 H.L.C. 112.*

A letter purporting to accept an offer but enclosing conditions of sale imparting new terms is merely a counter offer; *Crossly vs Maycock (1874) L.R. 18 Eq. 180.*

In response to an offer there was sent a purported acceptance, "Subject to a formal contract, when any minor details can be settled". It was decided there was no binding contract; *Santa Fe Land Co. vs Forestal Land Co. (1910) 26 Times L.R. 534.*

The mere omission to mention one of the terms of the offer in the acceptance, however, is not enough to cause it to be a mere counter offer of all the terms of the offer except the omitted term.

As to Builder being Bound by Offer

A tender or an offer may be withdrawn at any time before acceptance, provided it is not under seal nor made for valuable consideration, ie. it does not amount to an option; *Holland vs Eyre (1825) 2 S. & S. 194;* but unless withdrawn a tender remains in force until it is accepted or lapses by the effluxion of time, viz. a reasonable time under all the circumstances of each particular case; *Murray vs Rennie (1897) 24 R. Ct. of S. 965.*

G offered to buy a house from R and gave R six weeks for a definite answer. It was held that G could retract the offer at any time before acceptance, although the six weeks had not expired; *Routledge vs Grant (1828) 4 Bingham 653.*

A tender is an offer and acceptance of it by the employer gives rise to a binding contract and acceptance is none the less an acceptance because the parties intend subsequently to record their bargain in some formal way.

Lord Justice Brett, (*in the case of Lewis vs Price (1877) 3 Q.B.D. 677*), says: "At the trial the question was whether at the time that the documents were signed the parties had a contracting mind. The Jury found they had and thereupon according to the written rule of Law the true construction of the letters became a matter for determination by the Court. I think that when the letter of the plaintiff's architect had been written and received a contract was made and completed. The contract mentioned in the letter was merely formal." The leading case on the subject is; *Byrne vs Vantienhoven (1880) 5 Q.B.D. 344.*

T sent an offer by letter to B. The letter was posted on October 1st and received on October 11th. B accepted by telegram the same day and by letter posted October 15th. On October 8th, T wrote withdrawing the offer. This letter was received after October 15th. The Court held that the withdrawal was inoperative, a complete contract binding both parties having been entered into on October 11th, that is, by the letter of October 1st, which was received on the 11th and accepted by telegram on the same day. The withdrawal letter was not received until four days after the contract was made. The revocation to be operative must be communicated.

Acceptance

If a mode of acceptance is prescribed and the offeree departs from this, it is open to the offerer to treat the acceptance as a nullity.

Ehasin offered to buy flour of Henshaw, requesting an answer by the wagon which brought the offer. Henshaw sent a letter of acceptance by mail, thinking it would reach Ehasin more speedily. He was wrong. The United States Supreme Court held that Ehasin was entitled to refuse to purchase.

"It is undeniable principle of the law of contract that an offer of a bargain by one person to another imposes no obligation upon the former, *until it is accepted by the latter according to the terms in which the offer was made.* Any qualification of or departure from these terms invalidates the offer unless the same be agreed to by the person who made it."

Contracts with Corporations

A good deal of difficulty occurs with contracts with corporations, unless they are signed by the proper officers and under the seal of the corporation. Contracts with municipal corporations must be under seal in cases where the contract is executory, (that is, where it is to be performed in the future), except as to contracts of an unimportant character of daily occurrence or of urgent necessity; *Clark vs Cuckfield (1852) 21 L.J. Q.B. 349.* But where a municipal corporation receives statutory powers to trade there is no distinction between it and a trading corporation and contracts entered into in the ordinary course of such trading need not be under seal. In a contract not under seal but partly verbal and partly in writing by an electric lighting authority to supply light to a consumer, it is held to be enforceable against such authority; *Bourne vs Marylebone Borough Council (1908) 72 J.P. 129.*

The well known case of Mackay vs City of Toronto is probably the latest case on this point. This case was decided by the Judicial Committee of the Privy Council on August 6th 1919. The Mayor of Toronto instructed John Mackay and Company to prepare a report as to the commercial and financial aspect............ of a contemplated purchase by the respondent corporation of certain undertakings of public utility carried on in the city. Their employment was not authorized by by-law. Under the Municipal Act of Ontario, (Sec. 10), the powers of a municipal corporation shall be exercised by its council (Sec. 249 and 258) by by-law. John Mackay and Company prepared an interim report which was printed by order of the council; Lord Haldane gave the judgment—held — they could not recover.

This is the general law, but if there is power in the Statute to any body to make purchases without by-law, the contracts are good.

In passing it might be mentioned that the city of Montreal has a peculiar Statute governing it with reference to contracts. It was found necessary to have this passed so as to prevent extravagant expenditures, and in dealing with contracts with the city of Montreal it is well to remember this Statute. The provisions are that unless an appropriation has been made for the contract or unless the contract has been passed upon by a certain public Body, the contract cannot be enforced.

An engineer was employed in connection with certain bridge building contracts in Montreal and the percentage was based upon the amount of the contract. Under the original contract the contractor performed considerable work and then was dismissed or abandoned the contract, the reason being that he had taken the contract too cheaply. Tenders were again advertised for and the lowest tender accepted. The second contractor also fell down. Tenders were again advertised for, with a like result, and the work was finally completed by the corporation. The engineer had supervision over the whole of the work, under the various contracts, and the corporation refused to pay him the percentage upon the cost of the work although partial payments had been made. The work was originally to cost $100,000. and finally cost about $300,000. It was found that the Statute relating to the city of Montreal prevented the engineer from recovering by action. One of the contractors got a special Act put through the Quebec Legislature, abrogating the provisions of the Statute and providing that his claim for work done should be arbitrated upon the basis of quantum meruit, but it is not every engineer who could succeed in getting a special Act put through.

Government Contracts and Power of the Crown to Contract

A great deal of difficulty arises with Government contracts and there is often difficulty in enforcing them, because before proceedings can be taken against the Government, by "Petition of Right", it is necessary to have a Fiat from the Attorney-General. There are some Statutory exceptions. A provision has been inserted in the Canadian National Railway Act that proceedings can be taken without a Fiat. This was to be brought into force by Order-in-Council.

The Crown can by its agents, acting within the scope of their authority, enter into contracts and the Attorney-General, suing on behalf of the Crown, can enforce such contracts against the Subject and the Subject can sue the Crown either for money due under the contract or for damages for the breach, but the Subject cannot proceed against the Crown in its own courts in the usual method, by Writ, but must proceed by Petition of Right, first obtaining, as above mentioned, Fiat of the Attorney-General.

According to the principle above laid down that the Crown is only bound by its proper agents acting within the scope of their authority, it is a duty of the Subject who has the contract to enquire whether the person proposing to contract on behalf of the Government is the agent with authority and is acting within the scope of his authority. In the case of *O'Brien vs The Queen (1884) S.C.R. 529*, Chief Justice Mitchel stated as follows: "Neither the engineer nor the clerk of the works nor any subordinate officer in charge of any of the works of the Dominion of Canada has any power or authority, expressed or implied, under the law, to bind the Crown to any contract or expenditure not specially authorized by the express terms of the contract duly entered into between the Crown and the contractor according to law and then only in the specific manner provided for by the express terms of the contract".

In the O'Brien case the contract was under seal with the Minister of Public Works of the Dominion of Canada, to complete the Deep Sea wharf for a lump sum of $78,000, agreeable to plans and specifications and to such directions as should be given by the engineer in charge during the progress of the work. By the seventh clause of the contract no extra work could be performed unless ordered in writing by the engineer in charge before the execution of the work. By letters the Minister of Public Works authorized the contractor to make certain additions to the wharf and the contractor sued for the price of these additions, but the Court held he could not recover.

In the case of *The Queen vs Starr, (1889) 17 Can. S.C.R. 118*, the contractor made a contract with the Crown, represented by the Minister of Public Works for Canada, to construct a bridge for a lump sum. After completion a final certificate was given by the engineer and the amount paid. The contractor subsequently made a claim for the value of the work alleged to have been done but not included in the final certificate, which work they alleged was caused by alterations ordered by the chief engineer of so radical a nature as to create a new contract. The Court held that the engineer had no power to make any such new contract binding upon the Crown.

In a matter relating to the city of Ottawa it was tested in *Goodwin vs Corporation of the City of Ottawa (1878) 561:* The contractor put in a superior class of masonry to that required by the specifications, without the authority of the engineer or the Board of Works, as he stated, because of encouragement received from individual members of the council, "that the city would not let me lose thereby". The Court held that what took place with the individual members of the council could not affect the matter.

Trading Corporations

Trading corporations need not contract under seal in any contract entered into in the ordinary course of the business for which they were incorporated; *South of Ireland Colliery Co. vs Waddell (1869) L.R. 3 C.P. 463.* The contract in this case was for the erection of a pumping engine and machinery for use in a colliery and part of the price was paid.

Reuter vs Electric Telegraph (1856) 6 E. & B. 341. The telegraph company was incorporated by charter and had to make contracts under a certain amount either under seal or by the signature of three directors. Reuter contracted with the company above the prescribed value and not in accordance with the above provisions, but the contract was within the scope of the company's business. Reuter did the work under the contract and was paid by cheque, which passed through the company's account. The Court held that the contract was ratified if not authorized by the company.

After the "Armistice" it was found that there were a very large number of contracts entered into with the Government of the United States and a very great number were at loose ends. Companies were instructed by subordinates, or members of departments, or officers of departments, to go on and do the work, amounting to many millions of dollars and after the armistice these contracts were cancelled and the United States Government refused to acknowledge them and in many instances refused to pay and contractors were more or less at the absolute mercy of the board constituted by the Government of the United States in respect of their claims.

It is therefore very important to consider whether a contractor has a good contract and, at the present time when there would be very keen competition for obtaining building contracts, contractors are liable to overlook this very important point until settling day comes. When once you have the contract landed see to it carefully that the contract is an enforceable one.

Variation of Contracts

Contracts required by Statute to be under seal can only be varied by an instrument under seal, but in other cases the contract under seal or any parole contract may be varied by parole, subject to the rule that a contract necessarily in writing can only be varied by a new agreement in writing.

As most of the building contracts are in writing, this point is only touched on incidentally.

Statute of Frauds

One of the former sections of the Statute of Frauds, section twelve, but now section six of the Sale of Goods Act, is as follows:

"(1) The contract for the sale of any goods of the value of $40.00 or upwards shall not be enforceable by action unless the buyer shall accept part of the goods so sold and actually receive the same or give something in earnest to bind the bargain or in part payment or unless some note or memorandum in writing of the contract be made and signed by the party to be charged or his agent in that behalf.

"(2) The provisions of this section shall apply to every such contract notwithstanding that the goods may be intended to be delivered at some future time or may not at the time of such contract be actually made, procured, or provided, or fit, or ready, for delivery or some act may be requisite for the making, or completing thereof, or rendering the same fit for delivery.

"(3) There is an acceptance of goods within the meaning of this section when the buyer does any act in relation to the goods which recognizes a pre-existing contract of sale, whether there be an acceptance in performance of the contract or not."

A fruit company's representative phoned an Italian fruit firm in Hamilton, "Do you want a car of bananas, eighths, $2.00 per cwt., seaboard?" The Hamilton firm answered, "Yes, we will take a car, but ship them immediately". The representative wired their head office at New York, "Book order for car bananas, eighths, S. & S., Hamilton, at $2.00 per cwt." Head office wired their representative, "Have booked order". By some unfortunate error in the office of their Canadian representative the latter wired S. & S. Hamilton, "Shipping your car to-morrow, — Fruit Company". The order could not be filled, as at seaboard it was found that a large part of the cargo became damaged enroute from Cuba and were unfit for shipment. S. & S. then sued for large damages for breach of the contract, but the Court said it was a contract for the sale of goods, wares or merchandise for $40.00 or upwards and there was no sufficient note or memorandum of the *bargain* signed by the party to be charged or its agent. Nothing was given in earnest to bind the bargain or in part payment, nor had the buyer accepted part of the goods sold and actually received the same. The telegram, "Shipping your car to-morrow", was not a sufficient memorandum of the bargain. The bargain meant the names of the parties, the subject matter and the terms of sale, and the telegram being the only document signed was not sufficient.

Section five of the Statute of Frauds, (old section four), is as follows:

"(5) No action shall be brought whereby to charge any executor or administrator upon any special promise to answer damages out of his own estate, or whereby to charge any person upon any special promise to answer for the debt, default or miscarriage of any other person, or to charge any person upon any agreement made upon consideration of marriage, or upon any contract or sale of lands, tenements or hereditaments, or any interest in or concerning them, or *upon any agreement that is not to be performed within the space of one year from the making thereof*, unless the agreement upon which such action shall be brought, or some memorandum or note thereof shall be in writing and signed by the party to be charged therewith or some person thereunto by him lawfully authorized."

The portion of this section to be considered is, "upon any agreement that is *not* to be performed within the space of one year from the making thereof". This section does not often affect the subject, but if there is an agreement that on the face of it shows it would not be performed within the space of one year, the section applies. The particular case in which a building contract must be in writing by virtue of the Statute of Frauds is where it is within the above section five, (old section four), as being an agreement *not* to be performed within a year. This section only applies where performance *must* of necessity extend beyond the space of one year or where the agreement clearly shows on the face of it that the parties contemplated that performance should so extend. It is interesting to note that the case deciding this point was decided in 1693; *Peter vs Compton (1693) Skin. 353.* The Statute of Frauds has stood the test of time from the reign of Charles II.

R engaged B as an accountant for one year. B was engaged on Saturday but was not to commence work until Monday. The Court said this was an agreement *not* to be performed within the year and therefore was not valid; *Brittan vs Rossiter (1878) 11 Q.B.D. 123.*

A contract with a builder for building or a contract for the employment of an architect, engineer, or surveyor, for any of his ordinary duties, is a contract for work and labour and not for the sale of goods, except that a contract for the preparation of plans would seem to be a contract for the sale of goods. Contracts for work and labour have been held not to be contracts for the sale of goods and therefore need not be in writing.

The distinction between a contract for the sale of goods and a contract for work and labour was explained by Mr. Justice Blackburn, in *Lee vs Griffiin,* as follows: "If the contract be such that it will result in the sale of a chattel, the proper form of action, if the employer refuses to accept the article when made, would be for *not accepting*, but if the work and labour be bestowed in such a manner as that the result would not be anything which could be said to be the subject of sale, then an *action for work and labour* is the proper remedy."

C contracted to print a second edition of Y's book, and C was to find the materials, including the paper. The Court held that this was a contract to do work and labour; *Clay vs Yeates (1856) 1 H. and N. 73.*

A dentist was employed to make a set of teeth. The Court said this was a contract for the sale of a chattel and not one of work and labour; *Lee vs Griffin (1861) 1 B. & S. 272.*

Effect of Statute of Frauds as to Variation and Parole Evidence

As nearly all building contracts are in writing it usually makes but very little difference whether or not they come under the Statute referred to, except as regards variation and alterations and as to the admission of parole evidence. By parole evidence is meant verbal evidence. An ordinary written contract may be varied or dissolved by parole between the parties at any time before breach, but a contract required to be in writing under the Statute of Frauds cannot be varied orally. It was long ago decided that such contracts might in equity be waived or wholly rescinded by parole agreement. The question in such cases is, "What was the intention of the parties? Was it to completely rescind or merely to vary the agreement?" For an invalid attempt to vary will not amount to a rescission or abandonment of the contract; *Sanderson vs Graves (1875) L.R. 10 Ex. 234.*

Industrial Plants and their Location

A general survey of the Principal Features to be considered in Locating, Designing, and Constructing an Industrial Plant.

F. Theo. Gnaedinger, A.M.E.I.C.

Paper read before the Sault Ste. Marie Branch, The Engineering Institute of Canada, March 2nd, 1922.

Now-a-days there is a need for engineers who can do more than merely plan and design buildings to hold certain machinery or to fulfil the requirements of certain lines of manufacturing or fabrication. This need is being met by a branch of the engineering profession known as "industrial engineering". An "industrial engineer" will not only plan the layout of the buildings and equipment for an industrial unit with its accessories, that is what we may call "the plant", but the very industry itself will be planned, tested and tried out; the sources of its raw materials ascertained; the most favourable location of the industry chosen; the enterprise promoted, organized and financed; the organization and industrial relations of the employees provided for; and sometimes even the extent of a probable market investigated. In a few words, the "industrial engineer" will undertake the planning, organization, financing and construction of an industrial unit from its conception as an idea to its realization, an accomplished fact.

It is the purpose of this paper to outline some of the principal factors involved in the location of an industrial unit, or plant, and the general duties of the engineer engaged in designing and constructing it. No attempt has been made to deal directly with the organizing and financing sides of this problem.

Location of an Industry.

There is one influence on the location of an industry which does not often bear directly upon the problem confronting the engineer in his choice of a site for a plant, and that is the "migration of industry". By this expression is meant the tendency, from a geographical point of view, for certain kinds of manufacturing to shift their centres to new fields; sometimes on account of changes in methods of manufacture or sources of power, and sometimes on account of new requirements or openings for raw materials or finished product. The trend of migration is determined by the foresight of individual proprietors and is more within the distinct field of business than of engineering. This last remark might be qualified by the statement that engineers could properly be called upon to forecast future requirements or influences acting upon the probable trend of migration. Apart from this consideration the location of an industrial unit usually involves, first, the choice of some large district within which to locate the plant, and second, the selection of the actual site itself.

Choice of District.

The following factors, in varying combinations, influence the engineer in his choice of a district within which to locate an industry: (a) Proximity to materials, (b) proximity to markets, (c) adequate power, (d) favourable climate, (e) a supply of labour, (f) capital available for the enterprise, (g) transportation facilities.

Generally speaking, the most advantageous combination of these factors is such that the sum of the cost of raw material delivered at the plant, the cost of manufacture, and the cost of marketing is at a minimum. Of course this statement applies in some of its details to the final choice of the site, but it applies more particularly in the first place to the choice of a district. It may further be noted that the influences of materials and markets grow smaller as the question of transportation becomes less, economically.

In Table I are shown the principal points to be studied in selecting the district in which to locate the plant. It is by no means exhaustive but it covers the ground in a general way.

TABLE I.

Points to be studied in Making Choice of a District.

Raw Materials:

Proximity to supply of principal materials; Abundance of supply; How laid down; Proximity to feeding industries.

Markets:

Domestic; Foreign; Nearness of competition.

Power:

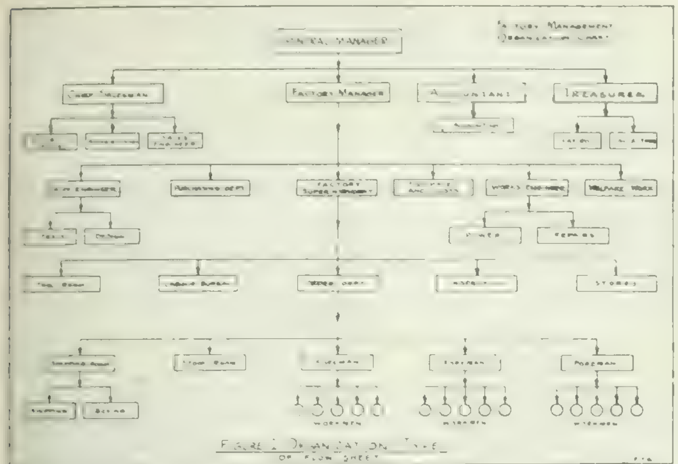
Proximity to supply of coal and oil for fuel; Cost of these laid down at plant; Natural condensing facilities afforded; Possibilities of water power development; Supply of electric power and cost.

Labour:

Sources of supply: Men, Women; Character of supply: Native, Foreign, Skilled, Unskilled; Current standard of wages; Extent to which supply is unionized; Attitude towards employers, strikes, etc.

Transportation:

Rail lines available; Navigable water courses; Street railway accommodation; Suitability of highway for motor trucks; Rates obtainable.



Raw materials must be secured in abundance and near enough to the plant, or district, so that the cost of their transportation is not prohibitive. It must be possible to regulate the supply so that it will always meet the requirements of the plant without the provision of expensive storage accommodation. Another point to be considered is the proximity of feeding industries, that is, industries supplying materials or parts required in important quantities by the proposed industry. Domestic and foreign markets must be considered in their relation to the output of the plant, and the nearness of competition reckoned with. The relative merits of the different kinds of available power, or sources of supply, usually involve a comparative study of the costs of purchasing and of manufacturing electrical energy. The main points to be considered are listed in Table I. A supply of labour must be procurable which will meet the customary requirements of the industry. In case every other condition is favourable for the establishment of the industry except that of the labour supply, it may be necessary to take steps to bring in the labour and supply living accommodation. When climatic conditions are unfavourable it will be necessary to do as much as possible to ameliorate their effects and possibly to add extra inducements in the form of high pay or long vacations. Transportation has already been touched on briefly. The main points on which information should be gathered are shown in Table I.

It is assumed throughout this paper that sufficient capital is available to finance the establishment of the industry, and that the engineer's chief concern from a money point of view is to secure the greatest value he can for the dollars expended on the project.

Choice of Site.

When a choice has been made of the district in which to establish the industrial unit there arise further considerations which influence the choice of the site itself. There are three types of locality from which to choose the site, namely, city, suburban, and country. The first usually proves the greatest attraction to the small plant and the second to the medium-sized plant. Country locations possess the largest attraction and the fewest disadvantages to the very large plant provided an adequate supply of labour can be obtained.

Among the many considerations governing the selection of the site itself may be noted the following: (a) Transportation facilities; (b) initial building requirements and possible expansion; (c) dependence on other industries; (d) local labour supply and living conditions; (e) relative value of community restrictions and community aid, legal points; (f) financial considerations; (g) relative value of local markets.

Table II gives a more extended list of the details upon which it is desirable to secure information when making a choice of the site.

TABLE II.

Points to be Studied in Making Choice of a Site.

Site:

Initial cost of land; Cost of additional land; Proximity to switching facilities; Accessibility to workers; Healthfulness; Suitableness of topography; Nature of sub-soil; Proximity to supply of building materials; Natural water supply; Advertising value.

Public Improvements:

Water supply; Sewage disposal system; Fire protection; Good roads.

Environment:

Healthfulness; Living accommodations; Schools and churches; Facilities for recreation and amusement; Community standards; Law enforcement.

Legal Points.

Laws and local ordinances; Character of local government; Tax rates.

Financial Aid.

Inducements: Bonus, Free site, Tax remittance; Co-operative capital available; Banking accommodations; Rates on water, electricity, gas, etc.

It is highly probable that in studying the data gathered, as suggested in Tables I and II, there will be several alternative sites present themselves for a final examination and comparison. The work and duties of the engineer in making his choice of the final location, and in planning, designing and constructing the plant, will now be outlined in a general way. The various steps in the procedure are given as numbered items under the three divisions of location and planning, detail work, and construction work.

Location and Planning.

1—Prepare and compile data as to present and future demands. Decide upon the objective of the proposed scheme.

2—Prepare estimated "demand curves".

3—Determine main features of operation and the probable nature of the equipment which will be suitable. What kind of raw materials will probably be best, what second choice. What will be the disposal of intermediate (if any), final and by-products, also of waste materials.

4—Collect data as to any plants for similar service that have recently been installed and compare with proposed plant.

5—Decide from "demand curves" the equipment now necessary and what extensions will probably be required in future.

6—Prepare in detail an ideal "flow-sheet" of equipment and processes.

7—Decide upon an ideal location.

8—Make an ideal layout of intended plant.

9—Determine how much land is required from a study of items 7 and 8.

10—Select properties available, (as outlined in tables I and II).

11—Prepare alternative schemes for selected sites. Make approximate estimates of costs of each, covering constructing, installation of machinery and equipment and operation.

12—Consider alternatives offered under item 11. Possibly make revised layout embodying best features of different schemes.

13—Prepare definite costs for selected site.

14—Report as to returns on investment required for project.

15—Is the owner prepared to make the expenditure?

16—Revise scheme if necessary.

17—Prepare general plans as a basis for detail work.

Flow-Sheets.

The nature and extent of the business, or process, which is to be carried on having been decided upon, it is next necessary to make studies of it in order to determine the quantities of raw and other materials which will be required, the machinery to be installed, the size of the buildings and grounds necessary to accommodate them, and also to provide for future extensions. This step in the planning is very often facilitated by means of a "flow-sheet", as indicated in item 6 above.

It is not necessary here to give a statement of the advantages to be derived from the use of diagrams for expressing data or other information. Probably one's first acquaintance with the graphic expression of facts

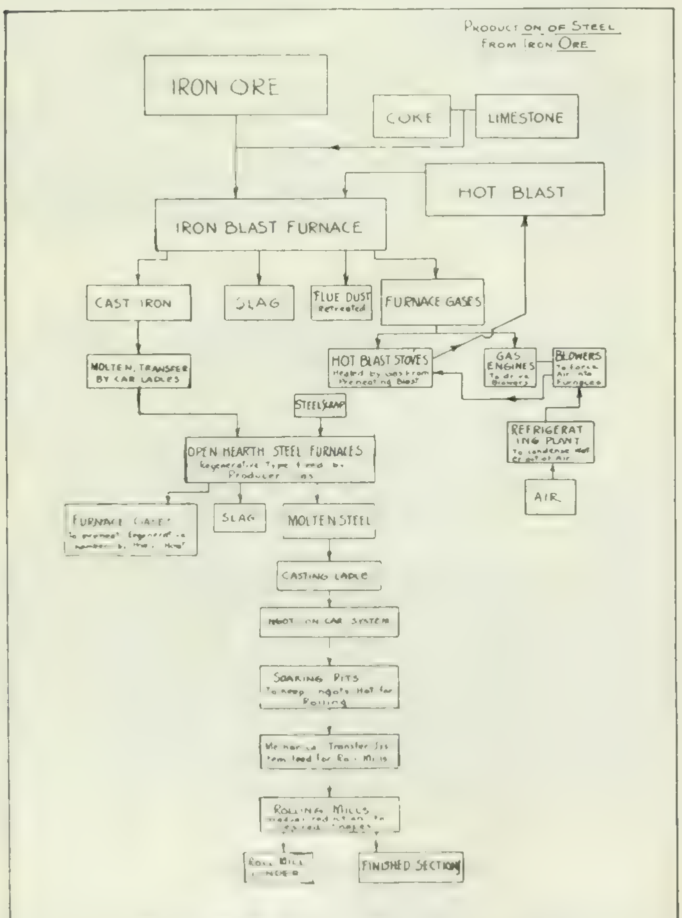


Figure 2. Process of Operations Type of Flow Sheet

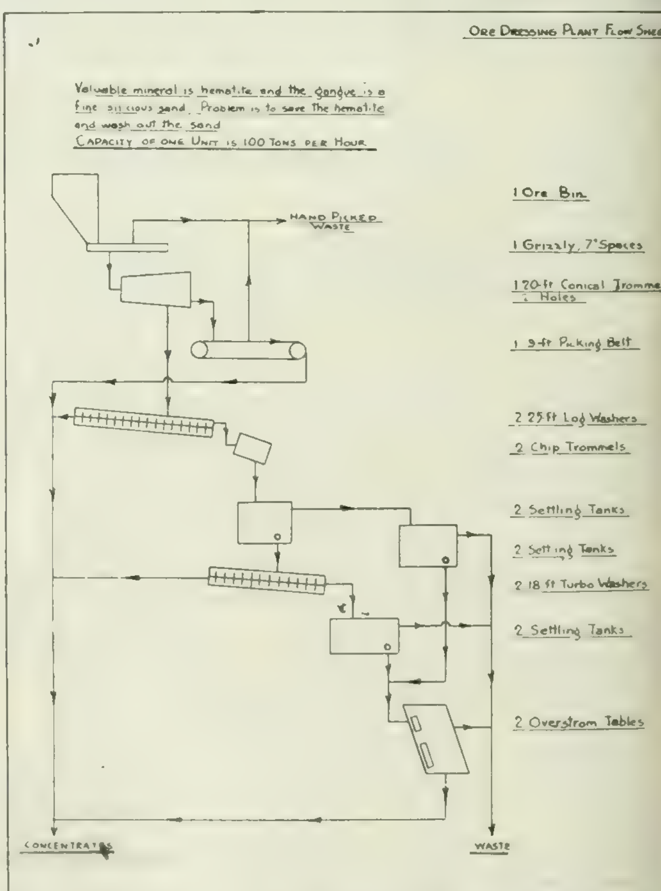

Figure 3 Machine Type of Flow Sheet

was in school history where the genealogical tree was used to show the succession and families of kings and queens.

The general purpose of a "flow-sheet" is to give, in the form of a diagram, an outline of the continuous steps in some method of treatment, or some process in industry. The origin of the word itself is probably to be found in ore-dressing where it is found in its widest use. Generally speaking, the word is there used to describe the diagrams which show the different machines and steps in a specific ore treatment, all arranged in order, and the path followed by the ore passing through them. However, it is now commonly in use to describe similar diagrams in other industries.

There are various types of these diagrams, or flow-sheets. Some give an outline of the organization of officers and employees of an industry, or of a process or series of operations carried on therein, while others give a layout of the machines or pieces of apparatus. Then again there are various combinations of these different types. Capacities and sizes of machines or equipment, quantities of materials added or taken away in a process, the cost of the different steps in a process; all these are sometimes found in "flow-sheets". Figures 1 to 4 inclusive, show simple examples of some of the principal types of flow-sheets.

The basic idea of the form and use of a flow-sheet is capable of being developed and utilized in an infinite number of ways. Besides their value as a graphic expression of a process or a series of stages in the development of some product of industry, they have a use in engineering design as well. From a simple flow-sheet, showing the steps in a process, may be prepared a more complex flow-sheet showing the continuity in the arrangement of machinery and other equipment. From this latter the engineer can prepare the general plans and typical cross-sections which will show the layout of the plant and the elevations of the different floors in it. It is also useful in preparing studies of the layout, connections and elevations of machinery and other equipment; the mechanical handling of materials; the floor areas, elevations and heights of buildings; the storage spaces for raw materials and supplies; and the necessary transportation facilities which must be provided.

Detail Work.

It is no simple matter to outline a scheme to cover the detail work connected with planning plants in general since practically every kind differs materially from every other kind, but the following one covers the ground in a general way. Plans and specifications together with all necessary contracts must be prepared for:

1—Main machinery and equipment.

2—Auxiliary machinery and equipment.

3—The power plant. Power transmission equipment and machinery for different kinds of power: mechanical, electrical, etc.

4—Boilers, boiler-room auxiliaries, mechanical stokers, mechanical draft, stack, etc. and all boiler-room equipment.

5—Coal and ash handling equipment.

6—The buildings proper.

7—Foundations for walls, special and heavy machinery, etc.

8—Mechanical handling devices and equipment, stock-yards, storage facilities, etc.

9—Water supply, lighting, sanitation, heating, ventilating, etc.

10—Roads, sidings and approaches and other transportation facilities.

11—Repair shops, stores, buildings, offices, laboratories, etc.

12—Safety devices and welfare work.

Under different sets of conditions it may be expedient to vary the order of carrying on the detail work as outlined above. In some cases a number or all of the items may be handled concurrently. One point should be especially noted in connection with item 12. In drawing up the plans care should be exercised at all times to make all machinery, equipment and buildings conform to the best "Safety First" practice.

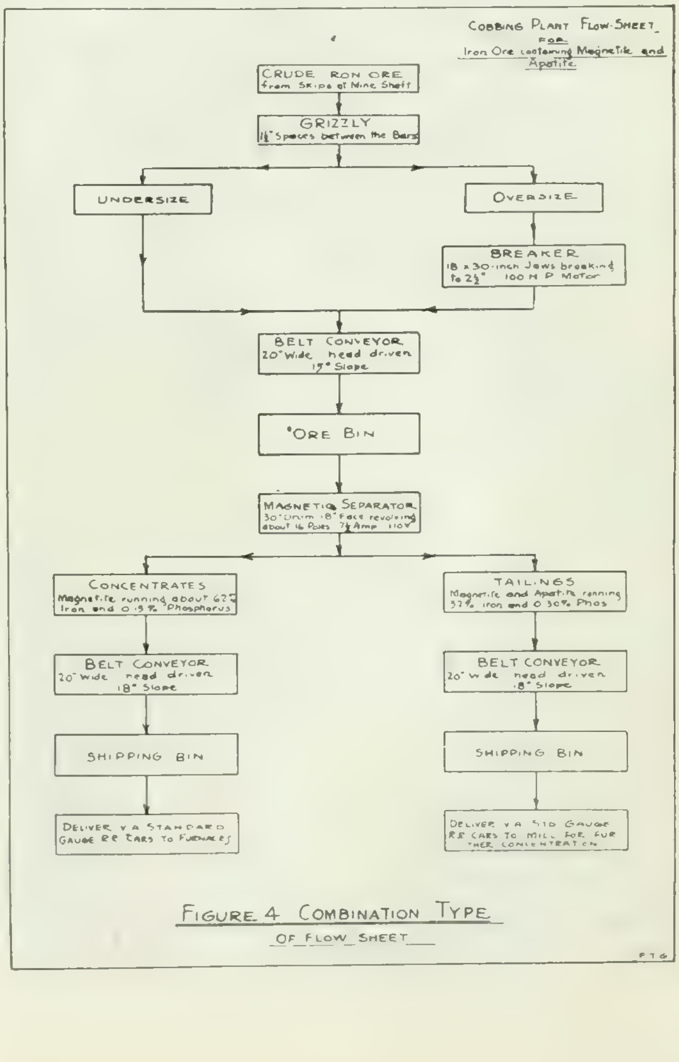

Figure 4 Combination Type of Flow Sheet

Construction.

Then follows the third stage, construction work. Under ordinary conditions the engineer will act somewhat as follows:—

1—Select firms which are to submit tenders upon the work.

2—Issue plans, specifications and copies of contracts to selected tenderers.

3—Receive and open bids.

4—Tabulate and compare tenders.

5—Let work to successful tenderers.

6—Superintend work while in progress as required by professional responsibility, understanding with owner and terms of contracts.

7—Check work as to quality and amount.

8—Issue certificates to contractors for payments by owner after completion of work, or portions of the work.

The contracts involved in the completion of the project may be drawn up in a number of different ways. The work may be done by contract for a fixed sum, or on one of the several "cost-plus" systems. The latter form generally requires more superintendence, inspection and checking by the owner or the engineer than the former, but it is very frequently considered more satisfactory and economical in the long run.

When the work is carried out on a cost-plus basis the conditions of the contract quite often reserve for the owner free access to all construction records and books; final judgement on the placing of all orders for material and equipment; and the control and direction of the general policy of carrying on the work. Customarily most of these duties are performed by the engineer or the owner's representatives.

Most of the points which must be kept track of by the engineer when the construction work is performed upon a "cost-plus" basis are covered by the details listed in Table III.

TABLE III.

Points to Observe in Handling Construction.

Schedules for:

Operations; Deliveries; Installations; Completion by units; Inspections.

Bids and Contracts for:

Equipment and machinery; Construction details; Entire buildings; Material; Installation of fixtures for: lighting, ventilation, sanitation; Decorating; Cleaning up.

Inspections of:

Buildings; Fixtures; Equipment and machinery; Material: at market, at grounds.

Cost Records to Include:

Preliminary investigations; Planning; Fees: legal, engineering; Inspection services; Construction insurance; Labour; Material; Testing; Decorating; Cleaning up.

There are many other interesting topics which might be touched upon in a paper of this nature, for example, the arrangement of plants, plans for future extensions, etc., but time limits prevent going any further into this subject.

A hasty survey has been made of the broad field of "industrial engineering". Some of the principal features governing the selection of a site for a plant have been touched upon and an outline presented of the chief duties of the engineer designing and constructing the plant. The promoting, organizing and financing of the industry not infrequently come within the field of the larger professional engineering firms, but these subjects are another phase of engineering and have not been considered to be within the scope of this paper.

The Self-Corrosion of Buried Lead Pipes

An Investigation into the corrosion of buried lead pipes in Winnipeg and vicinity, with Laboratory Experiments on the self-corrosion of lead.

W. Nelson Smith, M.E., M.E.I.C.,

Consulting Electrical Engineer, Winnipeg Electric Railway Company.,

and

J. W. Shipley, Ph.D., F.C.I.C.,

Assistant Professor of Chemistry, University of Manitoba.

Paper read before the Winnipeg Branch, The Engineering Institute of Canada, April 6th, 1922.

(Continued from the June 1922 issue, "The Engineering Journal")

Laboratory Experiments

In August 1920, experiments were started in the laboratory to ascertain the effect on lead pipe when immersed in solutions of various salts and in several typical examples of strongly alkaline soil. In about four months time, examination disclosed the fact that appreciable corrosion had started in all three of the soil samples and in the solutions of sulphates, carbonates and bicarbonates The fact that the corrosion was appreciable naturally caused the continuation of the experiments, which lasted until October 1921, with the samples which showed the most marked attack.

Lead plates, exposing about 37.5 sq. cm. of surface, were placed in salt solutions and soils, in glass beakers, on August 23rd, 1920. They were kept at a temperature of 80°C until September 10th, and the first weighings were made on September 12th. After this time they were kept at room temperature. The water lost by evaporation was replenished by adding distilled water from time to time. They were taken out and weighed again on December 13th 1920, after which they remained in the beakers, as before, until October 4th, 1921, when the final weighing was made. Table B below, gives the losses indicated at these successive weighings.

Table B.—Loss in Weight of Lead Plates placed in Salt Solutions and Soils.

Salt Solution or Soil	Loss in Grams			
	Aug. 23rd to Sept. 12th	Sept. 12th to Dec. 13th	Dec. 13th to Oct. 4th	Total Loss
$CaCO_3$	0.060	0.021	0.239	0.320
$Ca(HCO_3)_2$	0.090	0.010	0.110	0.210
Na_2CO_3	0.104	0.113	0.598	0.815
$MgSO_4$	0.116	0.016	0.206	0.338
Soil-Manitoba Gypsum Works	0.029	0.018	0.191	0.238
Soil-Glasgow ave., Winnipeg	0.009	0.005	0.590	0.604
Soil-Stock yards St. Boniface	0.009	0.003	0.239	0.251

The plate immersed in the $CaCO_3$ solution had an accumulation of lead carbonate where the plate was in contact with the glass of the beaker.

The plate in the Na_2CO_3 solution was covered with a mass of glistening white flat scales, consisting apparently of a carbonate of lead. Under the microscope the surface of the plate showed innumerable pits where the corrosion had taken place. The surface of the plate immersed in the $Ca(HCO_3)_2$ solution was covered with a black coat at first, and a very little adhering carbonate of lead was observable during the first eight or nine months. The surface of the plate in the $MgSO_4$ solution was covered with a thin coating of lead carbonate. Evidently the CO_2 of the air dissolving in the water, was the cause of the final end product of carbonate of lead.

The most striking result of this series of experiments is to be seen in the rapid increase in the rate of corrosion with the lapse of time. The one exception to this is the $Ca(HCO_3)_2$ solution, where the lead was covered with a protective coating of black oxide of lead.

It is most remarkable to observe the great increase in the corrosion of the plate buried in the Glasgow avenue soil. The loss here was more than double that in the other two soil samples and second to that of the Na_2CO_3 solution. This fact, observed in the laboratory, tallies with the very remarkable conditions observed in the corrosion of pipes on Glasgow avenue. During the past five years there have been fourteen cases of lead pipe corrosion in one block on that avenue, adjacent to Osborne street. Half of these occurred before the system was changed to three-wire operation in March 1919, and the other half have occurred since that time, there having been repeat cases on five of the pipes, though not necessarily at the same spot. A careful examination was made of the polarity of this water main last summer, with the delicate galvanometer and testing terminals above mentioned, and it was quite clear that the result of three-wire operation of the electric railway, which had been continuous for over two years, was to cause the polarity between pipe and earth to oscillate constantly, at least as often as once every minute or two, between positive and negative, with the majority of readings negative. The soil of Glasgow avenue is of the same light coloured limy silt so frequently found to be present where lead pipes are corroded. The locality is nearly half a mile from the

nearest substation. In this connection it may be of interest to note that four different analyses of ground water from Glasgow avenue showed the following weight of free CO_3 per 100,000 grams of ground water:— 26 grams, 43.2 grams, 129.6 grams and 54 grams; or an average of 63.2 parts per 100,000 of the CO_3 radical alone.

This may not mean that the carbonic acid of itself starts the corrosion, but its presence causes the lead hydrate that has been formed in the original solution to be changed to insoluble lead carbonate, leaving the soil solution relatively free from lead ions and ready for further attack upon the lead. Thus the fixing of the lead hydrate as carbonate tends to continue the auto-electrolytic corrosion of the pipe.

Besides the above experiments upon lead with soils and salt solutions, some experiments were made with lead as the anode, and as the cathode, of an electrolytic cell.

Corrosion of Lead Anodes

Three experiments were performed with lead anodes and cathodes immersed in saturated soils contained in beakers. Through these, ten milliamps were run continuously for three days after which the series was discontinued owing to the disintegration of the anodes. A mixture of lead oxide and lead peroxide formed at the anode and the plates became badly pitted, some of the lead falling away mechanically. The loss at the anode was far beyond that required by Faraday's Law. The cathodes were not attacked, but a coating of carbonate formed on their surfaces. The results of the series are contained in Table C below:—

Table C.—Loss Sustained by Lead Anodes in 72 Hours with 10 Milliamps Current.

Soil Sample	Weight of Cathode in grams		Weight of Anode in grams		Loss at Anode in grams	Percentage loss of theoretical
	before	after	before	after		
Manitoba Gypsum Wks.	61.567	61.570	70.555	66.400	4.155	150%
Glasgow street.	71.291	71.300	76.023	70.170	5.853	210%
Stockyards ...	61.807	61.809	57.034	47.360	9.674	350%

It will be noticed that the corrosion of lead by electric current is exceedingly rapid, nearly 10 grams of lead being dissolved by 10 milliamps, or 0.01 ampere, in three days time in a representative sample of alkaline soil. The fact that the actual loss is from 150% to 350% of the theoretical loss, is fairly good proof of the futility of attempting to apply theoretical "coefficients of corrosion" in estimating the life of a buried pipe exposed to electrolytic conditions, where it may be possible to have five or more different compounds of lead in the end products, as will be shown later. As the electrolytic disintegration of the anode proceeds, with the possible formation of a variety of end products, the mechanical disintegration must also be very greatly increased due to the volume changes within the mass of the lead anode, by reason of the expansion of these products which occupy more space than the original lead. This may account for the very great increase of the actual over the theoretical loss.

An examination was also made of the theory that in an alkaline soil a lead cathode will react with the supposedly existent alkaline hydrate to form lead hydrate, which ultimately becomes lead carbonate, the lead cathode being in this case as subject to corrosion as if it were an anode. These cathode experiments and results are as follows:—

Corrosion of Lead Cathodes

Lead cathodes and carbon anodes were immersed in salt solutions. A current of between 4 and 10 milliamps was continuously passed through the solutions for sixty days during which time about 38,000 coulombs flowed through the circuit. The carbon anodes were badly corroded and in the case of the chloride solutions, free chlorine was evolved and the solutions became saturated with the gas. Gas was evolved at both poles in almost all cases, being most marked in the magnesium sulphate and sodium carbonate solutions. Colloidal carbon was formed in the magnesium sulphate and sodium carbonate solutions.

The cathodes were covered with a more or less loosely adhering coat of carbonate, excepting that in the solution of magnesium sulphate the cathode was covered with a coating of finely divided carbon only. After removing these superficial coats it was found that the cathodes had sustained very little, if any, loss. It was found difficult to remove the scale without taking off some of the lead, so that the small losses listed in Table D below, may or may not be real losses. They are of the same order as the losses found by the action of salt solutions acting alone, given in Table B.

Table D.—Loss sustained by Lead Cathodes, exposing 37.5 sq. cm. surface with Carbon Anodes and a Current varying from 4 to 10 Milliamps. Time 60 days.

Salt Solution	Weight of cathode in grams.		Loss in Grams
	Oct. 15th	Dec. 15th	
Na_2CO_3......	73.705	73.680	0.025
$Ca(HCO3)_2$....	63.170	63.140	0.030
$MgCl_2$........	63.891	63.770	0.121
$CaCl_2$........	72.090	71.944	0.146
NaCl.........	73.952	73.927	0.025
$MgSO_4$.......	63.240	63.240	0.000
$CaCO_3$.......	72.717	72.702	0.015
$CaSO_4$.......	72.733	72.720	0.013

From the foregoing experiments we derived assurance first, that even where no stray current is present, corrosion in soils containing soluble salts, especially carbonates, is inevitable; second, that lead anodes in soils containing soluble salts corrode with extreme rapidity; third, that lead cathodes in salt solutions and in soil do not corrode appreciably more in the same time with a current density of $\frac{3}{10}$ milliamps per sq. cm., than in salt solutions, or in soil, without stray current.

The Action of Salt Solutions on Lead in the Presence of a Soluble Nitrate

Whenever the subject of lead electrolysis has been discussed, reference is nearly always made to the assumed presence of nitrate in the soil as an electrolyte that promotes stray current corrosion. This suggests the possibility of a nitrate promoting self-corrosion, because of the known solubility of lead in nitric acid. The following experiments were made in order to throw some light, if possible, on the corrosive influence really exerted by nitrates in the soil.

It should be remarked that the presence of nitrate is an elusive sort of condition. The commonest supposed source of nitrate is the decomposition of organic matter. The presence of nitrifying bacteria is known to cause nitrates to be formed out of the organic matter in the soil. As soil conditions are liable to constant change with the circulation of ground water, and all nitrates are highly soluble, it is not so easy to tie up nitrates to participation in a given case of corrosion, as it is the solutions of salts originally inorganic, like the sulphates, chlorides and carbonates, whose presence is so self evident in the soils of this locality.

Normal tenth solutions of the below listed salts were prepared and pieces of lead exposing 60 sq. cm. of surface were immersed in 400 cu. cm. of each solution. To each was added one gram of ammonium nitrate. The bottles were kept tightly corked at room temperature from February 2nd until September 16th. The plates were then removed from the solutions, cleaned, and weighed. The results are given in Table E.

Table E.—Action of Salt Solutions on Lead in the Presence of a Soluble Nitrate.

Salt Solution	Weight Feb. 2nd	Weight Sept. 16th	Loss
Saturated $CaSO_4$	49.235	49.180	0.055
Saturated $Ca(HCO_3)_2$	49.509	49.180	0.329
$\frac{N}{10}$ $MgCl_2$	49.668	49.430	0.238
$\frac{N}{10}$ MgSO	47.412	47.260	0.152
$\frac{N}{10}$ $CaCl_2$	47.220	46.950	0.270

In every case the surface was covered with a coat of black oxide of lead of varying thickness. This coat was very heavy on the lead plate immersed in the $MgSO_4$ solution and quite thin in the case of the $CaCl_2$. Spots of $PbCO_3$ with pits beneath were very marked on the plate immersed in $Ca(HCO_3)_2$. The damage was slight in the case of the $CaSO_4$, a few little nodules of $PbSO_4$ having formed here and there over the surface. Where the plate touched the glass in the $MgCl_2$ and $CaCl_2$ solutions a heavy deposit of mixed lead carbonate and chloride formed. Deep pits were found beneath these incrusted spots.

Apparently the corrosion in the presence of ammonium nitrate during a relatively short exposure is not of noticeably different order than with the salt alone, although it would doubtless take considerably more experimenting to establish any very definite relation. The formation of the protective coating of black oxide of lead is probably due to the presence of the nitrate as it is an oxidizing agent. After cleaning and weighing, the plates were returned to their respective solutions and almost immediately a black deposit formed again over their surface. Some four or five months subsequently, it was noticed that white deposits were rapidly gathering on the plates, those in the calcium salts showing the heaviest incrustations, especially the sulphate and bicarbonate. The absence of corrosion at first, and its presence subsequently, make this experiment somewhat inconclusive as to the inhibitive effect of a nitrate.

In order to obtain quick action and visible evidence of corrosion both in salt solutions and soils, and especially to examine the effect of the contact of lead with two soils of a different character as a condition that would possibly promote corrosion, strips of lead foil, as well as some lead plates, were exposed to corrosive actions as indicated below. The results were not gauged by weighing but by the appearance of the samples after they had been under treatment from the middle of February until the first part of October.

The Corrosion of Lead Foil in Salt Solutions

Five strips of lead foil were immersed in 400 cc., of the same salt solutions as described in the preceding experiment, the same quantity of ammonium nitrate being added. The strips were mounted on paraffin wax plates. The strips were immersed February 2nd 1921. It was expected that corrosion would show itself by the perforation of the lead foil and this actually happened to the foil immersed in the $Ca(HCO_3)_2$ solution, in July. By October 4th the perforation had spread over a considerable area of the foil. The foil in the $CaCl_2$ and $MgCl_2$ was also badly attacked but the perforations were not nearly so general as with the bicarbonates of calcium. The foil immersed in the sulphates of calcium and magnesium were the least attacked. In every case the lead was covered with a black coat of oxide. Had this experiment been performed without the addition of the nitrate, perforation of the foil would possibly have occurred earlier.

The Corrosion of Lead Plates and Lead Foil in Soils

Three lead plates and four wax-supported strips of lead foil were buried in moist soil and left undisturbed for several months. The plates and strips were about six inches long and two inches wide. They were placed vertically in glass tubes and the soil packed in around them. The tube was tightly corked at both ends. Each tube contained two samples of soil, the upper end of the lead being in one kind of soil and the lower end in a soil from another locality.

No.	Lead	Soil above	Soil below
1	foil	Glasgow street	Kennedy and Broadway
2	"	Edmonton street	Surface soil Jubilee and Daly
3	"	St. James	River Park
4	"	River Park	Sand under pavement, Archibald st.
5	plate	Surface, Jubilee and Daly	Edmonton street
6	"	C. P. R. Shops, Weston	Jubilee and Pembina
7	"	Assiniboine ave.	Selkirk

The lead foil and plates remained in contact with the soil from February 5th until September 9th, with the one exception of No. 6, which was examined June 22nd.

No. 1. Lead foil badly attacked at the upper end, completely perforated. Lower end also corroded and blackened.

No. 2. All foil beyond end of wax completely destroyed. Lower end of foil also badly corroded.

No. 3. Corrosion completely through at upper end and lead disappeared. Lower end also perforated. White lead salt formed.

No. 4. Both ends where surrounded by soil completely destroyed. Elsewhere perforations especially where the soil found its way between the wax and the foil.

No. 5. Lead plate pitted deeply in portion buried in surface soil. Pits $\frac{1}{32}$ inch deep or more. $PbSO_4$ incrusted over pits.

No. 6. Slightly incrusted but not badly attacked.

No. 7. Badly corroded and incrusted. White incrustant of lead carbonate $\frac{1}{32}$ inch thick on both sides of upper end of lead strip. Lower end not so badly attacked. No sulphate.

The results of this series of experiments was decidedly illuminating. They established without doubt the corrosion of lead by the action of the soil alone. The nature of this corrosion was quite similar to that observed on the lead service pipes in various parts of the city; the same crater-like cavities, covered by a white incrustant of lead sulphate or carbonate. The extent of the corrosion was quite remarkable. In seven months time pits nearly $\frac{1}{32}$ inch deep were formed.

Summary

(1) Salt solutions attack lead forming the carbonate of lead when exposed to the air.

(2) The carbonate of soda is the most corrosive of the salts experimented with.

(3) The presence of ammonium nitrate seemed to inhibit initial corrosion by the formation of a protective coating of lead oxide over the surface, but this inhibitive action may be only temporary.

(4) The soils of the Winnipeg district have a decidedly corrosive action on lead, the nature of the corrosion being that of a crater-like pitting of the surface with a deposit of lead sulphate or carbonate in the neighborhood of the pitting.

The Chemical and Physical Peculiarities of Lead

Lead belongs to a group of metals possessing characteristics that in chemistry are termed "amphoteric", which means that it has a sort of dual character as regards its reactions with acids and bases. The monoxide of lead, PbO, is quite basic in character and readily combines with water forming lead hydroxide, $Pb(OH)_2$, from which carbonates and sulphates of lead are readily formed. This hydroxide gives an alkaline reaction in water.

The brown oxide of lead, PbO_2, or lead dioxide, is somewhat acidic in character, forming a series of salts with the more strongly basic metal, like sodium, potassium and calcium, which salts are known as plumbates. Thus we have sodium plumbate, Na_2PbO_3, and calcium plumbate, $CaPbO_3$. In this way lead is capable of acting as a base, then forming a series of salts such as lead nitrate, lead carbonate, lead sulphate etc., or it may be found as part of the acid radical forming with another metal a series of salts like the plumbates. This lack of definite basic or acidic characteristics makes the metal a tool of its environment. It may be expected to act basic if in an acidic environment, and acidic if in a stronger basic environment.

Lead is relatively insoluble in hydrochloric and sulfuric acids, but is readily attacked by nitric and acetic acids. Certain other organic acids will corrode lead. A coating of oxide readily forms upon the surface of metallic lead, which is commonly believed to protect it from corrosion. This coating, however, is actually soluble in water, the more so if the water be quite pure or if it carries much oxygen in solution. The sulphate of lead is slightly soluble in water and the carbonate much less soluble so that, in the presence of the acid radicals of sulfuric and carbonic acids, the lead hydrate is easily transformed into carbonate or sulphate, and the sulphate may be transformed into the more insoluble carbonate.

According to several authorities, lead has a peculiar physical property of occurring in more than one physical modification, even in the same piece of metal, and these allotropic modifications may occur quite near together in the same metal. These variations of the physical structure of the lead possess different physical and electrical properties and these differing properties may persist for a long time. Consequently adjacent portions of lead in the same piece of metal may set up a galvanic couple when in contact with an electrolyte, and provide all the conditions required for electrolytic self-corrosion. This property of lead has been investigated by Messrs. Lambert and Cullis, (see Journal of the Chemical Society, 107-210, 1915,) who have observed as follows:—

> "The electrolytic theory of corrosion is applicable to lead. The passing of the metal into solution which precedes corrosion is due to electrolytic action between the electrically different parts of the mass of lead. In the case of chemically pure lead, the physical heterogeneity due to the presence of different allotropic modifications of lead in the mass of the metal, causes some parts of the mass to be electrically different from other parts, and these electrical differences persist for a long time after the preparation of the metal."

The practical effect of this allotropic property of lead is met with in practice by users of lead pipe. This property was observed, for instance, by the engineer of the Mental hospital at Selkirk, who exhibited a piece of lead pipe taken out of the earth, where it had been buried for some years, which he said had "lost its life". That is to say it was very brittle, had a different appearance from ordinary lead, and was no longer suitable for being worked.

Messrs. Lambert and Cullis found that the purest lead that it was possible to produce by distillation in a vacuum was immediately corroded when immersed in water containing oxygen. The first product of corrosion

under such circumstances is evidently lead hydrate, which, when there are no other salts present, will appear as a precipitate. It has also been ascertained by a number of observers, that hydrogen peroxide is formed when lead, water, and oxygen are brought together. This is a strong oxidizing agent and accordingly might well account for the presence of the higher oxides of lead which are sometimes found amongst the corrosion products of lead pipe. Several such transformations of lead have been observed. A lead union from a service pipe in Moose Jaw, Saskatchewan, sent in for examination, was found to be almost wholly transformed into a red oxide of lead. A similar case was shown by A. Blackie, city chemist of Winnipeg, in which a considerable portion of a piece of lead pipe consisted of a red oxide of lead. Black oxide of lead was also observed on service pipes from River and Glasgow avenues in Winnipeg. The corroded lead pipe taken from Selkirk had an insoluble lead compound sticking to the matrix of clay that surrounded the pipe, which was probably lead peroxide. There was not enough of it to make an analysis.

L. A. Stenger, in Chemical and Metallurgical Engineering, May 1920, attributes the soil corrosion of lead pipes as observed by him to two probable sources: (1) The action of a concentration cell produced by differences of concentration of a salt in the soil in contact with the pipe, and (2), the presence in the soil of a substance subject to a change in valence, the bi-electrolyte causing corrosion in the cathode areas. The first of these two causes is similar to that described by the authors in a former paper on the self-corrosion of cast iron. The effect on lead pipe would be practically similar to that observed on iron pipe, that is, the lead would pass into solution where the metal was in contact with the more dilute electrolyte. The mechanism of this process was indicated in diagrams in the former paper. Both of these causes of corrosion as outlined by Mr. Stenger are external to the pipe and not in any way dependent upon the lack of homogeneity in the lead.

A recent article contributed to Metall und Erz, volume 16, 1920, on the destructive action of mortar on zinc and lead, states that lead is attacked by limestone alone and by mixtures of limestone and gypsum. This is substantiated by the experiments published by Richard H. Gaines, mentioned above, as well as by the case of corrosion noted at Charlottenburg, Germany.

H. S. Rawdon in a paper published in April 1920, by the Bureau of Standards, bulletin No. 377, describes the results of a series of experiments on lead corrosion which show that the so-called allotropic modifications of lead are produced by corrosion in an electrolyte, by the solvent action of the salt solution removing the foreign metals lying between the crystals of metallic lead in the mass of the lead. Even the purest commercial lead is subject to this attack and, since the metallic impurities removed lie above lead in the electro-chemical series, this form of corrosion is quite parallel with the galvanic action brought about between graphite and iron in cast iron, when iron goes into solution and graphite remains in the pipe. In the case of lead pipe the impurities are removed and the lead in unsupported crystals remains, imparting to the pipe that characteristic crystalline structure and brittleness which eventually destroys its usefulness.

These observations of Rawdon supplemented by a later investigation*, in which he used lead of 99.99% purity subjected under tensile stress to the corrosion of salt solutions, afford an unexampled instance of the possibility of electro-chemical destruction due to the presence of almost infinitesimal amounts of an impurity in the metal structure when such a structure is in contact with water containing salts in solution. Rawdon also observed that the corrosion of lead was more rapid in an acid solution. Recent investigations in the laboratory of the University of Manitoba, (not yet published), indicate that the soil waters of Winnipeg in the presence of $CaSO_4$ and $CaCo_3$ are slightly acid especially when they contain free carbon dioxide. Moreover the function that mechanical stress plays in promoting the corrosion of lead would lead to widely diverging observations on the extent of the corrosion at different places on the same lead pipe buried in the same soil. Wherever the pipe was bent, there the pipe may be considered to be under stress, and there intergranular cracks as described by Rawdon would first appear, the rapidity of the disintegration depending on the amount of the stress and the character of the soil solution.

We thus see how complicated is the whole matter of the corrosion of lead. Not only does the peculiar amphoteric character of lead enter into it but also the physical character of the crystalline metal structure, the infinitesimal amounts of intergranular impurities present, and the stress to which the structure is subjected. These factors, combined with the complexities of the salt content of ground waters, make the whole question of the soil corrosion of lead a matter for most intensive study.

Electrolytic Theory of Self-Corrosion Fits Observed Facts.

Our experiments have established in striking fashion the self-corrosion of lead in various solutions and soils taken from Winnipeg and vicinity, this corrosion being of the same general appearance and carrying the same end products as are found on the service pipes buried in the soil here and there about the city and vicinity. It is now evident, from our knowledge of the characteristics of lead and from the known effects upon it of water containing oxygen and carbon dioxide, that, *when buried in soil containing pulverized limestone and gypsum, a lead pipe is in corrosive surroundings.* The samples of soil used in the laboratory experiments all contain a proportion of carbonate and sulphate of lime, which other experimenters have shown to be corrosive to lead. The pock-marked variety of self-corrosion so frequently observed, both on the test pieces and on service pipes about the city, suggests local galvanic action such as Lambert and Cullis attribute to allotropic modifications in the lead itself. The cavities would occur on the lead where that modification of lead having the highest electrolytic solution pressure existed, and there the metal goes into solution. But in a soil such as that underlying the city of Winnipeg, the ground water is rich in carbonate and sulphate, and the lead ions,

*Rawdon, Krynitsky & Berliner,—"Brittleness produced in pure lead by Stress and Corrosion", Chemical and Metallurgical Engineering, Jan. 1922.

travelling out with the self-generated galvanic current, soon meet and combine with these salts, forming insoluble lead sulphate and carbonate in the form of a white incrustant covering the cavity from which the lead was dissolved. Should the ground waters adjacent to the pipe be relatively free from sulphate or carbonate, the lead would likely form hydrate and this in turn would be transformed sooner or later into oxides of lead.

If the lead ions travelled an appreciable distance from the pipe before being fixed as hydrate, carbonate, sulphate, or oxide, the lead combined would be found adherent or incorporated in the soil and free from the pipe, and the pipe on exposure would be found corroded in a pock-marked manner, but not encrusted. Should the lead ions be precipitated immediately on going into solution, an adhering encrustant on the surface of the pipe would result. In the case of the lead union previously mentioned as partly transformed into red oxide of lead, this transformation had occurred in place and had changed a large portion of the wall of the pipe from metallic lead into oxide without greatly altering the external form of the pipe.

Hydrogen Peroxide Effects.

According to the work of Traube, (Zeit. Phys. Chemie 1900), hydrogen peroxide is produced when lead is acted upon by water containing dissolved oxygen. This strongly oxidizing peroxide reacts further with the oxide of lead producing progressively the higher oxides of lead. Lambert and Cullis (loc.cit.) point out that this reaction would equally likely occur in the auto-electrolysis of lead but as it is only a secondary result it does not in any way affect the course of the corrosion. The end products, however, would be the production of the orange yellow or red oxide of lead. These chemical changes would be represented by the following equations: (1) $Pb + H_2O + O_2 = PbO + H_2O_2$; (2) $PbO + H_2O = Pb(OH_2)$; (3) $Pb + H_2O_2 = Pb(OH)_2$.

Should this oxidation proceed further the PbO would be transformed into the higher oxides by the H_2O_2 as follows: (4) $PbO+H_2O_2=PbO_2+H_2O$; and if we accept the assumption of the two highest oxides as being produced from PbO and PbO_2, then (5) $PbO+PbO_2=Pb_2O_3$ (an orange yellow oxide) and (6) $PbO+2PbO_2=Pb_3O_4$ (red lead). Thus the formation of H_2O_2 would account for the transformation of the lead into the orange yellow oxide of lead or even to red lead itself. Including the hydrate, five (5) separate compounds of lead and oxygen may be formed.

On the other hand, a section of service pipe taken from No. 468 Glasgow avenue in August 1921, was corroded in the characteristic pock-marked manner, and adhering deposits of carbonate were in evidence, but the cavities were largely free from incrustations. There were also deposits of lead oxide on the pipe, varying in colour from black to red, and these deposits were in the immediate neighbourhood of the cavities. The intimate mixture was of such a nature that the pitting and the oxide formation must be attributed to a common cause. It is possibly of some interest to mention that the surface of the oxide was cracked and fissured, the cracks extending down to the metallic lead.

We thus find that the products of corrosion in the case of lead are extremely varied and are determined largely by the environment. The amphoteric character of lead, together with its intercrystalline impurities which Rawdon found to have such an important function in corrosion, provides a reasonable explanation for the variety of these products as well as for the corrosion itself.

It is evident that lead, although a nobler metal than iron and close to hydrogen in the electro-chemical series, may yet be subject to severe attacks due to slightly changing physical or electro-chemical conditions. With the soil environment that exists about the Winnipeg water-service pipes, it is possible to have a number of conditions present, any of which are capable of resulting in the corrosion products observed both in the field and the laboratory. These may be summed up as follows:—

1. Differences of concentration in the ground water solutions surrounding the pipes, initiating an electrolytic condition.

2. Contact with soil containing water having oxygen and carbon dioxide in solution is, of itself, sufficient to start corrosion of the lead. This is especially the case when the pipe is surrounded by cement, mortar, or soil containing pulverized carbonates.

3. Decomposing organic matter in contact with lead independently of other causes, provides ample means for corroding it.

4. Differences in physical structure of a lead pipe itself, which bring about different solution pressures of the lead in adjacent areas on the pipe and set up electrolytic corrosion by creating local galvanic battery cells.

5. Metal impurities lodged between the crystals of lead permit electrolytic attack of the lead along the crystalline boundaries when the pipe is subjected to ground waters containing salts in solution.

With respect to the protection of buried lead pipes from chemical attack the only practical suggestion that can be made now, is to provide an impermeable continuous and enduring waterproof coating over the lead, of a character and thickness that will not deteriorate in the presence of the substances that cause the deterioration of lead. If this coating were to consist of a thick paste of commercial white lead paint, laid on with a spiral wrapping of burlap thoroughly impregnated with the white lead, it should afford protection against corrosion from soils high in carbonates and other more soluble salts. The artificial coating of insoluble lead carbonate could not react with the CO_2, the carbonates, or with the other more soluble salts in the soil, nor could it injure the lead pipe.

Laboratory experiments have proved that corrosive reactions such as those described in the foregoing paper, are possible without any assistance from stray current. it is therefore necessary to test the polarity to earth of a buried pipe, whether of lead or cast iron, before it can be claimed that the pipe is corroded through the agency of a stray current from an outside source.

Professional Meeting 1922

Winnipeg: September fifth, sixth and seventh.

First B.C. Professional Meeting Marked by Enthusiasm

The first British Columbia Professional Meeting of *The Institute* was held in Vancouver on June sixteenth and seventeenth under the joint auspices of the Vancouver and Victoria Branches, and proved to be one of the most enjoyable of the many successful gatherings held throughout the country by *The Institute.* The weeks of preparation by the committees in charge of the meeting, were amply rewarded in the results obtained and the Pacific Coast Branches have established for themselves a lasting name as hosts. With a programme of such exceptional engineering interest, and entertainment of a kind which can only be provided on the western coast, and favoured with perfect weather, the two days allotted for the meeting were all too short for the visiting members. One hundred and twenty-eight members registered, representing the numerous branches of the profession from coast to coast. The excellent papers and discussions and the visits to points of engineering interest created an enthusiasm which is rarely attained at so large a meeting.

The programme, which is given in detail below, contained papers of particular current interest and each paper brought forth lively discussions. Registration on Friday morning was followed by an address of welcome by His Worship, Mayor Tisdall of Vancouver. The paper on Town Planning in British Columbia, by James Ewing, M.E.I.C., of Montreal, aroused great interest and resulted in the passing of a resolution, addressed to Council, recommending that steps be taken to have the Provincial Governments take a greater interest in the movement, in parts of the country where this has not already been evidenced. The luncheon, on the first day of the meeting, was held jointly with the Canadian Club, at the Hotel Vancouver and afforded an opportunity for a social meeting of the members of the two organizations. The visit to the Ballantyne Pier during the first afternoon was arranged through the courtesy of A. D. Swan, M.E.I.C. consulting engineer of Montreal, and the Northern Construction Company, Limited, and the inspection of this important Canadian Government harbour development proved of great interest to the members and their guests. At the Friday evening session the members were given an excellent idea of the engineering features encountered in the famous logging industry of British Columbia by T. W. Fairhurst, A.M.E.I.C., of Vancouver. The paper on "Irrigation in British Columbia" by P. J. Jennings, M.E.I.C., of Calgary, which was originally planned for the morning session was presented during the evening and on account of the general interest in this subject it was necessary to delay the discussion which followed Mr. Jenning's paper until the Saturday morning session

The business meeting which was held on Saturday morning gave rise to the enthusiastic discussion of a number of very important Institute affairs and as an outcome of this discussion a resolution was unanimously passed endorsing the recommendations contained in the report of the Committee on Policy. In consideration of the Policy Committee's recommendations, it was resolved

that no action should be taken to re-establish the Provincial Division of *The Institute*. A resolution presented by the Victoria Branch advocating the co-ordination of the engineering legislation of the various Provinces was also endorsed at the meeting. Votes of thanks were tendered to the officials of the City of Vancouver; to the Canadian Pacifical Railway officials; to A. D. Swan, M.E.I.C., the Northern Construction Company, Limited and Wm. Smaill, M.E.I.C.; to Major Geo. A. Walkem, M.E.I.C., Chairman of the Social and Reception Committee; to the University Club of Vancouver for courtesies extended to visiting members; to the Automobile and Service Clubs of Vancouver and New Westminster and the Canadian Good Roads Association for their courtesy in providing sightseeing excursions; to the authors of the various papers and those leading in the discussions; and to the committees through whose able management this most successful Professional Meeting was made possible.

Programme of the B.C. Professional Meeting.

FRIDAY, JUNE 16th.

8.45 a.m.—REGISTRATION at Hotel Vancouver.

9.30 a.m.—ADDRESS OF WELCOME:
His Worship the Mayor of Vancouver.

9.45 a.m.—TOWN PLANNING IN BRITISH COLUMBIA:

James Ewing, M.E.I.C., Ewing, Lovelace & Tremblay, Civil Engineers, Montreal.

DISCUSSION:

H. M. Bigwood, A.M.E.I.C., Chief Draughtsman, Dominion Public Works Department, Victoria.

W. B. Young, A.M.E.I.C., Designing Engineer, City Engineer's Department, Vancouver.

W. B. Greig, A.M.E.I.C., Municipal Engineer, Point Grey.

11.30 a.m.—IRRIGATION IN BRITISH COLUMBIA:
Ernest A. Cleveland, M.E.I.C., Consulting Engineer to Department of Lands, Victoria.

DISCUSSION:

P. J. Jennings, M.E.I.C., Acting Assistant Commissioner of Irrigation for Alberta and Saskatchewan, Calgary.

A Representative of the Water Rights Branch, Victoria.

1.00 p.m.—LUNCHEON AT HOTEL VANCOUVER.
Special Address will be arranged.

2.30 p.m.—INSPECTION VISIT TO BALLANTYNE PIER.

This has been arranged through the courtesy of A. D. Swan, M.E.I.C., Consulting Engineer, Montreal, and The Northern Construction Company, Ltd., Contractors. The party will be in charge of Wm. Smaill, M.E.I.C., Chief Engineer, Northern Construction Company, Ltd. Water Transportation by courtesy of Geo. A. Walkem, M.E.I.C., Vancouver Machinery Depot, Ltd.

8.30 p.m.—PROFESSIONAL ENGINEERING IN THE B. C. LOGGING INDUSTRY.

Illustrated with Lantern Slides.

T. W. Fairhurst, A.M.E.I.C., Sales Engineer, Vancouver Machinery Depot, Ltd., Vancouver.

DISCUSSION:

By the Vancouver and Victoria Branches.

SATURDAY, JUNE 17th.

9.00 a.m.—BUSINESS MEETING.

There will be short addresses on the following topics:

POLICY:
W. G. Swan, M.E.I.C.

WELFARE:
D. O. Lewis, M.E.I.C.

BRITISH COLUMBIA PROVINCIAL DIVISION:
G. A. Walkem, M.E.I.C.

DISCUSSION:
As these questions are closely related, the discussion will be regulated by the Chairman.

11.30 a.m.—EXCURSIONS.

Through the courtesy of the Vancouver City Council and the City Engineer, an excursion to the Scott Ranch, Seymour Creek, North Vancouver, has been arranged, where a luncheon will be provided for the members. Following this the party will be conducted over the Seymour waterworks intake, and other features of interest.

For those who desire other entertainment, sightseeing excursions to the Lower Mainland have been arranged through the courtesy of the Automobile and Service Clubs at Vancouver and New Westminster, co-operating with the Canadian Good Roads Association.

Through the kindness of the University Club the courtesies of the club are extended to all visiting members of **The Institute** during their stay in the city.

Committee on Deterioration of Concrete in Alkali Soils Meets at Calgary

A meeting of the Committee on Deterioration of Concrete in Alkali Soils was held Monday, June 5th at 10 a.m. in the Palliser Hotel, Calgary, Alta., followed by a visit to the Eastern Irrigation Block of the Canadian

Professor C. J. MACKENZIE, M.E.I.C.
Dean of Engineering, University of Saskatchewan;
Chairman of Committee on Deterioration of
Concrete in Alkali Soils

Pacific Railway where the use of concrete in the construction of various large irrigation structures was seen.

The following committee members were present:—Professor C. J. Mackenzie, chairman, University of Saskatchewan, Saskatoon, Sask.; Professor J. N. Finlayson, University of Manitoba, Winnipeg, Man.; W. P. Brereton, city engineer, Winnipeg, Man.; Dr. J. W. Shipley, University of Manitoba, Winnipeg, Man.; A. Blackie, city analyst, Winnipeg, Man.; H. McI. Weir, assistant city engineer, Saskatoon, Sask.; A. S. Dawson, chief engineer, Department of Natural Resources, C.P.Ry., Calgary, Alta.; Geo. W. Craig, city engineer, Calgary, Alta.; F. C. Field, city analyst, Calgary, Alta.; R. S. Stockton, Dept. of Nat. Resources, C.P.Ry., Strathmore, Alta.; A. W. Haddow, city engineer, Edmonton, Alta.; J. A. Kelso, provincial analyst, Edmonton, Alta.; Professor G. M. Williams, secretary, University of Saskatchewan, Saskatoon, Sask.

Dr. T. Thorvaldson of the University of Saskatchewan, Saskatoon, in charge of the committee's chemical research was also present as well as Fraser S. Keith, general secretary of *The Institute,* who stopped off on his way to the coast.

Chairman Mackenzie presented a report summarizing the progress made during the past year in the organization of the committee and in getting the physical and chemical research underway. The Research Council of Canada, the provinces, cities and interested corporations have contributed to the funds of the committee to the extent of $13,200 per annum and payments for two years are at hand. Expenditures for the first year amount to slightly more than half of the first annual contribution owing to delays in obtaining assistants of the desired qualifications in chemical research, in which direction most of the committee's efforts will be expended.

During the past year test specimens in the form of cylinders seven inches in diameter and twenty-one inches long were molded and exposed to alkali ground waters near Cassils, Alta., Grandora, Sask., and Winnipeg, Man. In these concretes there were included several different cements, different cement contents, aggregates from three localities as well as various integral waterproofing com-

Members of the Engineering Institute Committee investigating the Deterioration of Concrete in Alkali soils, at Bassano, Alberta, June 7th, 1922, the last day of a three-day meeting.

Front row from left to right: J. A. Kelso, A.M.E.I.C., Provincial Chemist, Edmonton; Sam. G. Porter, M.E.I.C., Supt. Operation and Maintenance, C.P.R., Natural Resources, Lethbridge, Alta.; Fraser S. Keith, M.E.I.C., General Secretary, E.I.C., Montreal; Alex S. Dawson, M.E.I.C., Chief Engineer, C.P.R., Department of Natural Resources, Calgary; A. McGuire, District Sales Manager, Canada Cement Co., Calgary; Prof. J. N. Finlayson, M.E.I.C., Professor of Civil Engineering, University of Manitoba, Winnipeg; Prof. Duff A. Abrams, M.E.I.C., Professor in charge Structural Materials, Research Laboratory, Lewis Institute, Chicago.

Rear row standing: Alex Fleming, Chemist, Canada Cement Co. Montreal; H. G. Angell, A.M.E.I.C., Engineer, C.P.R. Natural Resources, Brooks, Alta.; F. C. Field, City Chemist, Calgary; R. S. Stockton, M.E.I.C., Supt. Operation and Maintenance, Western Section, C.P.R., Dept. of Natural Resources, Strathmore, Alta.; A. G. Blackie, City Chemist, Winnipeg; O. W. Moore, Engineer, C.P.R. Dept. of Natural Resources, Brooks, Alta.; Dr. T. Thorvaldson, Professor of Chemistry, Univ. of Saskatchewan, Saskatoon, engaged by the committee to carry on the chemical research work; H. McI. Weir, M.E.I.C., Assistant City Engineer, Saskatoon; Professor C. J. Mackenzie, M.E.I.C., Dean of the Faculty of Engineering, University of Saskatchewan, and chairman of the committee; Dr. J. W. Shipley, Assistant Professor of Chemistry, University of Manitoba, Winnipeg; Chas. C. Elliott, A.M.E.I.C., Canal Supt., C.P.R., Dept. of Natural Resources, Brooks, Alta.; H. S. Van Scoyoc, M.E.I.C., Consulting Engineer, Canada Cement Co., Montreal; A. W. Haddow, A.M.E.I.C., Commissioner of Public Works, Edmonton; Ernest Ashton, Chemical Engineer, Lehigh Portland Cement Co.; W. P. Brereton, M.E.I.C., City Engineer, Winnipeg; and Geo. W. Craig, M.E.I.C., City Engineer, Calgary. G. M. Williams, A.M.E.I.C., secretary of the committee, was busy with the camera at the time.

Photo by courtesy, A. Griffin, supt. maintenance and operation C.P.R., Department of Natural Resources, Brooks, Alta.

pounds and surface coatings. This programme of field tests is to a certain extent a repetition of similar work carried on in previous investigations and is intended mainly to serve as a basis of comparison with such test specimens as will later be made as the result of the chemical research. Difficulty has been encountered in obtaining the services of a properly qualified petrographer in connection with the chemical research, but now that this position has been filled progress will be made in all phases of the work.

Professor G. M. WILLIAMS, A.M.E.I.C.
Professor of Civil Engineering, University of Saskatchewan, Secretary of Committee on Deterioration of Concrete in Alkali Soils.

Monday night the party travelled to Brooks, Alta., for a two day trip over the Eastern Irrigation Block of the Canadian Pacific Railway, where the structures of greatest interest were pointed out and explained by Mr. Dawson, who as chief engineer of the Natural Resources Department had charge of the design and construction of the work. The trip was made doubly enjoyable through the courtesy of the Department of Natural Resources in furnishing a sleeping car which remained with the party throughout its stay.

Tuesday was spent in viewing the headgates of the Bantry canal at Lake Newell and Brooks aqueduct a concrete structure two miles long which carries irrigation water across a broad valley. Inspection was also made of the concrete test specimens installed near Cassils during the previous fall. While signs of deterioration were apparent on some of the specimens, those specimens placed nearby by the Calgary Branch of *The Institute* were of greatest interest. Some of these latter specimens have been in the ground for a period of over three years and alkali action has progressed to such an extent that definite conclusions can be drawn. These tests are reported in detail by Mr. Dawson in the September, 1921 issue of *The Journal.*

Wednesday was spent in the vicinity of Bassano in inspecting the Bassano dam, a large concrete structure of the Ambrusen type and various concrete drops and headgates in that locality.

This trip was not only of interest but of the greatest value to the members of the committee in connection with their present investigations, illustrating the use of concrete in large structures in varying soil and water conditions, and emphasizing the practical considerations which influence and govern the use of concrete on works of large magnitude.

The Professional Engineers' Act of Ontario

In another part of this issue of *The Journal* appears the text of the professional engineering Act of the Province of Ontario, which was passed by the Provincial House on June 5th. This Act represents the result of many months of persistent work on the part of the engineers of Ontario under whose sponsorship it was submitted to the Legislature for consideration.

Ontario professional engineers, while appreciating the work of the Advisory Conference Committee, will regret that their splendid efforts where not attended by greater success and, while the present Act gives a slight measure of protection to the profession and public, the general feeling is that the future may see amendments that will more nearly approach the Committee's original plan.

One of the principal clauses, number thirty-four, of the original Bill, which would have brought this legislation in line with the similar Acts in the provinces of British Columbia, Manitoba, New Brunswick, Nova Scotia and Quebec, was altered before it was finally passed. This clause originally read as follows:—

"Any person in the Province of Ontario who, not being registered as a member of the Association in the Province of Ontario, or licensed by the Association;

- (a) *Practises as a professional engineer;*
- (b) *Usurps the function of a professional engineer;*
- (c) Uses verbally or otherwise the title of professional engineer, or makes use of any addition to or abbreviation of such title, or of any words, name or designation that will lead to the beliet that he is a professional engineer or a member of the association, *or that he is a person specially qualified to practise in any branch of professional engineering;*
- (d) Advertises himself as a professional engineer in any way or by any means.
- (e) *Acts in such manner as to lead to the belief that he is authorized to fill the office of or to act as a professional engineer;*

shall be liable upon summary conviction by any court of competent jurisdiction to a fine of not less than \$100 nor more than \$200 for the first offence, and to a fine not less than \$200 nor more than \$500 for any subsequent offence."

The words which were deleted in this clause are shown in italics, while it will be noted, by comparison with the Act, that subsection *d* of the original was changed to read "Advertises or holds himself out in any way or by any means as a member of the Association."

From this change it will readily be seen that the greater measure of protection aimed at in the original Bill, by its sponsors, has been reduced and that the Act, which has just been passed, provides for the formation of an Association of Professional Engineers to which membership is voluntary, but at the same time restricts the use of the title "Professional Engineer" or any abbreviation thereof, or any similar designation to those who are members of the "Association of Professional Engineers of the Province of Ontario."

Recent Honours and Degrees

The congratulations of *The Institute* are extended to the following members who have recently graduated from the University of Toronto.

Honour Graduates with Degree of B.A.Sc.

Students in The Institute: George Arthur Day, B.A.Sc., (Chem. Eng.), Guelph, Ont.
James William Simpson Gibbs, B.A.Sc., B.A.Sc., (Civ.), Toronto, Ont.
Harold Glendon Hayman, B.A.Sc., (Civ.), Toronto, Ont.
John Archibald C. Kay, B.A.Sc., (Chem. Eng.), Stratford, Ont.
Ronald James McGrath, B.A.Sc., (Civ.), Toronto, Ont.
Herbert Hugo Mueller, B.A.Sc., (Chem. Eng.), Toronto, Ont.
William Ray Richardson, B.A.Sc., (Chem. Eng.), Essex, Ont.
Màlcolm Dunlop Ross, B.A.Sc., (El.), Chatham, Ont.
Simcoe Crawford Scadding, B.A.Sc., (El.), Humber Bay, Ont.
Henry Maurice Shockley, B.A.Sc., (El.), Prince Rupert, B.C.
John Harvey Westren, B.A.Sc., (Chem. Eng.), Toronto, Ont.
Lewis Alfred Guy Winter, B.A.Sc., (Chem. Eng.), Toronto, Ont.

Graduates with Degree of B.A.Sc.

Juniors in The Institute: Thomas Stanley Glover, B.A.Sc., (Civ.), Southfield, Hessle E. Yorks, England.
Bruce Henry Johnston, B.A.Sc., (El.), Toronto, Ont.
Students in The Institute: Alexander MacGregor Anderson, B.A.Sc., (Civ.), Toronto, Ont.
Wilfred R. Benson, B.A.Sc., (El.), Toronto, Ont.
Carl Louis Breithaupt, B.A.Sc., (Chem.), Kitchener, Ont.
George Fraser Bryant, B.A.Sc., (El), Midland, Ont.
David Burns, B.A.Sc., (El), Fullerton, California, U.S.A.
William Alexander Campbell, B.A.Sc., (Chem.), Toronto, Ont.
Clarence Hale Carslake, B.A.Sc., (Chem.), Toronto, Ont.
Howard McDougall Chantler, B.A.Sc., (Chem.), Toronto, Ont.
Wilfred Laurier Clairmont, B.A.Sc., (Civ.), Gravenhurst, Ont.
Terence Clarke, B.A.Sc., (El), Toronto, Ont.
Robert Harold Burton Cook, B.A.Sc., (Civ.), Aurora, Ont.
Stanley Lytton Coulter, B.A.Sc., (El.), Windsor, Ont.
James Jackson Crawford, B.A.Sc., (Chem.), Toronto, Ont.
Prosper Gerald Dunbar, B.A.Sc., (Me.), St. Thomas, Ont.
George Balderstone Fuller, B.A.Sc., (El.), Arkona, Ont.
Wilfred John Grant, B.A.Sc., (Chem.), Toronto, Ont.
Herbert Patrick Graves, B.A.Sc., (El.), London, Ont.
Alfred George Guscott, B.A.Sc., (Civ.), Toronto, Ont.
George Hammond Harlow, B.A.Sc., (Mech. Engr.), Toronto, Ont.
Albert Harold Heatley, B.A.Sc., (Chem.), Brampton, Ont.
Harold Edwin Howden, B.A.Sc., (El.), Caledonia, Ont.
Howard Hillen Kerr, B.A.Sc., (Mech. Eng.), Seaforth, Ont.
John Alexander Langford, B.A.Sc., (El), Calgary, Alta.
Michael Milinocket Montemurro, B.A.Sc., (El.), North Bay, Ont.
Harold Anthony Oaks, B.A.Sc., (Mi.), Preston, Ont.
Francis Jones Pollock, B.A.Sc., (Civ.), Almonte, Ont.
David Wellesley Rosebrugh, B.A.Sc., (El.), Toronto, Ont.
Frank Stephens Spence, B.A.Sc., (Chem. Eng.), Toronto, Ont.
John Greer Spotton, B.A.Sc., (El.), Guelph, Ont.
Malcolm Davidson Stewart, B.A.Sc., (Civ.), Montreal, Que.
Howard Grant Thompson, B.A.Sc., (Mech.), Belmont, Ont.
Frank Lloyd Wass, B.A.Sc., (Chem.), St. Marys, Ont.
Harold Stanley Weldon, B.A.Sc., (El.), Oakwood, Ont.
Stephen Williams, B.A.Sc., (Mech.), Toronto, Ont.

Degree of M.A.Sc.

A.M.E.I.C.: William Kirk Thompson, M.A.Sc., (Met.), Toronto, Ont.
Jr.E.I.C.: Chester Arthur Hughes, M.A.Sc., (Civ.), Mimico Beach, Ont.
S.E.I.C.: Morland Powers Whelen, M.A.Sc., (El.), Toronto, Ont.

* * *

Creosoted Fence-Posts Outlast Cedar

For many years it has been thought that the only timber that would give a reasonable period of service as fence-posts was cedar. The Forest Products Laboratories of the Department of the Interior, Canada, state, however, that by employing a comparatively simple method it is possible to treat posts of certain hardwoods in such a way that they will have a life at least twice as long as cedar posts. The preservative effect of this treatment is clearly shown in fencing erected at the Dominion Forestry Branch forest nursery at Indian Head in 1917. Here posts of Russian poplar were used, both treated and untreated, and it is interesting to note that all the untreated posts erected at this time have decayed and been removed while the treated posts are all still in service and appear as sound as the day they were placed in position.

OBITUARIES

Charles Garden, M.E.I.C.

Sincere regret is expressed at the death of Charles Garden, M.E.I.C., which occurred in Woodstock on May 21st, 1922. Mr. Garden was born at Upper Woodstock some seventy years ago and was educated there at a school conducted by William McIntosh and at the Carleton County Grammar school under the head mastership of James McCoy. His first venture in the engineering field was during a vacation, when he filled the position of "back picket" on the first survey of the Woodstock branch of the St. Andrews and Quebec railway, made by James R. Hartley, C.E. From this time he did surveying work off and on assisting his father. His father died when he was nineteen years of age and although still a boy, Charles Garden was appointed a provincial land surveyor. In 1879 he was engaged with his brother, Edward Garden, C.E., on government work east of Rat Portage. Perhaps his most important work was in connection with the building of the C.P.R. through the Rockies. He was one of the advance guard of the exploration party. The route of this party was via the N.P.R., to Bismark, Dakota, up the Missouri to Benton and thence by trek to Calgary and up the Bow. Only one party came over the Rockies summit. This party was in charge of Mr. McMillan with Mr. Garden as transitman and consisted of fifteen men. They came through the Vermillion, south of the Kickinghorse and made their way to what is now called "Golden". They built "The Cache" which has ever since remained, with, of course, extensive restorations and is now known as "Moodie's House."

In 1884-85 Mr. Garden worked on C.P.R., construction near lake Superior on White river, Peninsula Harbour, and it was at this time that the first through C.P.R. train went to Vancouver. He was later engaged on construction on the Deloraine branch to the coal mines for the C.P.R. He had charge of location and construction on Souris branch and was for some years in office work in Winnipeg. In 1897 he was on the location of the Crow's Nest branch, locating the loop and tunnel at Michael Creek. In 1898 he was employed by McKenzie & Mann at Rainy River and Fort Francis. For this same concern he afterwards located for the Swan river winter survey and in the summer following he located a line across Red Deer river.

In 1901 he was on the Algoma Central, Sault Ste. Marie to Michipocata Iron Mines and in construction work at Trout Lake, Chippewa and Mackie Creek. In 1903 he was in St. Paul as an expert witness in a railway case between Foley Bros. and Cook and the side for which he testified, won.

Coming nearer home, Mr. Garden was engaged on the Transcontinental survey between Grand Falls and Andover, on the Woodstock Shogomoc branch and in the Minto Chipman district. Among his many activities he was engaged on the Vancouver Electric Railway.

Within a few years past ill health caused Mr. Garden to retire from active work, and he returned to Woodstock.

Mr. Garden, who has been connected with *The Institute* for many years, was made a Life Member on March 21st last.

He is survived by his widow, formerly Miss Alice Connell, and one sister, Mrs. R. Wilmot Balloch.

Sydney Stuart Jones, Jr.E.I.C.

Regret is expressed at the news of the death of Sydney Stuart Jones, Jr.E.I.C., which occurred at his home in Dorval, Que., on May 19th, 1922, after a long illness resulting from an attack of pneumonia last August. The lat eMr. Jones was born at the Isle of Man on January 31st, 1895, where he attended Murrays Road Public School for six years, after which he came to Canada and received his high school and technical education in Montreal.

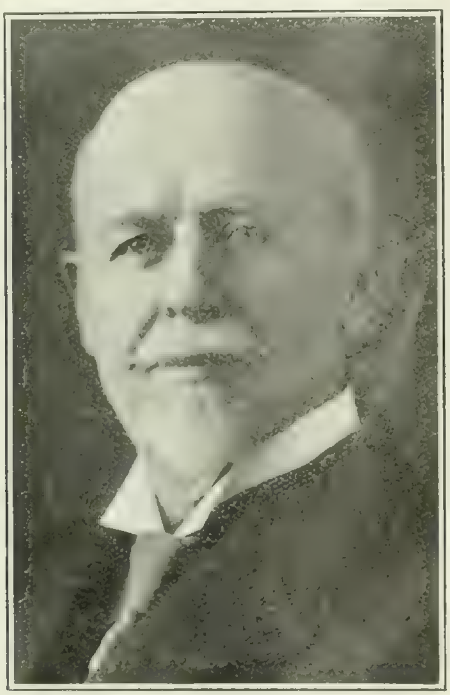
Mr. Jones commenced his engineering work in August 1912, on the construction and location surveys of the Canadian Pacific Railway. In the following year he was employed as assistant instrumentman and draughtsman under M. D. Barclay, D.L.S., on land surveys in Montreal. From 1913 to March 1915 his work was in connection with railway surveys in Ontario, New Brunswick and Nova Scotia, while a similar line of work took him overseas with theCanadian Railway Construction Corps from March 1915 to August 1918, after which he was attached to the Royal Garrison Artillery as Lieutenant Instructor until the end of the war. On returning to Canada he again took up his work on railway surveys in New Brunswick and Nova Scotia. In March, 1920, he was appointed to the staff of the Department of Soldiers Civil Re-establishment, Engineering Branch, as draughtsman on building construction and maintenance in Montreal, which position he left in June 1920 to accept an appointment with the Riordon Company at Temiskaming, Que., in connection with the planning and construction of the new town-site.

Herbert L. Wallis, M.E.I.C.

The death of Herbert L. Wallis, M.E.I.C., at his home in Montreal on May 24th last, has taken from *The Institute* one of its earliest and most eminent members, and from the engineering profession one of the outstanding figures in the early history of the engineering development of

our Canadian railways. Mr. Wallis was intimately known to all the older members of *The Institute* and to a great many of the younger members. He was one of the signatories of the Charter of the Canadian Society of Civil Engineers, and as such, his name is known to the entire membership as one of the founders of *The Institute*, one of the few men who in the early eighties, looking into the future, laid so lasting a foundation upon which to build a society to serve the profession.

The late Mr. Wallis was born at Derby, England, in 1844 and was educated at the Moravain School, Ockbrook, near Sowerby Bridge. Upon the completion of his schooling, he was apprenticed to the late Matthew Kirtley, locomotive superintendent of the Midland Railway, under whose mentorship he remained for five years.



HERBERT L. WALLIS, M.E.I.C.

In 1866 he was appointed foreman in charge of the locomotive department of the Midland railway at Bradford, the district connected with the same being also under his control. He remained in the employ of the Midland Railway Company until May 4th, 1871, when he sailed for Canada to assume the position of assistant mechanical superintendent of the Grand Trunk Railway with headquarters in Montreal. About two years after he was appointed chief mechanical superintendent, which position he held until he retired in 1896.

To enumerate the many improvements brought about under Mr. Wallis' supervision, during his quarter of a century service with the Grand Trunk Railway Company, would not be possible in the present instance, but mention must be made of the fact that the first compound locomotive upon the Grand Trunk Railway was built by Mr. Wallis and that he was instrumental in improving the shops of the company to such an extent that they were able to construct practically all the new locomotives for service during the last twenty years of his tenure of office.

In the commercial life of Canada, as well as in the engineering profession, Mr. Wallis was held in very high esteem. Among his many official positions are those of Vice-President of the Ottawa River Navigation Company, and President of the Carillon and Grenville Railway Company. Mr. Wallis was a member of the Institution of Mechanical Engineers of England and also of the Institution of Civil Engineers of Great Britain.

Mr. Wallis' membership in *The Engineering Institute of Canada* dates from January 20th, 1887, five months before the Charter of the Canadian Society of Civil Engineers was granted. During that year he was a member of the Council of the Society, while for the six succeeding years he was treasurer. In 1894, he was elected vice-president, which office he held until chosen as president for the year 1896. The following year Mr. Wallis presented a paper before the Society on "Fuel for Locomotives", which was published in the transactions of that year. Thus for the first nine years in the history of *The Institute*, (then the Canadian Society of Civil Engineers), is to be found the name of the late Mr. Wallis among the officers of the Society, during which time he devoted his best efforts in the building of *The Institute* of to-day.

Mr. Wallis is survived by his wife, formerly Miss Ida Boulter, and two sons, Haden Wallis, who is attending Ashbury College, Ottawa, and Master William Herbert Wallis of Montreal, and two daughters, the Misses Elsie and Marjorie Wallis.

Velocity Stage Turbines

Velocity Stage Turbines. A line of velocity stage turbines especially designed for high pressure and high temperature steam is described in a 28-page catalogue issued by the De Laval Steam Turbine Co., of Trenton, N.J. The cast steel steam chest is located in the casing cover in order to avoid the conduction of heat to the bearings. In addition to the speed governor and governor valve, there is an independent valve controlled by an automatic overspeed trip. The turbines are built in sizes up to 1200 hp., and are designed to be directly coupled to high speed centrifugal pumps and blowers, small A.C., and D.C., generators, and by means of double helical speed reducing gears, to large pumps and blowers, medium size generators, belt pulleys, rope sheaves and slow and moderate speed machinery.

PERSONALS

H. G. McVean, A.M.E.I.C., is leaving Regina shortly to be in Toronto for a year.

J. R. Wood, A.M.E.I.C., formerly of Evesham, Sask., is now with the Imperial Oil Company at Regina.

K. O. Elderkin, Jr.E.I.C., has accepted a position with the St. Lawrence Paper Mills, at Three Rivers, Que.

E. E. Holmes, S.E.I.C., has accepted a position with the Wayagamack Pulp and Paper Company at Three Rivers, Que.

Cuthbert J. Oliver, S.E.I.C., Sci., '23, McGill University, is with the Manitoba Power Company, Winnipeg, Man., for the summer months.

H. Jardine, S.E.I.C., of Hespler, Ont., who was for a time assistant engineer at Timmins, Ont., has been appointed assistant city engineer of Galt, Ont.

R. A. de-Valter, A.M.E.I.C., assistant engineer' Department of Public Works of Canada at Sherbrooke, has been transferred to the district of Quebec.

H. M. Morrow, A.M.E.I.C., formerly with the Dominion Iron and Steel Company has become associated with the firm of N. B. Stark and Company, Montreal.

R. B. Jennings, A.M.E.I.C., division engineer with the Canadian National Railways has been transferred from Ottawa to the Tunnel Terminal Station, Montreal.

E. A. Earl, A.M.E.I.C., who was for some time at the Gold Coast in West Africa is at present in England, residing at "Dumbarton", 192, Brixton Hill, London, S.W.

F. H. Kitto, M.E.I.C., who has been in Winnipeg for some time on business for the Natural Resources Intelligence Branch of the Interior Department, has returned.

C. E. Malone, Jr.E.I.C., who received his B.Sc., degree in Civil Engineering from Queen's University this spring is located with D. A. R. McCannel, city engineer of Regina.

Gabriel Henry, A.M.E.I.C., has been appointed consulting engineer to the Roads Department of the Province of Quebec, of which department, he was formerly chief engineer.

H. G. Thompson, S.E.I.C., who graduated in Applied Science from the University of Toronto this year, has been appointed to the staff of the American Blower Company, at Detroit, Mich.

Robert Hobson, M.E.I.C., president of the Steel Company of Canada, was elected vice-president of the Canada Steamship Lines at the annual meeting held in Montreal during May.

W. L. Dethloff, M.E.I.C., formerly chief engineer with the Mond Nickel Company, Ltd., at Coniston, Ont., is now located at Clearfield, Pa., U.S.A., with the American Nickel Corporation.

A. F. Macallum, M.E.I.C., commissioner of works, for the city of Ottawa, attended the Good Roads Convention at Victoria, B.C., representing the city and the Ottawa Branch of the E.I.C.

The Saskatchewan Branch was represented at the British Columbia Professional Meeting by H. R. Mackenzie, A.M.E.I.C., H. S. Carpenter, M.E.I.C., Regina, and A. M. McGillivray A.M.E.I.C., Saskatoon.

D. J. Emrey, Jr.E.I.C., who graduated this year from the Queen's University, has joined the staff of the Canadian Des Moines Steel Company, Ltd., in their Bridge Department at Chatham, Ont.

Major C. R. Crysdale, M.E.I.C., of Vancouver, left last September for British West Africa. His mailing address is now c/o Stewart and McDonald, Gold Coast Harbours, Seccondee, British West Africa.

H. R. McClelland, M.E.I.C., vice-president and general manager of N. E. McClelland and Company, is at present in the Old Country at the London office of the company at 53, Victoria Street, London, S.W.1.

Andrew J. Riddell, A.M.E.I.C., who was formerly with Gilbert J. P. Jacques, architect, Windsor, Ont., has now opened an office, under his own name, as architect and engineer at 355, Sandwich Street, Sandwich, Ont.

R. L. Weldon, A.M.E.I.C., for some time on the staff of the Three Rivers Pulp and Paper Company, Ltd., is now mechanical engineer at Three Rivers, Que., with this company, which is now operating under the name of the St. Lawrence Paper Mills, Ltd.

A. M. Alberga, Jr.E.I.C., formerly assistant engineer on forest exploration for the Wayagamack Pulp and Paper Company of Three Rivers, Que., is now with the engineering service of the Dominion Parks Branch, Department of the Interior, Ottawa, Ont.

S. B. Wass, A.M.E.I.C., construction engineer with the Canadian National Railways, has been transferred from Moncton, N.B., to Toronto, Ont. While at Moncton Mr. Wass had charge of the construction of the new railway yard and engine facilities at that point.

H. R. Lynn, A.M.E.I.C., formerly general manager of the Canada Slate Corporation is now a partner in the firm of Lynn MacLeod Engineering Company, Thetford Mines, P.Q., the many activities of the firm being expressed in the phrase, "Mining and Engineering Requirements".

Lucius E. Allen, M.E.I.C., formerly consulting engineer at Belleville, Ont., has opened offices in the First National Bank Building in Detroit, Mich., where he is continuing consulting engineering work and specializing in highway engineering in the United States and Canada.

F. O. White, M.E.I.C., who was previously located at Orono, Maine, has accepted the position of chief engineer of the St. Lawrence Paper Mills, Ltd., formerly the Three Rivers Pulp and Paper Company Ltd., and is in charge of the construction of the new mill at Three Rivers, Que.

James Ewing, M.E.I.C., of Montreal, has formed a new partnership with Altheod Tremblay, A.M.E.I.C., with offices in the Birks Building, the former firm of Ewing, Lovelace and Tremblay having been dissolved. Mr. Ewing intends to carry on his specialized work in town planning.

C. W. Dill, M.E.I.C., vice-chairman of the Saskatchewan Branch has resigned his position with the Provincial Government. He was chief engineer and superintendent of highways in the Department of Highways. Mr. Dill has been on the verge of a nervous breakdown and is at present in Vancouver for his health.

Col. Wm. G. Attwood, Member Am. S.C.E., director of the Committee on Piling Investigation with the National Research Council of the United States, was in Ottawa recently in consultation with the chief engineer of the Public Works Department, with a view to arranging effective co-operation in the study of destructive marine borers on the Atlantic and Pacific coasts.

Major L. E. Silcox, D.S.O., M.E.I.C., formerly locating engineer for the western lines of the Canadian National Railways, Winnipeg, Man., has gone to Gold Coast Harbours, Seccondee, Gold Coast, British West Africa. Major Silcox is the second of *The Institute's* members who has recently been reported as moving to this part of British West Africa and news from these distant members would be welcomed by *The Journal* readers.
